### EXTRACT

*From an Act prescribing Rules for the Government of the State Library,  
passed March 8th, 1861.*

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

Number 1.

## Improved Tank Locomotive.

To Mr. M. N. Forney, mechanical engineer, who is the able New York correspondent of our valuable cotemporary, the *Chicago Railroad Gazette*, we are indebted for the engraving of the accompanying tank locomotive of his design.

The special object of this design is to effect a great reduction in weight and cost as compared with the ordinary 8-wheeled locomotives now in general use. The common American 8-wheeled locomotive carries less than two-thirds of its weight on the driving-wheels. Now a 4-wheeled switching engine, weighing 18 tons, has all its weight on the driving-wheels, and consequently will draw as many cars as an 8-wheeled engine weighing 29 tons. But the lighter locomotive cannot be substi-

receive the tank, and placing a truck underneath to carry the weight of boiler and fuel. Thus a long wheel-base is obtained which adjusts itself to the curvature of the track, while the whole weight of the engine proper is carried on the driving-wheels. This secures the steadiness of the 8-wheeled locomotive and the adhesion of the one with four wheels.

On tank locomotives the weight of the water and fuel should never be carried on the driving-wheels, because, when the tanks are full, the weight may be sufficient to injure the track, and, when empty, there is not sufficient adhesion. Hence, in this engine, all the permanent weight of boiler and machinery is carried on the driving-wheels, and the variable weight of water and fuel on the truck.

It is safer to run an ordinary locomotive

to keep open a communication to a separate tender, while in summer the hot air from the boiler is carried out of, instead of into, the cab. Thus the cab is warmer in winter and cooler in summer. The foot-board is between the driving wheels and truck, or near the center of the engine, in the steadiest and most comfortable place for the engineer and fireman. These engines will answer a very good purpose for switching, but are intended for general freight and passenger business. They will do any work possibly performed by ordinary locomotives of not over 28 to 30 tons weight, and are especially adapted for light traffic or branch-road service. Engines of this plan, of various sizes, from 12 to 35 tons weight, and with cylinders from 6 to 15 inches diameter, will be furnished by Mr. M. N. Forney, No. 72

**MORE NATURAL CURIOSITIES.**—The *Fresno Expositor* learns from Mr. Powell, a civil engineer of Fresno county, that near the confines of Fresno, Tulare and Inyo counties, in the vicinity of the headquarters of the Keweah, there exists a remarkable piece of country. The Indians say it is the abiding place of the Evil Spirit. The country is rugged and rocky mountains, with deep valleys and precipitous cliffs. Snakes and reptiles of every description abound in untold numbers, and, taken in all, it is a wild and most uninviting region. But aside from this a most curious phenomenon exists. The ground trembles and quakes almost continuously, and the abundant rocks grind and grit together as if being urged by some terrible influence. Frequently deep discharges are heard, muffled and dull, like the distant

NEW TANK LOCOMOTIVE, DESIGNED BY M. N. FORNEY.

tuted for the heavier one on account of its unsteadiness, arising from the shortness of its wheel-base. It is necessary to place the wheels close together, in order to pass around short curves easily. So great is the objection to placing the wheels far apart, that in this country nearly all locomotives which are designed to run at any speed, are built with a truck which is connected with the engine so that the wheels can adjust themselves to the curvature of the track. It is found necessary, in order to keep the truck on the track, to load it with about one-third the weight of the locomotive; this reduces the weight on the driving-wheels and consequently their adhesion. That is, over a third of the weight of the locomotive is sacrificed in order to have a long and flexible wheel-base and a steady-running engine.

The locomotive here illustrated obviates this trouble, not only by carrying all the weight of the boiler and machinery on the driving-wheels, but also by extending the frame beyond the fire-box far enough to

on a crooked road with the truck ahead rather than behind. The source of danger is not in the position of the truck, but in the rigidity of the rear wheels. For this reason, in this design the engine is intended to run with the truck ahead. This brings the boiler, smoke stack, etc., behind,—a plan which, instead of being disadvantageous, is claimed to have some advantages. The most noticeable of these is the influence of the motion of the locomotive (in the opposite direction to that of the air and the smoke in the tubes) on the draft. It stimulates the draft, which is retarded in the common method. Again, this disposition gives an unobstructed view of the track, and there is no liability of its being obscured by smoke or escape steam, the latter often forming a serious inconvenience, especially in cold weather, when the condensed water freezes on the cab windows.

The cab of a tank engine of this plan can be entirely enclosed in cold weather, it not being necessary (as on an ordinary engine)

Broadway (Room 7), New York City.

**HYDE STEAM WAGON.**—The *Coriune Journal* says the Hyde overland steamer was trotted out the other day, and gave satisfaction even to the croakers, all hands having a free ride. It is to be shipped at once to Lake Point and put to work hauling ore, etc. The *Reporter* says: It appears to swing around in the road, at command of the steering apparatus, easier than a man could turn a wheelbarrow on a matched floor! This great engine will draw its thirty or forty tons of freight in trained vans or wagons as readily as it moves unloaded. It is the king of the road in every way. In twenty feet it turns completely around going at its speed, stops with the touch of a valve, and when desired to move, on takes up its march with a step that ordinary obstruction cannot retard.

**POLAR RESEARCH.**—Mr. A. L. Pinart left this city a few months since for Alaska to investigate the scientific and commercial resources of that country.

sound of heavy artillery. At night the sounds seem to be more abundant than in day time. No Indian can be induced to venture near the locality, regarding it with superstitious horror. No theory is advanced by any one to account for the strange phenomena mentioned. We also learn from William Faymonville that above the head of Crane Valley, in this county, another place similar to the one mentioned exists. Parties who have visited the last place named describe the sounds mentioned as like muffled thunder.

**AUSTRALIA MINERALS.**—We have been shown a catalogue of mineral specimens, sent by Capt. H. R. Hancock, Superintendent of the Moontamines, of South Anstralia, as a present to the University of the Pacific. The ores are all of copper. The Moonta mines yield an annual product of 4,600 tons of pure bar copper.

The Sutro Tunnel Commissioners having reached Virginia City, the papers there are interviewing them.

## MECHANICAL PROGRESS.

**THE HELIOTYPE PROCESS.**—In *Nature* for June 1st, W. H. Harrison describes the late improvements by Mr. Ernest Edwards. We quote from the part in reference to the working details:—"The films are prepared upon large sheets of accurately leveled finely ground glass, technically known as 'greyed glass,' about 22 inches by 18 inches is a convenient size. The surface of the glass is first polished by means of a clean piece of rag, with a little solution of wax in ether; the exceedingly thin film of wax thus left upon the glass permits the dried gelatine film to come off easily. The glass plates after being waxed are leveled, and then a measured quantity of a warm mixture of gelatine, bichromate of potash, chrome alum, and water, is poured upon each plate from a jug with a piece of muslin tied over its mouth. The temperature of the solution in the jug is about 150° Fah., and after it is poured over the plate it sets in a very few minutes, but it requires a much longer time to dry. Curiously enough, until it is dry it is not sensitive to light; this fact was found out accidentally, for at first this part of the operations was carefully carried on in yellow light. After the film is set, the plates are taken into a dark room to dry. If any of the fumes given off by burning gas escape into this room, they act upon the film just as light would do, therefore although a gas stove is used to dry the plates, the products of combustion are very carefully carried off. \* \* At a temperature of 90° the films take about twenty-four hours to dry. As they dry they contract slightly, and thus separate themselves from the glass. These dried films are technically termed 'skins,' they are of an orange color, and about one-tenth of an inch thick. The picture is printed on them from a negative, and a faintly visible image is formed; when this image is fully out the films are removed to a dark room. Here each skin is floated in water, and caught upon the surface of a thick plate of zinc; a flat piece of wood, edged with india-rubber is then scraped with considerable pressure over the film, so as to squeeze out all the water between the skin and the zinc. As the film still continues to absorb moisture, it is thus fixed to the zinc with the whole pressure of the atmosphere. After this the zinc with its attached film is left for half an hour at least in a large vessel of water, for the superfluous bichromate of potash to soak out, and then the film is no longer sensitive to light. If the film be thus soaked for several hours, or even days, it does not suffer. The film, upon its zinc plate, is now ready for the printing press. It is damped between each impression, just like a lithographic stone. Then it is inked, and the best roller for the purpose is found to be one made of india rubber, backed inside with 'india-rubber sponge' to give additional softness. Ordinary lithographic ink is used. If stiff lithographic ink be employed, the surface will only 'bite' where light has acted most; if thin ink be used, the leathery surface will only bite in the half tones of the picture; hence each picture is produced by two inkings, and advantage is taken of this circumstance to use two colors, and get warm shades in the half tones. It is very interesting to see the picture gradually growing under the inking process. By this method double-printing is executed with a single pull at the press."

**DUCKHAM'S HYDROSTATIC WEIGHING MACHINE.**—We copy the description from the *Engineering and Mining Journal*:—"The apparatus is simply composed of a piston and cylinder, which may be suspended for use from any crane hook; it is filled with water, which has a connection with an ordinary hydraulic pressure gauge fixed on the exterior of the machine. The piston rod passes downward through the cylinder bottom, and forms a means of attachment for the goods. Immediately these are lifted, as in loading or unloading ships or wagons, the weight is shown on the gauge dial without the slightest extra labor or manipulation, and, consequently, without cost. The piston is fitted with cupped leathers of such a shape as entirely to obviate leakage, as the water cannot escape, and is in itself incompressible. There is no movement of the piston, and, consequently, no friction to affect the accuracy of the weight denoted. Moreover, to insure absolute correctness, each dial is marked to indications given by the attachment of actual adjusted weights or strains to each machine. One of the most notable

worthy features in connection with this invention is, that whereas the few weighing contrivances which exist in other design of large capacity are almost too unwieldy to be worked at all, a Duckham 30-ton machine complete weighs only 2½ cwt. It may be transported from place to place and attached for use by a single man. The 1-ton machine has a piston area of only 7 in., and weighs only 18 lbs. It is only necessary to regulate the strength of the metal to obtain a weighing machine light and delicate for low weights, or a machine combining in an eminent degree lightness and portability, but of sufficient power to indicate any amount of strain which can be possibly applied to it."

**PRESSURE OF FIRED GUNPOWDER.**—In a lecture before the Royal Institution, Capt., Andrew Nohle, F. R. S., describes the latest experiments upon the firing of gunpowder in closed chambers. We quote the conclusions drawn therefrom:—"The maximum of pressure of fired gunpowder, unrelieved by expansion, is not much above 40 tons to the square inch. (2) In large guns, owing to the violent oscillations produced by the ignition of a large mass of powder, the pressure of the gas is liable to be locally exalted even above its normal tension in a perfectly closed vessel, and this intensification of pressure endangers the gun, without adding to useful effect. (3) Where large charges are used quick-burning powder increases the strain upon the gun, without augmenting the velocity of the shot. (4) The position of the vent or firing point exercises an important influence on the intensity of wave action, and in further enlarging the dimensions of heavy guns we must look to improved powder and improved methods of firing the charge, so as to avoid as much as possible throwing the ignited gases into violent oscillation. (5) That in all cases it is desirable to have the charges as short as possible, so as to reduce the run of the gas to the shortest limit. Hence increase of the diameter of the gun by shortening the charge tends to save the gun from abnormal strains."

**ELECTROTYPE IMITATION OF LEATHER.**—The following is from the *Mechanics' Magazine* for May 12th:—"Messrs. Elkington & Co., of Birmingham, have arranged to produce by the electrotype process, imitations of the choicest grains of leather, by means of electro-deposited copper rollers. The system may be briefly described as follows:—An ordinary machine roller is fitted with a mandrel, upon which is deposited, by a new process, the copper facsimile. The latter is an exact copy of any rare or choice skin required to be reproduced, and it is only by a recent improvement in electrotyping that the difficulty of depositing from such a substance as leather has been surmounted. An ordinary skin can thus be impressed with the beautiful surface of morocco skin, even to the finest variations of grain, and several thousand may be copied by one deposit. In all cases the actual skin required to be copied must be sent. The rollers are supplied ready for the machine; or, if preferred, manufacturers may send their own mandrels and have the fac-simile deposited thereon."

**INVENTION FOR BURNING LOCOMOTIVE SPARKS.**—We find this in the editorial correspondence of the *Chicago Railroad Gazette*, June 17th:—"In Worcester, Mass., I had an opportunity to examine Mr. Griggs' invention for burning sparks, which is novel, and which according to his account produces remarkable results in the economy of fuel. It consists of a bell-mouthed pipe placed inside the stack in the position usually occupied by the deflector. This pipe extends from the top of the stack backward to the top of the boiler in front of the cab. Thence it branches down on each side of the boiler and connects with openings in the fire box. By this means, all the sparks which are collected by the bell-mouthed pipe are carried back into the fire-box and have a second chance of being consumed."

**IMPROVED METHOD OF TINNING CAST-IRON.**—"The surface of the cast-iron objects is decarbonized by keeping it for several days in closed vessels with powdered hematite, under the influence of a red heat, until a sample taken out, after being properly cleaned, will take the tinning as easily as wrought-iron. Then the object is slowly cooled, taken out, placed in an acid bath, and plunged in the melted tin alloy, the surface of which is covered with fat or tallow, to prevent oxidation."—*Manufacturer and Builder*.

## SCIENTIFIC PROGRESS.

**DIAMAGNETIC EXPERIMENTS.**—London *Engineering* for June 9th says that the chief novelty at the Royal Institution Conversazione on the 6th was the exhibition of electrical apparatus. We quote a paragraph:—"A powerful electro-magnet was exhibited by Lord Lindsay, and the following magnetic and dia-magnetic experiments were conducted with it and some vacuum tubes belonging to Mr. Cromwell Varley. The poles of the magnet, 2½ in. square in section, were kept 3-16th of an inch apart. A half-crown placed between the poles, when the magnet was not excited of course dropped instantly through, but when the magnet was charged the half-crown was six seconds in falling the distance of 2½ in. In a second experiment a small india-rubber tube, filled with mercury was placed between the poles, and an electric current passed from the battery through the mercury; as soon as the magnet was excited the tube instantly took motion, getting out from between the poles, and curling itself in the form of the letter S, while by reversing the current, the shape of the curve was instantly reversed. Next a coil of copper wire was placed round the vertical pole of the magnet. When the magnet was charged, and a current of electricity sent through the copper coils in one direction, the ring of fine copper wire stuck fast to the magnet. On reversing the electric current, the ring jumped off the pole of the magnet some distance in the air. A lighted taper was then passed through a hole bored along the poles, the light being brought to the space of one-eighth of an inch wide between the two poles; as long as the magnet was excited the light burned brilliantly, the smoke coming out at the extreme ends of the poles, and not rising up directly off the flame, but as soon as the magnet was discharged the smoke rose straight up and suffocated the flame, which was then extinguished. This experiment showed the dia-magnetic properties of warm air. Mr. Cromwell Varley exhibited tubes of various descriptions, to show that the luminous arch was dependent wholly upon the magnetism, and independent of the direction of the electric current. This arch, discovered by Plücker, has been examined by Mr. Varley, and found to consist of very attenuated matter thrown off from the negative pole. This has been demonstrated in the following manner:—A strip of talc 1-10 in. broad and 1 in. long, weighing 1-10 of a grain, is suspended in the exhausted tube by means of a single fibre of raw silk. When the arch is allowed to play against this piece of talc it is repelled by it. The luminous arch does not burn the silk, yet where it strikes the glass tube it makes the tube hot; from which Mr. Varley infers 'that the electric current passing into the negative pole detaches small particles of matter therefrom, which particles are thrown off with tremendous rapidity, and controlled in their course by the magnetic rays forming the luminous arch, and that the heat in the glass is produced by the concussion of these particles against the solid body.' Lord Lindsay, who is now becoming a well-known experimenter, and who has a very large physical laboratory, was present, and conducted many of the experiments himself. The magnet was excited by a 30-cell Grove battery."

**THE GENERAL OCEANIC CIRCULATION.**—From *Nature* for June 8th:—"Having ascertained the existence of an outward under current in the Strait of Gibraltar, which carries back into the Atlantic the water of the Mediterranean that has undergone concentration by the excess of evaporation in its basin, Dr. Carpenter applied himself to the consideration of the forces by which the superficial in-current and the deep out-current are sustained; and came to the conclusion that, as had been previously urged by Captain Maury, a *vera causa* for both is to be found in excess of evaporation, which at the same time lowers the level and increases the density of the Mediterranean column as compared with a corresponding column of Atlantic water. This conclusion, when scientifically worked out, was found to be applicable, *mutatis mutandis*, to the converse case of the Baltic Sound; in which, as was long ago experimentally shown (with a result that has recently been confirmed by Dr. Forchhammer), a deep current of salt water flows inwards from the North Sea, whilst a strong current of brackish water sets outwards from the Baltic, the amount of fresh water that drains into which is greatly in excess

of the evaporation from its surface. Comparing, then, the Polar and Equatorial areas, it is shown by Dr. Carpenter that there will not only be a continual tendency in the former to a lowering of level and increase of density, which will place it in the same relation to the latter as the Mediterranean bears to the Atlantic, but that the influence of Polar cold will be to produce a *continual descent* of the water within its area; thus constituting the *primus mobile* of the General Oceanic Circulation, of which no adequate account had previously been given. This conclusion has been most explicitly accepted by Sir John Herschel."

**MORE ABOUT THE NERVOUS ATMOSPHERE THEORY.**—The following is an extract from the paper by Dr. Richardson to which we have once before alluded:—"The longer we think of the phenomena of muscular motion—and, indeed, of all motion in the living animal body—the less we are able to regard with favor, on the evidence before us, the hypothesis of one force in the organism, and of nerves and nervous centres as producers and conductors of that force; while we are the more inclined to extend our relations of life to the universe as a whole, and to take in every motion as belonging to our living receptive organization. But in order rightly to conceive the adaptation of the organism to the universe, the ideal of a nervous fluid, a true physical something pervading the nervous system, as the first neuro-physicists taught, is indispensable. It, and it alone, affords the connecting-link between force and matter by which force can move matter. Why cannot force—electrical, if you will—move a muscle that has actually passed into the inertia of death? Why, but that the muscle—or, rather, the nervous matter it contains—has lost some physical thing, without which it is dead to force? Why will not the dead eye see? Why, but that it has lost some physical thing with which it was wont to be charged, and through which the wave of light could extend vibration? Why, when I freeze a part of the surface of the body, will not the frozen part feel? Why, but that in the act of freezing I have condensed or have expelled from the nervous matter of the part the physical agent by which the part was connected, in arrangement and condition, with the same agent in the other portions of the nervous organism? Why, when I make an animal inhale a narcotic vapor, do I produce general insensibility?—Why, but that I distribute through the whole nervous system a foreign substance, which interferes with the natural condition for motion of the nervous matter."

**OFFICE OF PROTOPLASM IN FORMATION OF TISSUE.**—The following is from Prof. Wyville Thomson's lecture at Edinburgh University:—"It is impossible in the present state of knowledge to subject any view as to the ultimate mechanism of the formation of tissue through the means of protoplasm to direct proof. It seems now to be a very generally received opinion, supported by Huxley, Max Schultze, Hofmeister, Beale and many others, and notably by Oscar Schmidt, who would seem to bring it almost to demonstration in his beautiful researches on the sponges of the Adriatic, that protoplasm is simply converted, with a certain change of composition, into tissue or 'formed material.' There are, however, almost insuperable objections to this view. The secondary products of organization (formed material) are most various in their chemical constitutions, and it involves the admission that protoplasm may change in its chemical composition till it is almost carbonate of lime, or silica, or starch, or horn or cellulose; the last stage of the metamorphosis being its absolute separation as one of these bodies. Another view which I have always regarded as more probable is that protoplasm, the substance which is endowed with the peculiar vital property, has always the same composition, and that it acts simply by catalysis, inducing, under certain known laws, decomposition and recombination in compounds which are subjected to its influence, without itself undergoing any change, absorbing the nascent products of combination and decomposition, and recombining them and reserving them with reference to the development or maintenance of the organ to which it gives its life."

A HUMANE way of killing insects for preservation is to drop them into a jar of carbolic acid gas. This does not injure their colors in any way, but kills them quickly. The gas may be easily retained in a stoppered bottle, and is very easy to make.

## CORRESPONDENCE.

### A Trip to Colorado—1.

[Written for the Press.]

I start from Omaha. I travel on the Union Pacific through a fine country which is now being rapidly settled up, owing to the building and the management of this great railroad. This corporation owns vast tracts of land which are apparently of the most fertile character, and which it has placed in the market.

#### Through Nebraska.

Nebraska, thanks to the Union Pacific in great measure, is growing most rapidly. The soil of the plains along the road, after waiting for centuries and gathering strength by its rest, is now producing the richest returns where the husbandman is giving his labor and is calling to his aid the fertilizing power of water. This young State, admitted into the Union in 1867, had a population in 1870 of over one hundred and twenty-three thousand. Favorably situated, with an excellent climate, fine soil, and an immense area of pasture land, we see easily how it proves so attractive to the farmer. And we re-echo the song of Whittier:

We cross the prairie, as of old  
The Pilgrims crossed the sea,  
To make the West, as they the East,  
The Homestead of the Free.

The following extract may be worth publishing: "Regarding the soil of Nebraska, all farmers assure me that they can not be drowned out in wet seasons, nor yet dried up in years of drouth. This phenomenon is thus explained by a New York agricultural editor. 'The sub-soil is clay, slightly mixed with sand, having the singular quality of being porous without being spongy or clammy, absorbing the waters of excessive rains and holding them in reserve against a time of drouth, when the roots of vegetation, which easily penetrate to this depth, draw from it the needful moisture.' In accordance with this view I have observed that Nebraska mud is never lasting. The soil on the uplands is from twelve to eighteen inches thick, and along the streams fourteen to twenty feet."

#### On the Denver Pacific.

We pass through Wyoming, a territory already famous for its mineral wealth and of great promise agriculturally, as well. In 25 hours after leaving Omaha, we reach Cheyenne, the capital of Wyoming, 516 miles west of our starting point; and here we transfer our persons to the care of the Denver Pacific R. R.

This road, 106 miles long, extending from Cheyenne to Denver, was completed June 23, 1870. Its annual report shows that it earned \$304,715, at an expense of \$168,420, during 1870. It is ably managed. John Evans is President, C. W. Fisher, Supt. and Gen. Ticket and Freight Agent, and Jas. S. Potter is Road Master.

Along the line of this road are some colonies of which I shall make mention. Evans is 27 miles from Denver and Greeley about 52 miles. At Hughes, a station 18 miles from Denver, the Denver & Boulder Valley R. R. branches off to Erie, and is being continued thence to Boulder City, a place beautifully located in the foot hills and of which your paper has spoken frequently.

#### The Union Colony at Greeley.

Our train leaves Cheyenne at 2 P. M., and arrives at Denver at 7 o'clock. We have a pleasant ride, reaching, at 4:33, the flourishing town of Greeley. Here are the headquarters of the Union Colony. This is well known from its connection with the editor of the N. Y. Tribune. The people here are apparently making rapid progress and doing excellently well. All branches of industry have their representatives, and editors are found of no mean stamp, as evinced by the columns of the Greeley Tribune.

On April 25th, 1870, the census of Greeley footed up 6 souls, and on July 4th, the 1,200 citizens entertained themselves with reading the Declaration of Independence, with an oration and a ball. No better farming land is reported than that here, and for 50 miles farms join one another. Already rows of trees have been set out on all the streets, and a ditch, 12 miles long, conveys water to the city from Cache la Poudre River. Over 250 houses have been built. The projector of the enterprise and president of the colony is Mr. N. C. Meeker,

for many years agricultural editor of the N. Y. Tribune.

The payment of \$50 entitles any one to become a member and gives him 2 shares of stock and a resident lot valued at \$50. The payment of \$100 gives 4 shares and a \$100 lot. The payment of \$150 gives 7 shares and either water for 80 acres and the right to buy a 'railroad 80 acres' at contract price; or a resident lot valued at \$150.

#### Chicago-Colorado Colony.

Riding on still further we arrive at Burlington. Concerning the Chicago-Colorado Colony, here located, and the country around, I send you some extracts from the Rocky Mountain News, of May 27.

From Denver to Burlington, by the way of Valmont and Boulder City, through the valleys of Reek, Coal, South Boulder, Boulder, Left Hand, and St. Vrain creeks, there is an almost uninterrupted succession of farms and ranchos. Indeed, through these valleys there is scarcely a quarter section not improved in some way. On the unimproved portions grass is from six to eight inches high, and droves of cattle, horses and sheep are luxuriating in its length and abundance. Irrigating ditches are being improved and new ones built with wonderful rapidity, and are carrying the water, month by month, higher up the hill sides and farther over the prairies, increasing the area of agricultural lands in Boulder county, this year, by thousands of acres.

But nowhere is more visible and tangible improvement seen than within the limits of the Chicago-Colorado colony. It should be noticed that wheat is looking remarkably well; oats, ditto., and kitchen gardens as promising as can be desired. The creeks are bank full, with prospect of ample supply during the season. At the colony, the crops that have been put in, even by the most inexperienced, are looking well; out of about 35,000 trees that have been transplanted to the colony nurseries, a few score have died; the remainder are taking to the soil and climate as kindly as could be desired.

Of eight-foot wide ditches, fourteen miles have been constructed; four-foot ditto., nine miles; side and lateral ditches and channels from two feet down, twelve miles. The main ditch is now completed, and the water is running the entire length of Main street, and in several other streets, shorter distances. The excavation of the lake in the northwestern portion of the town, which is intended to cover from two to four acres, is progressing rapidly. Up to the present time the field crops and gardens have flourished finely, without artificial irrigation. In addition to the ditches already mentioned, six miles of main and lateral ditches are under contract.

There have been 315 memberships issued; there are 350 adults on the ground; many of these are single young men, others heads of families, come to get a home ready. As near as can be ascertained, 150 families are already here, either occupying their own or hired houses, or boarding until they can build.

The price of membership is the same as at the outset, \$155 each, for which the colonist receives a tract of land of forty, twenty, ten or five acres, according to location; or, if preferred, three town lots. In addition, the privilege is given to purchase one business lot 25x125, and one residence lot 85x125, at prices varying from \$25 to \$50.

#### Plattsville Colony.

Thirty-five miles from Denver is another colony at Platteville. Here they have purchased a few thousand acres of railroad land and have laid out a town. A canal for irrigating their land is to be built from the Platte River. Coal and building stone are found near the place. Most of the land purchased is west of the Platte, lying between that stream and the St. Vrain, and running down near to the junction of the two. It is level, smooth and fertile; irrigating ditches already in use, from St. Vrain and Boulder creeks, by enlargement and extension, will cover it all. These ditches will be lengthened in time for next year's planting. The intermediate government sections of land are being rapidly taken up by pre-emption and homestead, and the prospect is good for another large and productive settlement, convenient to market, and with natural resources equal to any.

W. H. M.

#### Ruhmkorff's Coil.

EDS. PRESS:—Many persons have very vague ideas of the nature of this machine—that it will destroy human life, etc., etc. Now this instrument has become such an

important means of physical research that it is desirable that its nature and *modus operandi* should be more generally known. The instrument is not a new one, however, being known as early as 1845, though it has now been vastly improved by our modern instrument-makers, and especially by one of our own countrymen, E. S. Ritchie, of Boston. This eminently scientific, and at the same time practical gentleman, has surpassed the European makers in several respects. But we must proceed.

The general principle of the machine is the production, by the electrical phenomenon known as *induction*, of secondary currents of great quantity and intensity from the primary current of a voltaic battery. There are two coils, one of coarse wire, through which after interruption at the break piece (which is made automatic in the European instruments), the primary current passes; around this coil, and carefully insulated from it, is placed a coil of very fine copper several miles in length, and the two termini of this wire form the electrodes of the instrument. The condenser due to Fizeau is an important accessory, and it seems to act on the principle of a Leyden jar. It consists essentially of alternate layers of oiled silk and tin-foil. The primary, not the secondary, current passes through it.

Such is a very general outline; and now let us see what are the effects which the machine produces. It will give a spark in free air, varying in length, and according to the size of the instrument, from 2 inches to 21 or more. A *spark*, did we say? Rather a torrent of sparks of great quantity and intensity. When a Leyden jar is interposed in the circuit, the sparks are greatly diminished in length but vastly increased in power and density; an intense white light is emitted, accompanied by a loud snapping noise, too loud to be long endured.

The grandest phenomena which are exhibited by this magnificent instrument are those of luminous electricity. The Geissler tubes of great variety of shape and form, filled with various liquids and gases, the air being exhausted, when illuminated by the passage of a current from one of these coils, present us with spectacles of the most varied and inimitable beauty.

#### ELECTRICITY.

[To be continued.]

### Battle Mountain, Nevada.

EDS. PRESS:—I send you by express a sample of ore without a name. Mr. Guido Küstel says that it is a new kind of ore. I have forgotten what it contains, but Mr. Küstel will be glad to have a piece of this specimen for analysis. [The sample is received, and we shall send Mr. Küstel a specimen. As soon as possible, we shall give the nature of the mineral.—EDS. PRESS.]

Our camp is looking up. The Little Giant is turning out ore which assays from \$250 to \$900. There has been a very rich strike made on the south side of Battle Mountain, which bids fair to be one of the best mines in the State. It is known as the Yuba, and is owned by Heintzelman, Wood and others. It shows a fine vein, assaying from \$350 to \$700.

The new mill of the Nevada Butte Co. started up this week. They have a large amount of good ore out, and will be able to run steadily on rock from their own mine. The White and Shiloh look well. The Buena Vista, Teidalph and others are being worked in earnest, and will no doubt prove good properties.

F. H.

Battle Mountain, June 25, 1871.

#### Information Wanted.

EDS. PRESS:—I should be much obliged if you, or any of your readers, would inform me if the ratio of loss of mercury is generally found to be in proportion to the quantity of silver ore worked by amalgamation, or in proportion to the silver extracted therefrom; that is, if the loss increases in the ratio of the richness of the ore, and, if so, what quantity is lost to each pound of silver extracted?

C. H. A.

Benton, Mono Co., June 25, 1871.

### The Mining Ditches at Smartsville.

The gravel mines of this section are regarded as the richest in the State, and, in fact, in the world, which idea is very naturally obtained from the success attending their operations. But this idea is to a great degree erroneous. The extent of these mines is exceedingly limited, and the yield per cubic yard is not extraordinary. Indeed, there are probably thousands of acres of gravel beds in California equally as rich, and no doubt many that would yield more. But the great secret underlying the profitability of these operations is in the bountiful supply of water at their command. The Excelsior Canal Company, that supplies nearly all the demands, is a consolidation of five companies, whose works have been projected from time to time since 1851. The company now has three ditches running from the South Yuba and Deer Creek, which furnish all the water for which they are called upon, while the Nevada Reservoir Ditch Company, having its source at Wolf Creek, brings in large volumes in the winter and spring months, most of which is used in the Blue Point and Smartsville Consolidated claims. The works now owned by the Excelsior Company cost, originally, close upon a million dollars. Of course they could be constructed cheaper now, perhaps for half the amount—yet this is the amount of capital that has been expended in the works of this company alone, and upon which a fair interest is sought. So you will perceive that the procurement of a claim, even if it be rich, is but a small consideration in undertakings of this character. Years ago, when hydraulic mining was comparatively in its primitive state, fifty cents per inch was charged, while it is now supplied in large quantities for ten. The latter price, under the circumstances, is by far the most profitable. The first cost of construction being paid, the expense of maintaining the ditches and flumes is comparatively trifling. The former seldom get out of repair, if properly attended to, while good flumes will last twelve years, with good care and occasional patching when necessary. Ditch operations have long been regarded as hazardous speculations, and to this view being entertained to a great degree by capitalists is due the poverty of many of the mining counties, which need only a bountiful supply of water to regain their former proud position of wealth and prosperity.—*Marysville Appeal*, May 26th.

LAKE SUPERIOR SILVER.—There is now sufficient evidence respecting the argentiferous deposits at Silver Island, Lake Superior, to warrant the assertion that the rich mines lately opened at that point are but a small part of the vast quantities of the precious metals underlying the whole region. The Detroit papers announce the arrival at that port of a vessel heavily freighted with silver ore taken out from a newly developed vein, sixteen miles from the Silver Island mine, from which it is inferred that the one now worked on the island is merely an out-crop of the vein, and that it continues under the lake to the shore, where it again makes its appearance. The lode from which the last specimens were taken out, has been tested to the depth of sixty feet, and gives promise of great value when developed. It is thirty feet wide, and has been traced for more than three quarters of a mile. The ore contains a sulphuret of silver, nearly pure, and a black quartz so heavy with native silver as to be immensely valuable. It is the opinion of geologists and experts that the vein extends at a varying depth below the surface for a long distance, and that its development will be largely profitable. It will require a great deal of capital to work the veins, owing to the hardness of the quartz, but with proper machinery the reduction of the ores will not be difficult.—*U. S. M. & K. R. Reg.*

OVERLAND TO THE POLE.—This is Capt. Hall's and the Arcticists' last plan,—the only sure one, when ice and currents intervene, as we know, always by sea. Like the Chinese heroes who volunteered to be hung for the satisfaction of the world, Hall will go to latitude 81°, and suffer Arctic terrors. There is this useful result always in view, that in connection with geographical determinations, new whaling and sealing grounds are likely to be discovered, which can be reached annually by swift summer steamers, to considerable individual and general profit. The idea is not theoretical, but has been pursued for years with great success by some shippers of Christianshavn in Norway, whose objective point has been the Spitzbergen country.

# MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**TARSHISH.**—*Miner*, June 24th: We have been shown a letter from a gentleman in London, in which it is stated that they have information from here—and the source of this information is easily traced to one whose opportunities are greater for judging than the Manager himself—that the Schenectady mine is opening up large bodies of ore of an average value of \$500 per ton, and that there is now in sight therein an eight years' supply for a 70-stamp mill.

**GLOBE.**—The mine is looking well. President Winchester has now permanently taken up his residence in Monitor.

### CALAVERAS COUNTY.

**WHAT CHEER.**—*Chronicle*, July 1st: Labor is being pushed on the What Cheer mine in Chili Gulch. The new machinery is kept in motion day and night.

### INYO COUNTY.

**RICH STRIKE.**—*Independent*, June 24th: The Whittekind mine, in Cerro Gordo, is producing large quantities of rich ore from a newly discovered body 30 feet from the surface, and the same distance north from the main shaft. It is reported to be equal to the best ever opened in the mine, \$3,000 worth having been extracted in the past two weeks. Work progresses on the tunnel, which taps the ledge 80 feet below.

**SPECIMEN.**—Mr. Schulte has a specimen of antimonial silver ore, from the San Lucas mine, which assays 600 ounces per ton.

### NEVADA COUNTY.

**ANOTHER STRIKE.**—*Transcript*, June 30th: We mentioned that the North Bloomville Gravel Co. were taking out in their drifts in Shaft No. 1, at Malakoff mine, \$1,000 per day, having prospects from the surface to the bed rock. They are now down to the bed rock in shaft No. 3, and have excellent prospects. The distance between the two shafts is three-quarters of a mile and the striking of the last prospect is important as demonstrating a continuous channel from one to the other.

**ALTONA COMPANY.**—*Grass Valley Union*, June 2d: The mine is on Alta Hill north-west of Grass Valley. We have noticed that the Altona had sunk a shaft to the bed rock through rich gravel. The shaft was continued down, in the bed rock, and a drift run under the gravel 320 ft. from the bottom of the shaft. At that distance the miners have "raised up" into a very rich and extensive body of gravel. Cross tunnels are being started for drifting out the pay dirt.

### PLACER COUNTY.

**DILLON MINE.**—*Herald*, July 1st: The shaft has been pumped out and is down near 60 feet, at which point the full ledge, 3 or 4 feet thick, will be shown in the bottom. This so far as worked has been very rich, all the rock having averaged by mill working over \$80 to the ton. The claim belongs to three working miners, John Dillon, Jacob Cowan and P. Hines.

**ST. PATRICK.**—This company has had a thorough survey of the mine, showing the exact relative position of the ledge at the surface and for a depth of 220 feet, by U. S. Deputy Surveyor Bethell. The shafts and levels show a vast body of rich ore exposed.

**OUR MINES.**—*Stars and Stripes*, June 29: The yield of the Yule claim, above Last Chance, for the past week, was ninety-eight ounces, worth \$1,815, for six days' work by eleven men, or within a fraction of an ounce and a half per day per man.

A two week run of the mill—4 stamps—at the Greene mine has yielded within a fraction of fifty thousand dollars, which is reckoned the heaviest yield on record.

**DUTCH FLAT.**—We are informed that the claims in operation are netting as good returns as in any previous year, and better than for several last past. Rablin, Teaff and others in the Summit claims, Plug Ugly hill, recently patented, realized fifty-five and forty-eight pounds respectively, from their two last clean-ups after two weeks' washing. This Co. owns the fee to over one hundred acres of ground supposed to be as good.

**RATTLESNAKE BAR.**—Cor. of same: We have plenty of water in the North Fork Ditch now, and it is supposed that it will run steadily, so all who wish to mine and prospect can come along.

### PLUMAS COUNTY.

**BIG TUNNEL ENTERPRISE.**—*Quincy National*, July 1st: The Keuka Co., Messrs.

Baker, Thomas and others, are running a prospecting tunnel near the head of Deadwood Creek, which empties into the Middle Fork of Feather river near Butte Bar. The Co. commenced in 1862. They are now in 1,600 feet, 1,200 of which has been through hard bed rock. They expect to strike gravel in a short time now, and will tap the channel at the depth of over 1,200 feet from the surface. The indications are that some very valuable claims will be opened.

### TUOLUMNE COUNTY.

**STILL PAYS.**—*Sonora Democrat*, July 1st: The claim bought by Burgess & Jones of Columbia continues to pay well. Week before last \$3,000 was taken out, and last week 180 ounces from 12 tons of rock. The work of only two men.

## Nevada.

### COPE DISTRICT.

**MOUNTAIN CITY.**—Cor. of *Elko Independent*, July 1st: The Independent mine continues to turn out thousands of dollars weekly. The Argenta Co. are running levels, sinking shafts, etc., preparatory to putting on a large force of miners. The Pride of the West is proving itself one of the richest mines in the camp. At the depth of 80 feet, it shows a four foot ledge of very rich ore. The Eldorado, worked by Hays, Niver & Co., shows at a depth of forty-five feet, a four foot ledge, and the ore works \$125 to \$200 per ton. The Monitor has a force at work taking out some of as rich ore as I have seen in this country.

The following is from the *Bulletin* correspondent at same place under date June 20: During the last year, the Argenta and Excelsior companies have extracted and reduced over 2,000 tons of ore, which worked \$40 to \$100 per ton, and even higher, at a cost for reduction at no time exceeding \$20 per ton. Hitherto the ores extracted have been taken out within 100 feet of the surface, but the Argenta are to commence stoping from the 400-foot level, and will soon keep all the mills in camp employed. The owners of the Independent have out 100 tons of fine ore, and recently 25 tons, reduced by dry crushing and roasting, netted \$300 per ton. This ledge is said to be nearly three feet wide. The El Dorado ledge is five feet in width, and is opened by a shaft 50 feet deep on the ledge. In sinking this, 25 tons of ore was extracted, which gave an average pulp assay of \$230 per ton.

### ELY DISTRICT.

**NEW MILL.**—H. Mathey left on Friday for a 20-stamp mill, which he purposes erecting between this place and Highland. It is to do custom work, though the main purpose is to reduce ores from the mines at Highland. We want at least half a dozen more mills. For the want of them twenty mills are idle within a mile of Pioche.

**BULLION.**—Wells, Fargo & Co. shipped, on June 22d and 24th, by way of Salt Lake, \$31,709.96.

Same of 29th says that they shipped, on June 25th and 27th, \$25,317.67.

**Hiko.**—Cor. of the same: The Crescent is proving itself a No. 1 mill. That it will run right along is certain, as there will be no lack of ore. The rich District of Timpiute and Southeastern must use the Crescent, as, also must Freiberg for a time. Work is being done on several leads at Pahranaagat, with good results. The water is insufficient to run the mill on full time.

### EUREKA DISTRICT.

**GOOD YIELD.**—*Sentinel*, June 27th: Up to yesterday, for June, the Eureka Consolidated has smelted 335 tons of bullion. The Co. is sending the bullion to New York. We are promised that for July we can report 500 tons of bullion produced by the Eureka Consolidated. The ore is in sight to make 3,000 tons of bullion.

**MINING SALES.**—The sales ending yesterday, amount to about \$300,000. Professor Clayton has been here for some time past. His report is looked upon as the test by capitalists. It is rumored that two other sales are about to be made in Secret Cañon, aggregating \$375,000. At no time since the organization of the district has there been so promising an appearance.

**PINTO S. M. CO. (LIMITED).**—Same of 28th: There will be a tunnel started at once, which will be 540 feet long, and will reach the line of the shaft 100 feet below the lowest point yet. When the purchase was made there had been work done during 18 months, and the former owners made a clear profit, beyond the cost of the mine and the price paid for labor, of \$100,000.

Same of 30th says: We learn that the company will construct a 20-stamp dry crushing mill, with roasting furnaces, to be of the best material and workmanship, and in complete working order by November 15th.

**ADAMS AND FARREN.**—Same of 29th:

The strike now made proves that there is a continuous body of ore in the incline and shaft as large as has yet been found in the district. By this discovery it has been proven that there is ore enough to run the three furnaces of the Phoenix Co. now have, for two years at least.

### HUMBOLDT.

**STAR DISTRICT.**—*Silver State*, July 1st: A gentleman from Star, who was a resident of that place when the Sheba mine was the pride of the Humboldt mountains, informs us that at no time did it ever look so well as at the present. He predicts for Star an astonishing revival within a few months. There are now four companies at work, three of them, the De Soto, Whitmore and Trinity, with a small force of men in each, and the Sheba, with about 20 men. The concentrating mill is constantly at work. The De Soto is taking out limited quantities of ore for shipment, as the company has no means of reducing it on the ground. It is reported that this mine has just changed owners, having been purchased by the English company in Reno, at a good price.

**BULLION.**—The amount shipped from the Arizona mine, through Wells, Fargo & Co., since our last issue, was \$8,058.

### REESE RIVER.

**CITIZENS' MILL.**—*Reveille*, July 1st: This evening we understand that the boilers will be fired, and the powerful engine set in motion, in order to turn the pulleys.

### WASHOE.

**OPHIR.**—*Enterprise*, June 27th: Good progress is made in sinking the new section of the shaft, though the rock in the bottom has been harder for a day or two. This hardness is not likely to prove permanent.

**SIERRA NEVADA.**—Same of 29th: The ore in the vein, 125 feet below the surface, has greatly improved. Ore enough to keep the mill running for a year is now in sight.

**KENTUCK.**—The company are taking out 50 to 60 tons of ore per day, which is being crushed by the Excelsior, Gold Hill, Quartz, and San Francisco mills.

**BULLION.**—We yesterday saw at the Bank of California \$40,000 in silver bars, from the Yellow Jacket and Crown Point mines.

**SAVAGE.**—The whole of the large body of water tapped a few days since by the Savage Co., continues to flow into the Hale & Norcross. The rush of water forced back such a quantity of slaty rock as to block up the tunnel from the Savage shaft. This is gradually being cleared out, and when the pumps of both mines can attack the water, the draining will be hastened.

**IMPERIAL.**—Same of 30th: Annual meeting has been held, and report submitted. The total amount expended on the Imperial-Empire shaft is \$430,452, and the developments have been carried to the 1,300-foot level. The results are not very satisfactory as yet, but the work is still pushed with promise.

**HOPE MINE SOLD.**—Same of 30th: James Fair and John Mackey have purchased the Hope mine in Silver City, below the Devil's Gate. It is said that their principal object was to secure the water.

**CHOLLAR-POTOSI.**—The ore breasts look as well as ever, the usual quantity of ore is being extracted and the assays run about the same as for months past.

**HALE & NORCROSS.**—Same of July 1st: The water was thought to be somewhat on the wane in the Hale & Norcross mine yesterday. It is believed that the hoisting tanks and pumps are beginning to make some impression.

**ITEMS.**—*Gold Hill News*, June 27th: Owing to the hoisting works of the Crown Point mine being fully employed, no arrangements can probably be made to work the lower depths of the Belcher through the Crown Point shaft. Arrangements perhaps might be made with the Yellow Jacket. On the 21st inst., \$24,000 was sent down from the Crown Point mine, and on the 22d, \$27,000 from the Chollar-Potosi.

**BULLION FOR JUNE.**—*Enterprise*, July 2d: The amount shipped from the office of Wells, Fargo & Co. in this city, last month, was 305 bars, weighing 27,287 pounds and worth \$741,467.40.

The water in the Hale & Norcross holds about the same. The pumps and tanks are kept constantly running and some impression is being made upon the volume of water below.

**SUTRO TUNNEL.**—The tunnel was in yesterday 2,178 feet. The rock is hard, requiring powder. There is very little water at the face of the mine.

### WHITE PINE.

**REVIEW.**—*News*, July 1st: In the North Aurora a large body of rich ore has been struck. The ore now gives a regular average, at the mill, of \$92 per ton. The

dumps of the North Aurora, Ward Beecher and Eberhardt are becoming choked up with ore—the tramway, carrying 135 tons per day, and the 60-stamp mill, pounding away regularly, not being able to keep them clear. There are now 1,100 tons piled up at the mill, Mr. Attwood intends to shut down the tramway, straighten the line, after the height of some of the posts; and when this is done, he expects to be able to transport sufficient ore to supply the International and Stanford mills. The engine and machinery for the steam hoisting works on the Ward Beecher are on the ground. The Ward Beecher Consolidated, is also under Gov. Bladell, developing into a first-class mine. The Manhattan mill is running steadily, and it is the intention to shortly start up the Dayton, on ore from this mine. A large body of high grade ore has been struck in the Featherstone, an old location. There has been no time in the history of White Pine when the mines throughout the District looked as promising as at present.

The hullion shipment for the last week amounts to \$53,794.42.

**ITEMS.**—Eberhardt ore now coming out assays \$50 per ton. Shipping 30 tons daily to mill....South Aurora has 900 tons at the mill....Ward Beecher Consolidated ships 35 tons daily of good ore....O. H. Treasure looks well, and is shipping ore to Big Smoky mill.

## Arizona.

**MINES.**—Prescott *Miner*, June 24th: The California spirit of '49 is rampant among our people. Ledges have been found to the north, east, west and south of Prescott, and are being opened with a will. Capitalists and experts from other States and Territories are here, buying and examining, and soon engines and reduction works will be heard and seen. We went to Bradshaw, we saw the metal, the water, the timber, the prospectors and miners, and are more than ever convinced that Arizona is the richest mining section of Uncle Sam's domain. Silver bricks are now quite common in Prescott, and silver ore that assays from \$100 to \$10,000 per ton, may be seen in almost every house.

**WALLAPAI DISTRICT.**—Same of June 10: A reliable correspondent writes from Mohave county: "Fifteen men are working from day till dark, constructing a large and expensive furnace. They have an excellent wagon road from some of their mines to the furnace. They have now on the dump, at the Keystone Co.'s mine, 5 to 20 tons of rock that assays nearly \$3,000 to the ton, and are only waiting for ore-sacks to ship it to San Francisco. The San Francisco Co. have a good force getting out rock of the same quality. The Mohave Co. and Nevada Co. will smelt their ores in the district as soon as the furnace is completed. The Spear, Bennet, Five Forks and other companies are developing mines. The Walkapai have constructed a dwelling-house for the miners. The company are opening up two or three promising ledges."

## Colorado.

**CARIBOU MINE.**—*Herald*, June 28th: Upon the part of the mine operated by Mr. Cutter, a small hoisting engine has lately been put in place; upon the half still in control of the original owners, a horse whim is now being put in running order. Another six months will most likely prove the Caribou to be the star mine in the territory.

**PARK COUNTY.**—Cor. of *Denver Tribune*, June 28: At Musquito District, Moyanhan & Hostetter are running four arastras on War Eagle ore, that is yielding \$70 per ton. They are only reducing second-class ore. "Uncle Tom" Cumming is at work on the Ohio lode. Smith & Co., are on a new discovery, that looks well. Mr. Musgrove has leased the Douglass mill, and intends running it on custom ores. Prof. DuBois, at Buckskin, intends having his furnace in operation by the last of July. I understand that it will have a capacity of ten tons per day, and that he intends purchasing ore. Bergh & Edmonds have leased the Bates & Burrall arastra mill and are running on ore that a few years ago was considered worthless, but is now yielding a handsome profit. Hon. J. B. Stussell, agent for a Chicago company, is building two arastras. At Montgometry the Pioneer mill is running on Paragon ore, that is yielding \$100 to \$150 per cord. Mr. Fay is running two arastras, on quartz from the Fay lode, and is taking out good pay.

**ORO CITY.**—Cor. of *Register*, 28th: Last week the Five-twenty mill was started on Printer-Boy ore. The first two cords cleaned up eighteen ozs. in fine gold, though the ore was not as good as the general

average. The Co. estimate that they have broken and in sight within the mine, nearly one hundred cords. A whim has been erected at the main shaft.

The Yankee Blade Co. at Granite, are busy with large preparations for the summer's work. The gulches are all running. The Buckeye is being worked by Hill and Henderson.

ITEMS.—Caribou Post, June 29th:—Hill & Smalley have commenced on the Potosi. At the depth of 35 feet is ore which yields an average of 150 ounces silver per ton. The "Morning Star" is a lode discovered ten days ago, 600 feet northwest from the Caribou. At the depth of three feet it assayed 119 ounces silver per ton. The owners are A. Shea, C. Smith and John Kinball. Six or seven parties are working the bed of Four-mile Creek for gold, and doing well. At Gold Hill, Fuller is working a seven-foot crevice on his White Rock lode. The best of his ore runs 14 ounces per cord, and it averages so well that he is making a net profit of \$100 per day. In Ward District, excavations are making for the chlorination works of Mr. Richardson. Carson, Long, and others are working the Nelson; Mitchell, Williams, Mooney and McDonald the Bonton; Cray, Benson and others the Columbian. The width of the Columbian lode at the surface is not determined. The gangue which fills the vast space between the walls yields, under stamps, two ounces of gold per cord. This is easily mined, and may be obtained in such quantities that if all the stamps of Colorado were put at work on it, the supply would not soon be exhausted. The iron and copper pyrites contain from three to four ozs. of gold per ton, and this gold is diffused with remarkable evenness through the ore the whole length of the vein.

ITEMS.—Same of July 1st:—Mountain Witch ore assays 230 ounces of silver per ton, and has a 7-foot crevice. The Seven-Thirty lode yields \$500 ore, like the Caribou, of which it is thought to be a westerly extension. Mr. McKenzie has a 3-foot crevice at depth of 15 feet on the Boulder County lode, filled with high grade ore. Laramee lode has a 4-foot crevice, and prospects as well as the Trojan. The Old Caribou Co. have just struck, in the east drift, the largest and richest deposit yet. Morning Star assay was \$199 per ton in silver.

### Idaho.

ITEMS.—Avalanche, June 24: Sufficient ore is being taken from the Elmore mine to keep the mill in constant operation. The Chariot continues to yield an abundance of ore from the fifth level south of the shaft. The mine will be worked to its utmost capacity this summer. Stopeing is actively going on in the Peck & Porter; the ore is taken to the War Eagle mill. Supt. Minear is making things lively on the Mahogany. The engine is ready to run. The timbering of the shaft will be completed in a day or two. Thompson & Co. are hoisting water and stoping south of their shaft. The shaft on the Mahogany, 300 feet south of Thompson & Co.'s shaft, is down 50 feet. Bob Morrison is pushing his tunnel into the hill east of the Peck & Porter, and C. S. Miller has a force sinking a shaft on the same ledge near the base of the bluff. Henderson, Townsend and others, on the Morning Star, are getting out good ore. Work is going on in the Skookum, Empire, Red Mountain, Illinois Central, Oro Fino and Udola & Talula Peak. Prospecting continues unabated on the Florida Mountain quartz claims.

Placer miners are working day and night, making the most of the water, which cannot last more than three weeks longer on the hills and in the gulches.

BULLION.—Wells, Fargo & Co. shipped this week 9 bars valued at \$13,575.62.

### Oregon.

DOING WELL.—Sentinel, June 17th: We are informed by one of the owners, that the Rogue River Mining Company are pushing their work forward rapidly, and soon expect to be able to make it pay-out. Their success will encourage others to undertake similar enterprises.

### Montana.

DRY GULCH.—New North West, June 24th: This gulch, known as "Uncle Ben's," has 15 men at work, and the first clean up was made by Gillis & Leveridge, Friday. The clean up was for a six days' run with one pipe, and the result \$850. It is coarse gold and very free from quartz, the largest piece weighing \$7.

PHILLIPSBURGH.—J. J. Lyon & Co. are crushing ores from the Speckled Trout, preparing them for shipment east for reduction. Work on the Comanche has been suspended for a time. A small 2-stamp battery with an amalgamating battery at-

tached, the handiwork of Wm. Blay and Dr. Bell, started up June 19th. The recent run of the C. S. Co.'s furnaces, by parties who had a short lease of them for experimental purposes, was a failure. The run was only 36 hours, and the product five pounds avoirdupois of silver. Smelting is now considered a failure with the Flint Creek ores, with barrel amalgamation is now the cry.

YAMHILL.—We are informed from Pilgrim Bar, that on Saturday Holcomb & Beery cleaned up \$2,000; Catching & Co., \$2,800, and D. Blair about \$2,000. The miners have water in abundance, and are making the most of it.

GERMAN GULCH.—Independent, June 23d: Earhart, Sheer & Co. cleaned up their ground since the other day, after working three weeks with five men, and took out \$1,250. The ground washed was 15 feet from the bedrock.

PIONEER CITY.—The Pioneer Co., composed of Pemberton, Stuart & Co., cleaned up last week \$5,006.50. The Enterprise Co., consisting of Doc. Young, Robert S. Kelley and J. S. Pemberton, cleaned up \$2,577.66.

GOON SALE.—Mr. Julian Abbott, of Henderson gulch, sold his mining claim to Matt Walworth for \$2,400.

CARIBOO.—We learn that the mines in the Cariboo country yielded larger returns last week than ever. There is no longer a doubt that they are the richest mines in Montana. A hundred dollars a day to the hand by picking and shoveling! O'Donnell & Co. have ground that pays above, and there is not a claim in the gulch that pays less than \$10 a day to the hand.

ARGENTA.—We learn from Mr. Stapleton that the Tootle, Leach & Co.'s smelting works are running out lead containing from \$150 to \$200 worth of silver to the ton; the lead will be shipped to Newark, N. J., for final reduction. Bohn & Co.'s furnaces are running. R. C. Hopkins is running his quartz mill at Bannack, and the mill of W. C. Hopkins is in operation. The places mines of Grasshopper creek are passing into the hands of Chinamen.

BEARTOWN.—Cor. of Helena Gazette, June 26th: At Top o' Deep, Dave Allen and Mell McGee purchased John Allen's one-third interest for \$6,000, cash. Talbot, Woodcock & Co. are making big runs at the mouth of First Chance. Yesterday they took out two nuggets—one of \$76, and the other \$16. Foley, St. Johns & Co. are doing first-rate, with ground enough to work for fifteen years. I have heard that a Chinese company has offered them \$17,000 for their ditch and diggings. Mr. James Dugan has sold his one-fourth interest in Elk creek to his partners, Drowley & Co., for \$3,000, cash down.

TEN MILE CREEK.—The different companies operating in the main creek have had a successful season so far, and most of them will be able to continue work until late in the fall, and then drift out a new supply of dirt during the winter for spring operations again.

Basin gulch, just across the range, has been very lively, and good yields have been the result; but the supply of water is about exhausted and many companies will have to close down entirely.

TO THE MINING INTEREST.—Believing that they can thereby aid the mining interest, the managers of the Eighth Industrial Exhibition of the Mechanic's Institute request contributions of ores, minerals and metals from the mines, mills and furnaces of the coast. Such contributions will be given a prominent place, and will be labeled, with details furnished of the condition, etc., of the works from which they come. The collection, if full one, will attract attention and CAPITAL TO OUR MINES. Wells, Fargo & Co. will forward, free of charge, all such packages, to be sent before August 5th, addressed to Mechanics' Institute, care J. H. OLMORE, San Francisco.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

AGENTS CAN MAKE FROM \$1,000 TO \$5,000 A YEAR in most any section of the country, selling Dana Bickford's new and improved FAMILY KNITER. This Machine is guaranteed (in its present completeness) to meet every want of the household for either domestic or fancy work. Price \$25. Send stamped envelope with full directions for an illustrated book. Address DANA BICKFORD, Vice President and General Agent, 63 Broadway, N. Y. 23v21-6m-1p

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 294 Bowers, 157 E. 26th, 477 9th Ave., New York Good work at high prices if desired. 21v1-12m-1p

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14v20

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For home use or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. Export Chocery Mills, Bruges, Belgium. 12v25-1p

## Leather Market Report.

## Our Printed Mail List.

Subscribers will notice that their names are printed on colored paper and pasted upon each copy of the Press. This is done by machinery, to expedite the issue of our paper, the regular edition of which has become too large to be convenient to send out by the old method of writing the names. The figures found on the colored paper are pasted slips representing the date to which the subscriber has paid. For instance, if the figures show that our patron has paid his subscription up to the 21st of September, 1870; 4172, that he has paid to the 4th of January, 1871; 4110, to the 4th of July, 1870. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers. If any error in the names or accounts of subscribers occurs at any time an early notice will secure their immediate correction.

## Our Agents.

## PATENTS & INVENTIONS.

### Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING JUNE 20TH.

ROLLER-SKATE.—Allen Thompson Covell, San Leandro, Cal.

DYEING AND COLORING FURS.—Adolph Müller, San Francisco, Cal.

MACHINE FOR MOLDING, PRESSING AND CUTTING SUGAR.—Peter Spreckels and James Peterson, San Francisco, Cal., assigns to Claus Spreckles and Peter Spreckels, same place.

REISSUE.

SPARK-ARRESTER.—Edw'd Wand, for himself, and Benjamin F. Dorris, assignee of Edward Wand, Eugene City, Oregon—Patent No. 99,378, dated February 1, 1870.

DESIGNS.

STEAM-PUMP.—William W. Hanson, San Francisco, Cal.

GRATE-HEARTH.—John G. Iis, San Francisco, Cal.

### Editorial Notes Eastward.—9.

To have visited Salt Lake City, and to have seen the place of which so much has been said, where the wonderful works of religious zeal have wrought the most surprising change in the face of Nature and made "the waste places glad," would have been a great pleasure to me; but the nature of my errand to the East admitted of no such delay, and I hastened on toward the rising sun.

Soon after leaving Ogden we come to one of the most noted localities on the road. We ride straight for the tall barrier of mountains, through which we find, however, the Weber river has cleared a grand way for us. As we puff slowly up a steep grade, we see wonderful cliffs and buttresses of rock, lofty walls between which the river rushes frantically at our feet. We pass into the infernal regions, according to the nomenclature of the localities, for we have dashed out of the sunny plains into the "Devil's Gate."

We climb along the steep sides of the mighty walls, and are crowded from one side of the river to the other. We pass into and out of a tunnel, and by a noted rock, called Finger or Needle Rock, of which we hear, which we do not see, but which has been preserved by the skill of the artist. Natural obstacles present themselves every moment, but mortal skill has enabled us to overcome them.

On we go, winding under, around and through the stone obstructions of Nature, the scenery continually presenting new wonders. Here we see the Devil's Slide, two ridges of granite projecting as parallel, irregular slabs of rock from 50 to 100 feet high and about 100 feet apart. How his Satanic Majesty managed to slide down those rocks, and how he enjoyed it; whether he took it as a daily pastime, or whether one trial sufficed; these and other interesting facts are left to the imagination of the visitor.

That lonely sentinel of Nature, the One Thousand Mile Tree, sees us come and go unchallenged, and marks the place for our memory. The accompanying engravings are found, with others of much interest, in Crofut's Transcontinental Guide.

April 13, 1871.

### New Publications.

SIGN WRITING AND GLASS EMBOSING; A Complete Practical Illustrated Manual of the Art. By James Collingham. To which are added numerous Alphabets. Philadelphia: Henry Carey Baird, Industrial Publisher, 406 Walnut street, 1871. 8 vo. pp 210. Price \$1.50. For sale by A. Roman & Co., S. F.

This is a most excellent work, gotten up in fine style and containing most valuable matter for the interest of which it treats. It is said to be the first work which has appeared on the subject of Sign Writing,

personally. I know nothing of your education or capabilities. Some men with the requisite skill and capital would make a fortune out of the manufacture of wooden clothes-pins. I could not. Whether you could or not is more than I know. If you had a son you designed to put into mercantile life, you would not ask, Does it pay, hut, Will my son make a successful merchant?

More and more attention has been turned to farming of late years. Many are thinking of following the example of myself and

Thus our country has to this extent lost the benefits of this industry, which is larger in the value of its product and the number of hands employed than any other single industry in the country."

A most pregnant fact is the following statement: "The combined taxes upon all the articles forming the materials of our industry yield the government a revenue of only \$3,500,000, while they impose upon the manufacturers of boots and shoes a tax of \$18,000,000—which must eventually be paid by the wearers of these necessary articles."

"The system of protective duties raises the price of house-rent, fuel, food, clothing and all supplies, so as to render extravagant wages a necessity to our workmen. This apparent increase of wages, however, yields no substantial benefit to our workmen, because it is all consumed in the greater cost of living.

"We believe that the entire removal of all protective duties would greatly advance our industry, as we should then have the market of the world in which to sell our products, thus largely increasing the labor employed and the profits of manufacturing. We, moreover, believe that the enhanced wealth and comfort of our own people, consequent upon a change of system, would be evidenced in an increased consumption of our goods."

The wool manufacture at the East seems to be another industry which is being crushed by the tariff, and other manufactures are beginning to ask to be "protected against protection."

### RELICS OF THE STONE AGE.—

There are but few of the valleys in Arizona in which may not be

and takes precedence as treating of glass embossing. Such a book as this will be found of great value to many on our coast. It is full of valuable rules and hints, and we recommend it cheerfully. Beginners will find the book the greatest help, and

### A Protest Against the Tariff.

We have received "a protest against the tariff by the shoe manufacturers of the

met with the remains of ancient art, which furnish abundant evidence that the country was once inhabited by a people who had attained a high standard of civilization.

Among the most remarkable of these relics, says the *Arizona Miner* of June 10, are those recently exhumed from a monument in the valley of Salt river, on the land owned by Mr. McKinnie. This gentleman has, for some time past, employed his leisure hours at excavating among the ruins which constitute the principal mound on his premises. At two points, after having removed the debris which covers the ruins to a depth of about two feet, he discovered a number of apartments, varying in dimensions from nine to eleven feet square, regularly built, and still containing the cement with which the walls are coated within. Besides various kinds of agricultural implements made from fragments of slate rock, he has obtained several stone hatchets and various kinds of ornaments made from different kinds of colored stones, shells and the bones and teeth of animals. It is quite probable that further research will lead to discoveries of much greater importance—as the work has thus far been confined to the extreme sides or edges of the mounds, and valuables would probably be deposited at or near the center. Mr. McKinnie intends sending a few of his most remarkable specimens to the Smithsonian Institute.

CALIFORNIA SHAD.—The Fish Commissioners of California, besides exerting themselves to protect and save valuable native breeds of fish, are laboring to introduce choice varieties from abroad. Their first experiment in this line is the deposit of 15,000 young shad, from the Hudson river, in the upper waters of the Sacramento. This river, at Tehama, where the young fish were placed, is comparatively clear, the branch streams that convey the mining discharges, entering it far to the southward. The water had been tested and found conducive to the health of the fish and full of food for their support, and there is every reason to believe that the young fish placed in it will prosper and multiply until our rivers are stocked with them. The habits of the shad are much like those of our native salmon. It descends to salt water periodically, returning to the upper channels of fresh streams to spawn.

FINGER OR NEEDLE ROCK, WEBER CANON.

THE DEVIL'S SLIDE, WEBER CANON.

even old hands will find very much of the greatest use to them.

GARDENING FOR MONEY. How IT WAS done, in Flowers, Strawberries, Vegetables By Charles Barnard. Loring, Publisher, Boston. 8 vo., pp. 345. Price \$1.50.

The author has managed to weave many valuable facts and figures into a story, which is told in an interesting manner. The picture of the farmer is held up in plain, practical colors, and the imagination is held in check by fact. The last paragraphs of the book are worthy of republication:

The question is often asked, Does farming pay? This is not a fair question. Does any business pay? Does boat-building, or soap-making, or carpentry pay? The question is not, Does farming pay, hut, Can you make it pay? This is something I cannot answer, seeing I do not know you

U. S.," and we make some extracts therefrom for the consideration of our readers.

"The legislation of other countries has aimed to secure for manufacturers and artisans the raw materials of their industry at the cheapest rates. The opposite system has generally prevailed in our country, and has retarded the naturally vigorous growth of our industries.

"The tariff tax upon our leather amounts to 35 per cent.; duties on cotton and silk rubber webbing are 35 and 50 per cent., respectively: on lastings and serges, 85 per cent. Although these highly protective duties have been levied for four years, they have succeeded in stimulating only two manufactures, who make these articles only in limited quantity and of too inferior quality to supersede the imported goods.

"The result is that the manufacture of our products has been transferred to a great degree to Canada, where it enjoys greater advantages and has fewer impediments.

## POPULAR LECTURES.

## Modern Historical Research.

[Prof. SWINTON before the MECHANIC ARTS COLLEGE Mechanics' Institute Hall, S. F. Seventh Series, Reported expressly for the PRESS.]

LECT. III. July 1.—In this, the last regular lecture of the course, Prof. Swinton gave a very interesting *resumé* of the methods and results of modern historical research. He traced rapidly the steps by which history has grown to be a science, and advance has been made from the national egotism and narrowness of the ancient Greek and Hebrew, to the broad ground of prevalence of general laws, which characterizes the modern historian. And the results of historical research, properly conducted, he claimed, were destined to influence morals, religion, and the life of society.

## Two Great Nations Discovered.

In his lecture, the Professor dwelt at length on the two great discoveries made about the beginning of this century—the disinterment of two great nations, of Egypt and of India, two or three thousand years older than the Greek. He showed how the discovery of the Rosetta stone, in 1799, during the French occupation of Egypt, gave the key-note to the whole reconstruction of Egyptian civilization, whereby the modern world learned that, 5,000 years ago, there lived in the valley of the Nile a race of a stable political organization, a high estate of civilization, with its own architecture and copious literature.

So too, the introduction among scholars of a knowledge of Sanscrit, the ancient religious speech of India, has taught of a race older by a thousand years than the oldest known monuments of the classics, and has given rise to the science of comparative philology. By this, moreover, is explained the resemblance of the classics to one another, and of the Teutonic, Slavic and Celtic languages; and it is shown how nations have migrated from Western Asia in early times—part eastwards to India, and part westwards to Europe.

While we have thus in modern times learned of the existence and history of nations thousands of years earlier than was before described in history, some geological discoveries, the finding of flint instruments in the French drift, have thrown the existence of man back over a space of time of which we have no definite measure, and which is counted not by years, but by thousands of years.

The Professor referred to the various auxiliaries to the study of history, as comparative philology, ethnology, physical geography, statistics, myths, ballads, traditions, etc.

## The Most Important Fact.

That fact which makes history a philosophy is the discovery of *progress* made continually from the earliest times. This is a modern doctrine, not to be found in Aristotle or his followers. The old idea was that order and progress are incompatible; the new idea is that they are inseparable.

The Professor gave several examples of the law of progress in language, morals, etc., but which has its most perfect illustration in science.

In conclusion, he pointed out the progress made in historical narration—how, in place of a mere pictorial relation, it has become a science showing the connection and relation of facts; how, in place of a description of a single person or nation, it treats of the whole of mankind.

## Succeeding Exercises.

At the request of very many persons, Prof. Swinton will repeat his lecture on War Correspondents next Saturday, (July 8), and on the following Saturday (July 15), the concluding exercises of the course will be held, when addresses will be made by President Durant, Rev. Horatio Stebbins and others.

A VALUABLE PAPER.—Our readers who are acquainted with the German language, will find the *Deutsch-Amer. Gewerbe u. Industrie Zeitschrift* full of interesting matter. In addition to the original articles, which are well written, it contains a summary of the various American technical journals, which gives in condensed form the most valuable items of the day in regard to mechanical and scientific progress, etc. Main office, 612 and 614 Chestnut Street, Philadelphia.

## The Philosophy of Ageing Wine.

In a late issue we made some reference to the different artificial methods of ageing wine, alluding more particularly to the process recently invented by Messrs. Neil & Constable, of this city, and promised to explain the philosophy of the same which we will now endeavor to do.

The fermentation of wine is due to the presence therein of certain living organic germs, similar to or identical with the yeast plant, and to the debris of other vegetable matter, and to gluten. The living germs—as of the yeast plant—are enopposed to live upon, and increase in quantity, by assimilating to themselves the particles of gluten. When these organisms are plentiful, the fermentation is active; as soon as they are entirely removed, fermentation ceases.

Wine undergoes its first fermentation very rapidly; but there still remains in the *new* wine a small quantity of organic matter, from which a second fermentation will eventually set in, if it is not removed. The object of all artificial means of refining is to remove these organisms. The *searing* of wine, and the harsh and unpleasant taste so peculiar to new wine, is due to the presence of these germs; the *ground taste*, as it is called, is supposed to be due to the gluten.

The second fermentation proceeds very slowly, especially when the wine is at rest, because of the insufficient access of air. The only air which can act upon wine when at rest is that which is absorbed slowly from the surface or still more slowly through the pores of the wood, and the small amount which is held in mechanical suspension in the liquid, at the time it is placed in the cask.

Wine which has been kept for a short time at the boiling point, in its packing vessel, filled full to the brim, so that the air held in mechanical suspension is all driven off, and the floating germs all killed, and the vessel then sealed up air tight, will not reach its second fermentation for a long time—generally not for years. New cider so prepared, as is well known, may be kept for a long time without change. If this work could be performed in an absolutely perfect manner, and the liquid so put up as to be absolutely air tight, no change would ever take place.

When wine is placed on shipboard and sent a voyage to sea, the air, by the constant agitation of the liquid, is admitted more freely to the fermenting germs, which consequently sooner become oxidized, and as soon thereafter as the wine is allowed to come to rest, they fall to the bottom as a pasty or flocculent kind of sediment, from which the wine may be easily drawn off, and is said to have acquired “age”—in other words it has become purified of the foreign substance left suspended in the liquid after the first fermentation. Various substances are sometimes placed in the wine to cause these impurities to settle sooner than they naturally would.

As we have already intimated, unless this aeration process is hastened by artificial means, it proceeds very slowly, occupying many years for its perfect work.

When this process is performed at a comparatively low temperature, nature is imitated perfectly, and the resulting purified wine may be depended upon as unchangeable; but the application of too high a degree of heat at the early stage of the process so changes the germ organisms, that the oxygen will not act perfectly upon them, and a second fermentation is liable to set in at some future time. The process devised by Messrs. Neil & Constable seems to meet the case more completely than any other, and if our premises are correct, its value to the wine interest of this State can scarcely be estimated. The grape grower will realize its value when he finds that by it he can produce as good a wine in three or four months from the picking of the grape, as he can by the usual process in as many years. We shall watch and report the progress of this invention, which will be put in practical application, and on a large scale during the coming month.

The process is extremely simple and inexpensive, and consists in merely agitating the liquor in a closed vessel, under two or three atmospheres, with a moderate degree of artificial heat.

## GOOD HEALTH.

## Rules of Health for Married Ladies.

Get up at 3 o'clock in the morning, clean out the stove, take up the ashes, sweep the front side walk, and scrub the front steps, nurse the baby, put the mackerel to soak, build the fires, grind the coffee, get out your husband's things to wash, see the shirt aired, boil the mackerel, settle the coffee, set the table, rouse the house, carry up some hot water for shaving to that brute of a lazy husband, and dry the morning paper. By this time you will have an appetite for breakfast. Hold the baby during the meal, as you like your breakfast cold.

After breakfast, wash the dishes, nurse the baby, dust everything, wash the windows, and dress the baby—(that pantry needs cleaning out and scrubbing)—nurse the baby, draw the baby five or six miles in the wagon for his health, nurse him when you return; put on the potatoes and the cabbage—nurse the baby—and the corned beef—don't forget to nurse the baby—and the turkeys—nurse the baby—sweep everything, take up the dinner, set the table, fill the castors, change the table-cloth—there, that baby wants nursing. Eat your dinner cold again; and nurse the baby.

After dinner wash dishes, gather up all the dirty clothes, and put them to soak; nurse the baby every half hour; receive a dozen calls, interspersed with nursing the baby; drag the baby a mile or two; hurry home; make biscuits, pick up some codfish, cut some dried beef. Catnip tea for baby's internal disarrangement; hold the baby an hour or two to quiet him; put some alcohol in the metre; baby a specimen of perpetual motion; tea ready; take yours cold, as usual.

After tea, wash up the dishes, put some fish to soak; chop some hash; send for some more sugar; (good gracious! how that sugar does go, and thirteen cents a pound!) get down the stockings and darn them—keep on nursing the baby—wait up till 12 o'clock, nursing the baby till husband comes home with a double shuffle on the front steps, a difficulty in finding the stairway, and a determination to sleep in the back yard.—Drag him up stairs to bed; then nurse the baby and go to sleep.

Women in delicate health will find that the above practice will either kill or cure them.

## Acidity of the Stomach.

Acidity of the stomach always arises from that organ not being able to digest, to work up the food eaten, to extract the nutriment which it contains, hence two results: First, the food decays, that is rots, becomes sour and generates a sour gas, which is belched up, causing a burning or raw sensation, located apparently at the bottom of the neck, or in that vicinity. Sometimes an acid liquid is generated and is belched up, and so very sour occasionally that it will take the skin off some parts of the throat, mouth or lips. Second, the food not being properly worked up, does not give out its nourishment, the system is not fed, and consequently becomes weak, the circulation becomes feeble, the feet grow habitually cold; the person is easily chilled, and dreads going out of doors; is happiest when hugging the fire, and takes cold so easily that the expression is frequently used, “the least thing in the world gives me a cold.” When such a condition is reached these colds are so frequently repeated that before one is cured another comes, and there is a perpetual cough which the most unintelligent know is the certain harbinger, the forerunner of consumption of the lungs.

When persons are troubled with indigestion, and one of its effects, acidity, the advice given in nearly all cases is to take something to correct the acidity, such as cream of tartar, soda, saleratus, ammonia, the ley of wood ashes, and other alkalies. These things correct the acidity, but the stomach gets no power of a better digestion; the effects as far as sensation is concerned are removed, but the system continues to thinuer and weaker; and with wasting of flesh being properly nourished; the man grows and strength, there is diminished power of circulation; the person becomes chilly, colds are taken from slight causes and at diminishing intervals, and before he knows it he has an annoying hacking cough, which too often ends in a wasting, fatal disease.

When acidity follows eating, it is always because there has been an error in the quality or quantity of the food eaten; the stomach could not manage it, could not perform

the work imposed upon it. The true remedy is to eat less and less at each meal, until no acidity is perceptible; or to change the quality of food; and in a short time the stomach, not being overtasked, gets time to rest, to recuperate, to get strong; then it digests more food, and digests it better, with the inevitable result of a more vigorous constitution, more power of endurance, more strength of body and greater elasticity of mind, more happiness and a spirit and energy to grapple with life's duties, which makes existence a pleasure.—*Hall's Journal of Health.*

## Philosophy of Bathing.

The following is from Dr. Mayo G. Smith, on the subject, and is worthy of consideration:

There are in the human body 2,700,000 glands and 7,000,000 pores, and but one per cent. of all perspirable matter consists of solid substances. The change in muscles, tissues and bones, occurs in from one to three years, and in the entire body in from six to seven years. If this old matter be retained, it causes disease—it is a real virus.

Some diseases are relieved almost instantly by opening the pores. Diarrhoea is frequently cured; matter from the mucous membrane is expelled through the skin; tobacco, opium and mercury have been thus exuded. Whatever through the skin the body can expel, it can absorb. Hold the end of your finger in spirits of turpentine—it is absorbed; goes through the system, and may be detected by its odor. Constant handling of arsenic has produced death by absorption.

A doctor relates an account of a gentleman in Barbadoes, who was in the habit of daily intoxication, and had constructed a tub, with a pillow to accommodate his head, and when in this state was placed therein, and the tub was filled with cold water, in which he reposed for two or three hours, and would then arise refreshed and invigorated. When his wife or family required him, they would wake him up by taking out the plug, and allow the water to escape, when he would pleasantly complain of the “loss of his bed-clothes.”

Dr. Brock, a student of Sir Ashley Cooper, once poisoned a dog, which immediately plunged into a neighboring river, and remained for some time with his body entirely submerged, after which he left his watery hospital and ran home cured. Dogs have been repeatedly cured of hydrophobia by holding them in water.

Thirst has often been relieved by immersion even in salt water, the salt probably being excluded during the process of transpiration.

At Charleston, during the epidemic, among several northern mechanics who had gone thither, but one escaped the prevailing fever, and he alone babbled frequently, and never slept at night in any of the clothes worn by day.

## Injudicious Early Rising.

One of the very worst economies of time is that filched from necessary sleep. The wholesale but blind commendation of early rising is as mischievous in practice as it is arrogant in theory. Early rising is a crime against the noblest part of our physical nature, unless it is preceded by an early retiring. Multitudes of business men in large cities count it a saving of time if they can make a journey of a hundred or two miles at night by steamboat or railway. It is a ruinous mistake. It never fails to be followed by a general want of well-feeling for several days after, if, indeed, the man does not return home actually sick, or so near it as to be unfit for a full attention to his business for a week afterward. When a man leaves home on business, it is always important that he should have his wits about him; that the mind should be fresh and vigorous, the spirit lively, buoyant and cheerful. No man can say that it is thus with him after a night on a railroad, or on the shelf of a steamboat. The first great recipe for sound, connected and refreshing sleep is physical exercise. Toil is the price of sleep. We caution parents particularly not to allow their children to be waked up in the mornings; let nature wake them up, she will not do it prematurely; but have a care that they go to bed at an early hour; let it be earlier and earlier, until it is found that they wake up of themselves in full time to dress for breakfast. Being waked up early, and allowed to engage in difficult or any studies late and just before retiring, has given many a beautiful and promising child brain fever, or determined ordinary ailments to the production of water on the brain.—*Journal of Health.*

**ASCENT OF MT. WHITNEY.**—After various trials, Mt. Whitney has at last been ascended. On June 22d, Mr. Clarence King reached the summit from the east side. This is the highest point in the United States which has ever been reached, as far as we have any definite information. The mountain is about 15,000 feet high.

**DON'T SHOOT PAPER WADS.**—The dry season is now fast approaching, and with it comes increased danger from fires, both in town and country. One of the most common causes of fires in the fields and woods, is the reprehensible habit of sportsmen in using for wadding, paper or other material easily ignited. The annual losses in this State from fires caused by the carelessness of sportsmen amounts to a very large aggregate. Gentlemen, buy patent wads or use leather, and you will, in a great measure, avert the danger complained of. The papers throughout the State will do a good service by calling attention to this matter.

**COPPER ON MT. ST. HELENA.**—The *Vallejo Chronicle*, says that, after years of exploration on the East or Lake Side of Mount St. Helena, a valuable copper vein has been discovered. The ore is, however said to be sulphate of copper. Does the *Chronicle* mean carbonate?

**THE Helena Gazette** urges the erection of redaction works at Helena, Montana. The *Gazette* generally knows what it is talking about, and its suggestion is therefore worthy the attention of the people there.

**A PAPER MILL** is talked of at Marysville to use the tule and cottonwood as raw material.

**CRESCENT CITY** has petitioned Congress for a break-water.

**EARTHQUAKE.**—Visalia experienced an earthquake shock at 12.54 P. M., on July 5.

## Ideas About Locomotives.

The iron horse is the horse of the period. From a batch of photographs lying before us, showing four different styles of Grice & Long's (Phil.) colliery and general traction locomotives, one is led rapidly to impressions touching the iron horse of the future, somewhat departing from the familiar old stack and truck, so orthodox in this country, that nothing else seems to have been deemed worthy of driving on rails for any purpose whatever.

A railroad or locomotive, we should well understand, is anything, from a quarry road, or an Alpine road, to a heavy lighting express on a level as smooth as glass, and adapted to 60 miles per hour.

Nor is speed the only criterion, for the C. P. R. R. trains on the slopes of the Sierra run 12 miles an hour, while the old Placerville stages on the westerly grade used to do the same.

The peculiar designs of Grice & Long's locomotives are meritorious for compactness, the whole machine being neatly mounted on four wheels including drivers. For local traffic, freight, grading, sand carriage, mining or quarrying or wheat transportation these locomotives appear to be well adapted.

Classing mules among locomotives, the object being in all cases to move freight, the following comparisons of working expenses made on an eastern basis in cash, are worthy the attention of freighters and merchants.

LOCOMOTIVE PULLING 15 CARS PER DAY.	
1 Engineer.....	\$3.50
1 Boy.....	1.25
Repairs, oil, fuel, &c.....	1.50
Total.....	\$6.30
MULES PER DAY.	
21 mules at \$1 per day.....	\$21.00
3 Drivers.....	6.30
Extra cost of keeping road in repair.....	2.00
Total.....	\$29.30
Leaving a balance of \$23 per day in favor of the locomotive.	
If we consider the first cost of the motors referred to, we find:	
Locomotive.....	\$3,000
50 mine wagons.....	6,250
1 siding, say.....	1,000
Total.....	\$10,250
21 mules at \$200.....	\$4,200
100 mine cars at \$125.....	12,500
3 "sidings" for passing trains.....	3,000
Total.....	\$19,700
Showing a balance of \$9,450 in favor of the engine.	

## California Silk Culture and Manufacture.

We clip the following from the *Bulletin* of the 26th inst.

Isaac N. Hoag, the Secretary of the State Agricultural Society, has just received the first order for State grown silk to be reeled into filature at the factory erected at South San Francisco. Three hundred and fifty pounds of silk in the cocoon was received from Sacramento on Saturday, and is now in process of reeling. The experiment will soon enable the California Silk Manufacturing Company to fix standard prices for the crude silk, as it shall be graded under the judgment of experience. The industry of silk growing will expand immensely and other silk manufactures will shortly spring into existence. We have been informed that the capacity of the factory at Bay View is only sufficient to manufacture between four and five hundred pounds of silk per week. This result would warrant an annual product of about 23,000 pounds of silk in the year. All converted into sewing silks, and silk trams and organdine for weavers. It is stated that a company of English gentlemen who have been waiting for the operations of this factory to get their materials therefrom, are now preparing to start their looms which they have imported from England. They intend to manufacture ribbons. In a little time all the silk textiles will be woven here.

The commendable efforts employed to bring into existence a manufactory of silk in this city, and which has now attained an almost successful accomplishment, should induce our wealthy capitalists to come forward and aid in the erection of silk weaving factories. We shall soon have among us a number of French silk artisans, drawn here from our newspaper notices of the adaptability of the climate for the growing and manufacture of silk, and also as a result of the Franco-Prussian war.

## Wagon Making in California.

Having made a comparative estimate of all the items of expense attending the manufacture of farm wagons in California and at the East, except the items of paint, coal and labor, we come now to the consideration of these.

For the information of those who have not read our former articles we will state here that on the items of iron and hard wood and the freight on the same, in the rough and in a manufactured condition, across the country, we have heretofore shown that the California manufacturer has \$16 advantage over the Eastern manufacturer on each wagon. If in the items yet to be considered that advantage is not overcome we may claim that the California mechanic instead of laboring under a disadvantage, as has been generally supposed, has really the advantage of his Eastern competitors.

First as to paint. We can only figure on the paint used on the running gear as the boxes of imported wagons are, as heretofore stated, built and painted here. The paint on the running gear of most farm wagons consists of English venetian red and oil, and a very little lamp black for sticking. The venetian red is imported from England to New York and to San Francisco at equal cost, the freight being the same to each place. The freight from New York to Chicago is \$15 per ton, and from San Francisco to Sacramento it is \$2.50 per ton. So that upon this item the mechanics of Sacramento and other interior California towns have the advantage of the mechanics of Chicago or South Bend. If any white lead is used in the paint, our mechanics can get that as cheap as they can get it at Chicago or South Bend. The Atlantic lead being manufactured in the vicinity of New York can be laid down in San Francisco at \$10 per ton freight, while it costs \$15 to lay it down in Chicago. Our linseed oil is grown and manufactured in our own State, but the price is regulated by the ruling price of the imported article. On this article our Eastern competitors probably have a very little advantage over us. However, the amount of paint used on each wagon is so little that a slight variation in the cost of the articles composing it, makes but a very small figure in the costs of the wagon; but whatever that figure may be we have shown it to be favorable to the California manufacturer. Two pounds of venetian red mixed with one pint of oil will paint the running gear of a single wagon. This mixture, in Sacramento, can be obtained of paint and oil dealers for eight cents per pound. So that it will be seen that the cost of the material in the painting of wagons is very slight. The labor is the principle item of the expense of painting a wagon. The expense of labor we consider under the head of labor.

## Coal.

We are informed by practical mechanics that it requires, on an average, just about one ton of coal to keep up the fires for ironing off six thimble-skein farm wagons. Good Cumberland coal is worth in New York, on an average, say \$10 per ton. The freight to San Francisco is \$10 per ton—making it cost the importers here, in bulk, a little over \$20 per ton. The cost to manufacturers here is, on an average, about \$24 per ton. The item of expense then for this article for six wagons, manufactured in California, may be put down at \$24, or \$4 for each wagon.

We are not positively informed as to the exact cost of the same article of coal in Chicago or South Bend, but will estimate it at a very low figure, so as to make no mistake in our favor, say \$6 per ton. This estimate will make the item of expense to the Eastern manufacturer for coal, on each wagon, only \$1, against \$4 to the California manufacturer—a difference of \$4 against

us. Deduct this from \$16, which stands in our favor as above stated, and we still have \$13 on each wagon in favor of the California manufacturer; or, in other words, he has \$13 margin over his Eastern competitors on each wagon.

## Cheap Coal.

Some of our mechanics have of late been experimenting with Australian coal, and find that though it is not equal to the best quality of Cumberland coal, still a good quality of the former is superior to a poor quality of the latter.

To persons accustomed to the use of the Cumberland coal it requires some considerable persevering experiments to learn how to use the Australian, but when its peculiarities are once learned, mechanics of great experience and ability assure us that it is very little inferior in quality, and, considering the price much more economical. The Australian coal can be laid down in San Francisco at \$10 per ton, and can consequently be afforded to our manufacturers at about one-half the cost of the Cumberland or Eastern coal. Coal mines are constantly being discovered and opened on the Pacific Coast, and we feel certain that within a very few years coal of the best quality will be afforded here as cheap as in any of the Atlantic manufacturing centers. This being the only item now in the way of equal facilities to our manufacturers, we think they should entertain no fears of final success in the competition for the trade of the Pacific which is now going on between them and their brethren east of the Rocky Mountains.

## Labor.

One of the greatest drawbacks to the manufacturing industries of the Pacific Coast, and especially of California, has heretofore been the high price demanded for labor. The time was when a man with pick, shovel and rocker could go into the mines, and by industry dig out from \$8 to \$16 a day, and average this the year round. Under such a state of things the manufactures could not of course be prosperous here, and importation was then all the rule. Repairing had to be done here, and for this work mechanics commanded prices in proportion to the value of labor devoted to mining pursuits. All this is now changed, and although it has been a hard and disagreeable road to travel, labor has been compelled to go down hill until now it is glad to find employment on terms as low as it commands at many places in the Eastern States. This is a great change from former flush times in California; but the sooner this change is looked square in the face and acknowledged and acted on as a matter of fact, the better it will be for all parties concerned, for the employed as well as the employer. The products of labor are worth no more here to-day than in Illinois or New York. The cost of living is no more, if as much. Then why should labor demand a higher price? Such demand results only to its disadvantage and to the disadvantage of the whole country.

We have before us a copy of the *New York Herald*, of March 19th, 1871, in which is given a list of prices paid for all kinds of labor in that city and vicinity, as reported by the free labor bureau of New York City. We quote the prices paid some of the mechanics, and ask a comparison with those paid to similar employments in this State.

Blacksmiths, per day.....	\$2.50 to \$3.00
Boiler makers ".....	4.00
Carpenters ".....	3.50
Cabinet makers ".....	3.50
Coopers ".....	3.00
Coch makers ".....	3.00 to 5.00
Engineers, per month.....	50.00 to 100.00
Mechanists, per day.....	3.00 to 5.00
Painters ".....	3.50 to 5.00
Wood carvers ".....	5.00
Wheelwrights ".....	2.50

The above is sufficient to show that the prices paid for mechanical labor in New York are fully as high, and if any difference, a little higher than are paid for the same kinds of labor in California.

We have now compared all the items of expense actually and directly involved in the manufacture of wagons in California and the Western States of the Atlantic slope, and find a margin still in favor of the California manufacturer to the extent of \$13 on each farm wagon. With these facts in our favor we are yet confronted with the stubborn and damaging fact that one half of the farm wagons sold in the State within the past year have been imported from the East. In our next on this subject we will endeavor to show where the trouble lies.

## Academy of Sciences.

## Minerals and Fossils.

The regular meeting was held last Monday. Mr. Hanks presented, from Mr. W. B. English, a specimen of potash alum from Silver Peak, Nevada, where it is said to exist in abundance in an old lake bed.

Dr. Blake presented a number of mineral specimens from near Humboldt River, Nevada, with fossil bones and casts. Concerning *amphibole* specimens given, Mr. Durand read a description. They occur as hexagonal prisms of two different systems of formation; are green and opaque, but fuse readily to a colorless glass; their granular appearance is not common, but resembles a variety of *peridot* described in Dana's Manual, p. 257.

## Undetermined Specimens—Indian Relics.

A letter was received from Mr. Dietz, of Victoria, V. I., relating to the supposed central stems of *Virgularia*, presented June 5th, and stating that they were fished up on the cod banks of Burrard Inlet, B. C. He offered to send more if wanted, and the Secretary was instructed to write for perfect ones in alcohol.

Dr. Bennet presented a mortar and a pestle of Indian make.

A plan submitted with regard to the meeting of the American Association for the Advancement of Science was referred to the Board of Trustees.

## Coast Terraces—Fossil Ship.

Prof. Davidson spoke of his measurements of the coast terraces from here to San Diego. He had found four principal elevations, from 20 to 150 feet high, running as far back as 6 miles from the present beach. They are highest at San Pedro, declining thence rapidly southward to San Diego, but slowly northwards to San Francisco. The curious mounds like those seen near Puget Sound were found well developed in spots along the whole coast.

Mr. Hanks stated that the object on the Colorado Desert, supposed to be a ship, does not prove to be such. Its resemblance to a vessel from a distance is, however, generally acknowledged.

## Obituary.

The following resolutions were adopted. "Resolved, That in the death of Gregory Yale, Esq., this Academy has lost an active, zealous and worthy member, one always ready to contribute his labor and his means to advance its purposes, and one whose amiable disposition and goodness of heart endeared him to his associates.

"Resolved, That these resolutions be engrossed on the minutes and a copy forwarded to the family of the deceased."

The Academy then adjourned.

## THE SULPHUR WORKS AT CLEAR LAKE.—

The Sulphur Works at Clear Lake, says the *Lower Lake Bulletin*, are now being worked to their full capacity. Hundreds of boxes filled with the refined article await transportation to Calistoga. All the teams that can be spared about here are diligently engaged in executing contracts for hauling. The demand for sulphur seems to be increasing. A curious cavern has been recently discovered in the sulphur hank, where subterranean roarings are heard and whence issue fumes that prevent one from entering. A horax spring has also been recently discovered in this vicinity that promises fair for further development.

**MINERS' CONVENTION.**—The Mining Bureau has called a convention of miners and persons interested in mining to assemble in Sacramento, in the Senate Chamber of the new Capitol, at noon on the 31st inst. Each county in California, Oregon, Nevada, Utah, Arizona, and Idaho is to be entitled to one delegate to be elected at the county seat on the 23d inst.

**VOLCANIC ERUPTION IN PLUMAS.**—The *Butte Record*, of June 24th says:—A. F. Blood, just returned from Plumas, reports the breaking out of volcanic eruption in Black Mountain, contiguous to Lassen Buttes. It is said to be vomiting, to the height of thirty feet, large quantities of lava, and emitting a bright flame visible to all the surrounding country.

## Carbon Tool Points.

The PRESS has from time to time spoken of the ever extending use of the diamond in the mechanic arts, and of the great intrinsic value of the imperfectly crystallized forms, called by some carbon diamonds, for various purposes. We have also spoken of the firm now represented by Mr. John Dickinson, of New York, which is said to be the oldest of its kind in existence, having been established in Europe in the last century, and since its foundation having been engaged in the manufacture of glaziers' diamonds and in cutting and working diamonds for all mechanical purposes.

On account of the irregularity of shape

DICKINSON'S CARBON POINTS.

of the carbons and the trouble of obtaining exact cutting edges and of setting them securely, Mr. Dickinson has made certain improvements in their preparation for stone dressers and cutters, and for drilling, reaming, sawing, planing, carving, engraving and dressing various stones, metals, glass, china, etc., etc.

The advantages of these carbon points over the natural crystals or steel are claimed to be numerous, the most important

Fig. A.

NORTON'S DOOR SPRING.

being that, as they are more durable and do not require sharpening, by their being artificially formed into wedge, angular or other shapes, fewer of them are required; also they can be firmly and solidly adjusted in dovetailed seats or grooves in a holder with the greatest ease. The engraving represents some of the various forms to which the diamonds are ground for different mechanical purposes. These need not be specially enumerated here. Suffice it to say that their efficiency, economy and rapidity of execution are vouched for on good authority. The illustrated points range in size from one-sixteenth of a carat to ten carats each, a carat being equal to four grains. Their perfectness of finish depends upon the purpose and material to which they are to be applied. For metal they require to be sharper than for stone. The prices are fixed in accordance with their shape and finish. For his important improvements in the preparation of the points, patents have been granted to Mr. John Dickinson, 64 Nassau street, New York City, to whom apply for further information.

## A New Door and Gate Spring.

In our issue two weeks ago we made brief mention of a new door and gate spring, recently invented in the East, and now being introduced here by Mr. Geo. B. Davis, of Alameda, promising at an early day to give a fuller and an illustrated description of the same. This promise is now fulfilled, and the mode of constructing and operating the spring may be readily learned by examining the annexed engravings.

The object of this invention is to provide a more serviceable and reliable spring than has heretofore been presented for the purposes named. Of the many devices of

the kind hitherto in use there are none to which grave objections may not be made. One overloads the door with iron, presenting an unsightly appearance, another crowds the door too hard when open, and loses its force before it is closed, while others disturb us with creaking or rattling noises, etc., etc. The inventor of the spring herewith presented, claims to have essentially obviated all these objections, and to have brought out a device which,

Fig. B.

NORTON'S GATE SPRING.

for neatness and durability, cannot fail to commend itself to the public. It has a force nearly equal at all points, and while it allows the door to swing back against the wall, it will close it from any point, tightly, quietly and surely.

This spring may be seen in operation at the office of the agent, G. W. Blake, 305 Montgomery street. It may be made ornamental as well as useful, and may be plated or painted to suit the taste of the individual.

We understand that it has been submitted to most of the leading architects of this city who are almost or quite unanimous in their expressions of approval of it.

Fig. A. gives a general idea of the construction of the spring and the mode of its application to a door. The spring consists of a coil of spring-brass wire, working loosely upon a metal standard and secured to the door casing by screws. One end of the spring, which will be seen projecting from the upper right hand side of the coil,

rests firmly against the casing, while the opposite or lever end is hooked to an adjustable spring, secured to the door. Its working will be readily understood without further explanation.

Fig. B. represents the gate spring as applied to a gate. This is the same as the door spring, only double, being made with matched pairs of springs, right and left, and placed upon a double support, secured to the gate post, as shown. The lever arms rest on a swinging brace attached to the gate. These double springs are also adapted to heavy doors.

Mr. Davis owns the rights for all the States and Territories on the Pacific Coast. In anticipation of a large demand for the article, as is the case at the East, Mr. D. is making arrangements to have them manufactured in this city, and under his own especial supervision.

## The Remfrey Separator.

A machine called by the above name, and designed to separate, classify, and concentrate ores, minerals, or metals from their gangue, or from each other, according to their specific gravity, has recently been invented in Germany, and has attained great popularity among miners who have become acquainted with it. Large numbers of these machines are now in use in the Welsh, Spanish, and Sardinian mines, and several of them are now in operation at Tarnagulla, near Bendigo, in Victoria, where they are found to answer admirably for separating auriferous pyrites from crushed quartz, either during the process of stamping, or by dealing with the tailings. The Remfrey Separator is certainly effective in its action, simple in its construction, not liable to expensive wear and tear, and requires little attendance. In shape the machine is semi-cylindrical. It is made of plate-iron, about 6½ feet long, 3½ feet wide, and 3½ feet in height; divided into as many compartments as there are ores or minerals to separate, advantage being taken of the difference in their specific gravities, the heaviest being deposited in the first, and the lightest in the last compartment. The weight of the machine is 15 cwt., and it may be set upon wheels, or easily removed on an ordinary dray. It is well known that miners almost invariably wash away all the tailings from the batteries, although they are aware that in many instances the tailings contain a large amount of gold, both free and in the pyrites. Should, however, this machine prove to be what it is stated to be, miners will now be able to concentrate the auriferous pyrites during the reduction of the quartz; indeed, Mr. Pritchard, who has had large experience in quartz mining in Victoria, states that wherever auriferous pyrites abound in the stone, the machine should be fixed direct to the batteries (one machine to every six stamps), and that the use of the mercury and blankets should be dispensed with. In Britain this separator is chiefly used for separating the ores of lead and zinc. The stuff from the batteries flows over five sieves, through which the finer particles of gold fall into a receptacle beneath. In a compartment parallel to this, and extending the whole length of the machine, plungers are placed, which, making alternate strokes, give a pulsating movement to the water which flows over the sieves. This pulsation aids in drawing the heavier ores to the bottom, and the result is that not a particle of gold escapes.—*Sydney Mail*.

**FIRE.**—A disastrous fire, on July 4th, destroyed a third of the town of Yreka, and occasioned a loss, as reported, of \$300,000. This is a sad blow to the place. \* \* \* On the morning of the 5th, the smelting works of C. H. Swain & Co., at Truckee, were burned to the ground. \* \* Dunn & McCone's mill, at White Pine, was burned on the 4th.

**WATERSPOUT.**—On the 4th, a waterspout burst in the mountains, 14 miles west of Reno, washing away the track of the Central Pacific Railroad. The next train was thrown off the track at the place.

**THE STRIKE.**—The last reports, previous to our going to press, denote a disposition to compromise matters at Sutter Creek. We sincerely hope that the strike may soon come to an end. It is now causing a great loss, if not want, to the workmen.

## DOMESTIC ECONOMY.

We gather the following items on domestic economy from one of Kate Hunnicbee's late contributions to the *Hearth and Home*:

Some one asks how, with a baby a month old, a mother can find time to attend to flower beds, or other out-door matters. She is answered as follows:

"Have a little carriage, put a pillow in it, wrap up the baby warm, and while you work at the flowers, the little one will be breathing pure air—a hard thing to find in many dwellings. It is very easy to accustom children to passing many hours every day in the open air, and they are far less subject to colds, coughs, and other complaints, if they spend a part of every pleasant day under the blue sky. A carriage is as indispensable as a crib. If it is only a box with two wheels and some sort of a shade arranged over it, to keep the light out of baby's eyes, it may save a big doctor's bill."

### Breakfast Bill of Fare on the Farm.

The following is given as a list of breakfast dishes, which may come upon the table in the spring—to be varied some one morning, some another: Warm rolls, toast, fried mush, hominy, eggs boiled, scrambled, shirred or poached; fish, in its season, broiled or fried, cold corned-beef and ham, hash, beefsteak broiled, veal and lamb cutlets, rice cakes or flannel cakes, waffles and muffins. We farmers make great account of our pork barrel in spring, and of our hams. I often have fried pork for breakfast, and by way of variety, dip each slice into a batter of eggs, beaten up with flour, and then fry them. This makes an appetizing and nutritious dish, very good for workmen to plow on.

### How to Cook Salt Mackerel.

We use salt mackerel at breakfast, too; for the fish wagon seldom passes our door, and we are two or three miles from market. I am always careful, in removing it from the brine, not to let it touch the oil floating on the surface of the salt water, to wash it clean, and then soak it, with the flesh side down, eight or ten hours. Then I wash it, and soak it over night in sweet milk, and dry it by the fire. It is next broiled five minutes, flesh side down, over lively coals, turned so as not to break the skin, and left over the fire ten or fifteen minutes until done. Thus cooked, it can be eaten with zest by almost any one. Cod-fish, too, comes frequently on our table by way of variety. This is soaked over night in water to freshen it, then spread fine into sweet milk, scalded and thickened with flour or eggs.

### Tomato Toast

Is a favorite breakfast dish with my family. A pint of canned tomatoes, the same of sweet milk, plenty of butter, the whole brought to a boil and thickened a little with flour, then poured over bread nicely toasted—my boys and girls think there is nothing better.

### Fruit, Etc., for Breakfast.

Fruit of some kind is very desirable on the breakfast table, more so, I think, than at either dinner or supper. Everybody ought to indulge, at the morning meal, in cantelopes and muskmelons in their season, if they have to raise them in a barrel of rich earth in the back yard.

There is one dish farmers might enjoy every morning, and that is cream cheese. Let the whey be drained from lobbered milk through a colander, and the curd served with sweet cream and white sugar. There is nothing more delicious of a warm spring or summer morning than this.

### Dinner and Supper.

It is always easy to get up dinner and supper for a private family. For the latter good bread and butter, a plate of cold meat or dried beef, a little cheese, a bit of cake, a cup of tea or chocolate, is enough for ordinary occasions.

**TABLE CLOTHS FOR CHILDREN.**—A very neat and serviceable table cloth to spread under children's plates may be made by simply giving a piece of coarse muslin two coats of white paint. The first coating should be thoroughly dried before the second is applied.

**SWEEPING CARPETS.**—Persons who are accustomed to use tea-leaves for sweeping carpets, and find that they leave stains, will do well to employ fresh-cut grass instead. It is better than tea-leaves for preventing dust, and gives the carpet a very bright fresh look.

## Apples as Food.

We have several times referred to the excellence of apples as food, either raw or baked. There is no kind of fruit that enters into the various combinations of cooking which is superior to the apple. For pies, especially, there is nothing better, cheaper, or more healthy. Care, however, must be taken in making them, if you would have them really good and palatable. A very excellent cook book gives the following receipt, than which we have never seen a better:—

Peel and cut about two pounds of apples, tart ones being the best for that purpose; cut each into four pieces, removing the cores; then cut each quarter into two or three pieces, according to the size. Put half of them into a pie-dish, slightly press them down; put over them two ounces of brown sugar; put in the remaining apples; then add another two ounces of sugar, making the apples form a kind of dome, the center being two inches higher than the sides; add a small wine-glass of water; cover the top with paste, and bake in a moderate oven, from half to three-quarters of an hour.

And here is a receipt for making what may be called an apple cake:—Mix unholted wheat or rye-meal with cold water, making a dough or batter soft enough to nearly level itself. If shortening is desired, use sweet cream or butter. Fill a rather deep pie-plate about a third full of the batter, and sprinkle over a little sugar. Wash, quarter and core tart apples, and place as many in the batter (skin side up) as it will hold. They may be pressed down and leveled with a stiff spoon. Over the top sprinkle some sugar, and bake till nicely brown. This cake is both wholesome, nutritious and delicious. Children and grown folks can eat of it without danger of injury.

## Preserving Figs.

Now is the season for preserving this excellent and healthful fruit. The following directions are given for preserving them in sugar:—Take the fruit when not quite ripe. Soak for ten or fifteen minutes in weak, warm soda water to remove the skin; or peel thinly with a sharp pen knife. To one pound of figs use three-quarters of a pound of sugar. When the syrup is made, put in the fruit, and let it boil until half done; take them up and spread on a dish, and put in the sun. Let the syrup simmer slowly, always carefully removing any impurities that may rise to the surface. When clear, put in the figs; let them cook until transparent, taking them out separately when done. Set in the sun again; if the syrup is not clear, skim again; do not let it boil away too much. Put the figs in jars, and when the syrup is cold, pour it over them. Very small and thin-skinned figs, like the "Celestial," are better if put up without being skinned.

Will some of our readers who have had experience in drying figs furnish us with the manner in which they succeed best in so preparing them; also the variety of fig experimented with. We occasionally meet with California figs equal to any ever imported, but many are quite inferior. We would like to give a reliable method for the benefit of the public. We trust that some one who has made this business a success will be public spirited enough to communicate his experience for the benefit of others. California might and should furnish the entire Union with figs and raisins.

## Canned Meats.

Canned meats are coming into extensive use in New York and elsewhere at the East. A correspondent of the *Hearth and Home* says: "We have used several dozen cans of Texas beef in our family since last summer, and very much prefer it to the tough, flavorless, stringy steaks that are often all one can procure in our Busydale market. It costs only about half as much as that we get of the butcher, and is, on an average, fully twice as good. If day laborers, who must have a meat diet, could only be made acquainted with its value as food, they would buy it freely, and so get the worth of their money. For those whose teeth are imperfect, and for children who cannot be made to chew their food thoroughly, this meat cannot be too highly recommended.

## Domestic Receipts.

**TO 'CRYSTALLIZE' FLOWERS.**—Construct some baskets of fancy form with pliable copper wire, and wrap them, with gauze. Into these tie to the bottom violets, ferns, geranium leaves—in fact, any flowers except full blown roses—and sink them in a solution of alum, of one pound to a gallon of water. After the solution has cooled, the colors will then be preserved in their original beauty, and the crystallized alum will hold faster than when from a hot solution. When you have a light covering of crystals that covers completely the articles, remove the basket carefully, and allow to drip for twelve hours. These baskets make a beautiful parlor ornament, and for a long time preserve the freshness of the flowers.

**TO REMOVE STAINS FROM A BOOK.**—To remove ink stains from a book, first wash the paper with warm water, using a camel's hair brush for the purpose. By this means ink is got rid of; the paper must now be wet with a solution of oxalate of potash, or, better oxalic acid, in the proportion of one ounce to half a pint of water. The ink stains will immediately disappear. Finally, again wash the stained place with clean water, and dry it with white blotting paper.

**TO MAKE A GOOD MUCILAGE.**—The best quality of mucilage in the market is made by dissolving clear glue in equal volumes of water and strong vinegar, and adding one-fourth of an equal volume of alcohol, and a small quantity of a solution of alum in water. The action of the vinegar is due to the acetic acid which it contains. This prevents the glue from gelatinizing by cooling; but the same result may be accomplished by adding a small quantity of nitric acid. Some of the preparations offered for sale are merely boiled starch, or flour, mixed with nitric acid to prevent the gelatinizing.

**TO CLEANSE WOOL.**—Make a brine, take a pint of salt to a full pail of water or thereabout, heat it hotter than the hand can be held in it, but not to boiling; put in the wool, set it off from the fire, let it stand from ten to thirty minutes, as convenient; take it out to drain, as it will be too hot to wring, then wring it, saving the brine, as a painful may be used to cleanse fifteen pounds by heating over. Rinse in two or three waters; warm water is best.—Try this, and if you are not pleased with it I am mistaken, for many of my neighbors come to me to know how I cleanse my wool to have it so white.

## Mechanical Hints.

**AN APPROVED WHITEWASH.**—The following is sent out by the Lighthouse Board of the Treasury Department: "The following recipe for whitewashing has been found, by experience, to answer on wood, brick and stone, nearly as well as oil paint, and is much cheaper. Slake half a bushel of unslaked lime in boiling water, keeping it covered during the process. Strain it and add a peck of salt, dissolved in warm water; three pounds of ground rice put in boiling water, and boiled to a thin paste; half a pound of powdered Spanish whiting, and a pound of clear glue, dissolved in warm water; mix these well together, and let the mixture stand for several days. Keep the wash thus prepared in a kettle or portable furnace, and when used put it on as hot as possible, with painters' or whitewash brushes."

**DURABLE AND CHEAP WROUGHT NAILS.** We presume every farmer understands the usual method of making cut nails flexible by heating them; but if, instead of allowing them to cool in the open air, they are thrown when red hot into linseed oil, it will prevent their rusting almost as long as though they were galvanized. Those who have occasion to use cut nails instead of wrought, should not forget this simple method of preventing rust.

**POISONOUS PAINTED PAILS.**—The practice of painting the inside of wooden pails, to prevent leakage, is only to be recommended when the paint contains no white lead or baryta, both of which we found in the paint of some pails examined lately. All over the country these pails are used in the kitchen, and although neither lead nor baryta are very soluble in water, yet frequently the paint peels off in flakes, and may have serious consequences when getting into the tea-kettle, and thus into the food. Baryta is, however, much less injurious than lead. The paint for such purposes should be either whiting or gypsum, if required white; but most preferable is ochre, against which the sanitary objection cannot be raised. — *Manufacture and Builder.*

## LIFE THOUGHTS.

HE who sows brambles must look well to his shoes.

THE way to Babylon will never bring you to Jerusalem.

TO argue with an angry man is like preaching to the sea.

A horse is neither better nor worse for his trappings.

HE who wastes time throws away that he can never replace.

IT was well said by a Roman emperor that he wished to put an end to all his enemies by converting them into friends.

SHOULD misfortune overtake you, retrench, work harder, but never fly; confront difficulties with unflinching perseverance.

SEVEN years of silent inquiry are needful for a man to learn the truth, but fourteen in order to learn how to make it known to his fellow men.—*Plato.*

LIFE is too much for most. So much of age, so little of youth; living for the most part in the moment, and dating existence by the memory of its burdens.—*Alcott.*

RELIGION, if it be true, is central truth, and all knowledge which is not gathered round it, and quickened and illuminated by it, is hardly worth the name.—*Channing.*

## The World's Work.

Our external lives are not made up of great occasions, and our greatness is not in superhuman and exhaustive efforts, but in gradual growth, and this is nourished by little daily acts and sacrifices and efforts which call into exercise every faculty of soul and sense; and the lives which most deserve to be called sublime are those of which the world and history and poetry take little account. The lives of men and women around us are, for the most part, common-place, and we could not afford to have it otherwise. If all of them were reaching after occasions of rendering themselves sublime, how would the world's work be done? The world's work is tiresome, perplexing, uncongenial, and sometimes, and for some people, of necessity, it is very disagreeable and menial service, yet in the spirit in which this work may be conceived and carried forward to the end, there is a sublime purpose and consecration, he the end never so humble.

## Stand Like an Anvil.

BY BISHOP DOANE.

"Stand like an anvil!" while the stroke  
Of stalwart man falls fierce and fast;  
Storms but more deeply root the oak  
Whose brawny arms embrace the blast.

"Stand like an anvil!" when the sparks  
Fly far and wide a fiery shower;  
Virtue and truth must still be marks,  
Where malice proves its want of power.

"Stand like an anvil!" when the bar  
Lies red and glowing on its breast;  
Duty shall be life's leading star,  
And conscious innocence its rest.

"Stand like an anvil!" noise and heat  
Are born of earth and die with time;  
The soul, like God, its source and seat,  
Is solemn, still, serene, sublime.

**MAKE OTHERS HAPPY.**—Some men move through life as a band of music move down the street, flinging out pleasure on every side through the air to every one, far and near, who can listen. Some men fill the air with their presence and sweetness, as orchards, in October days, fill the air with the perfume of ripe fruit. Some women cling to their own houses like the honeysuckle over the door, yet like it fill all the region with the subtle fragrance of their goodness. How great a bounty and a blessing it is to hold the royal gifts of the soul that they shall be music to some, and fragrance to others, and life to all! It would be no unworthy thing to live for, to make the power which we have within us the breath of other men's joy; to fill the atmosphere which they must stand in with a brightness which they cannot create for themselves.

**THE GRAVE.**—It buries every error, covers every defect, extinguishes every resentment. From its peaceful bosom spring none but fond regrets and tender recollections. Who can look down upon the grave of an enemy and not feel a compunctive thro that he should have warred with the poor handful of dust that lies moulding before him?

ducts, etc., which they have either constructed or are  
prepared to construct. A copy will be mailed on appli-  
cation to our address, No. 410 Walnut Street, Phila-  
delphia. ap8-ly

The "PAIN KILLER" may justly be styled the great medi-  
cine of the world, for there is no region of the globe into  
which it has not found its way, and been largely used and  
highly prized. Moreover, there is no climate to which it has  
not proved to be well adapted for the cure of a considerable  
variety of diseases; it is a speedy and safe remedy for burns,  
scalds, cuts, bruises, wounds and various other injuries, as  
well as for dysentery, diarrhea, and bowel complaints gen-  
erally. It is admirably suited for every race of men on the  
face of the globe.

It is a very significant fact, that notwithstanding the long  
period of years that the "Pain Killer" has been before the  
world, it has never lost one whit of its popularity, but on the  
contrary, the call for it has steadily increased from its first  
discovery, and at no previous time has the demand for it  
been so great, or the quantity made been so large, as it is  
to-day.

Another significant fact is, that nowhere has the Pain  
Killer ever been in higher repute, or been more generally  
used by families and individuals, than it has been here at  
home, where it was first discovered and introduced. That  
the Pain Killer will continue to be, what we have styled it,  
THE GREAT MEDICINE OF THE WORLD, there cannot be the  
shadow of a doubt.—Providence Advertiser.

## Miscellaneous.

Of a far Higher Class than any other proprietary  
medicine of the day stands

Tarrant's Effervescent Seltzer Aperient,

And for this reason: it is an exact counterpart of one of  
the most valuable medicines in the world. We refer to  
the great Seltzer Spring of Germany, to which thousands  
of the dyspeptic, the bilious, the rheumatic, and the  
victims of vernal disease resort annually, and return to  
their homes convalescent or cured. The Aperient is  
one of the first, and by far the most successful, of all  
the efforts made to reproduce, in a portable form, the  
popular mineral waters of Europe. SEE THAT YOU  
PURCHASE ONLY THE GENUINE ARTICLE.

SOLD BY ALL DRUGGISTS.

7-30 GOLD LOAN

OF THE

## Northern Pacific Railroad.

RAPID PROGRESS OF THE WORK.

The building of the Northern Pacific Railroad (begun  
July last) is being pushed forward with great energy  
from both extremities of the line. Several thousand  
men are employed in Minnesota and on the Pacific  
coast. The grade is nearly completed 466 miles west-  
ward from Lake Superior; trains are running over 100  
miles of finished road, and track-laying is progressing at  
the rate of one to two miles per day. Including its pur-  
chase of the St. Paul & Pacific Road, the Northern Pa-  
cific Company now has 413 miles of completed road, and  
by September next this will be increased to at least 560.  
A GOOD INVESTMENT. We are now selling, and  
unhesitatingly recommending, as a profitable and perfectly  
Safe investment, the First Mortgage Land Grant Gold  
Bonds of the Northern Pacific Railroad Company. They  
have 30 years to run, bear Seven and Three-tenths per  
cent. gold interest (more than 8 per cent. currency), and  
are secured by first and only mortgage on the ENTIRE  
ROAD AND ITS EQUIPMENTS, and also on  
23,000 ACRES OF LAND to every mile of track, or 500  
Acres for each \$1,000 Bond. They are exempt from U. S.  
Tax; Principal and interest are payable in Gold; Denom-  
inations: Coupons, \$100 to \$1,000; Registered, \$100 to  
\$10,000.

LANDS FOR BONDS. Northern Pacific 7-30's are at  
all times receivable at TEN PER CENT. ABOVE PAR, in ex-  
change for the Company's Lands, at their lowest cash  
price. That is, in addition to their character as a first-  
class, prompt-paying Railroad security, these Bonds are  
in effect Land Warrants bearing a profitable rate of interest  
until exchanged for Homesteads, at TEN PER CENT.  
PREMIUM.

SINKING FUND. The Land Grant of the Road ex-  
ceeds Fifty Million Acres, having an average soil of  
great fertility, in a climate that is simply unsurpassed.

The Trustees of the Mortgage, Messrs. Jay Cooke and  
J. Edgar Thomson, are required to devote the proceeds  
of all Land Sales to the repurchase and cancellation of  
the Company's Bonds. This immense Sinking Fund  
will undoubtedly cancel the principal of the entire issue  
of First Mortgage Bonds (now selling) before they fall  
due. With their ample security and high rate of interest  
there is no investment accessible to the people, which is  
more profitable or safe.

EXCHANGING U. S. FIVE-TWENTIES. In view of  
the Government's expectation soon to call for the surren-  
der of its outstanding 6 per cent. Bonds, under the  
present movement for funding the debt at lower inter-  
ests, many holders of United States Five-Twenties are  
exchanging them for Northern Pacific Seven-Thirties,  
thus realizing a handsome profit, and greatly increasing  
their yearly income.

OTHER SECURITIES—AGENCIES. All marketable  
Stocks and Bonds will be received at their highest cur-  
rent price in exchange for Northern Pacific Seven-Thir-  
ties. EXCHANGES ON Money or Bonds received,  
on Seven-Thirties sent in return, will be paid by  
the Financial Agents. AGENCIES for the sale of this loan  
are established in nearly every city and important town  
throughout the United States and Canada. Full in-  
formation, maps, pamphlets, etc., can be obtained on  
application at any agency, or from the undersigned.

Dewey & Co., U. S. and Foreign Patent Solicitors and Counsellors, Scientific Press Office. Principal Agency for the Pacific States. Established 1860.

Plate V of Illustrated Mechanical Movements, described in Dewey & Co's, 48 page circular of Information for Inventors. Sent post paid on receipt of stamp.

Patent claims for Pacific Coast Inventors fully secured in less time than through any other agency in the United States, and at less cost. If you think you have a valuable invention, consult none but the best and most reliable counsellors. They will obtain a valid patent if new, or save you expense, if old, by giving you honest and intelligent advice. All business relating to patent soliciting transacted confidentially and thoroughly.

DEWEY & CO., Patent Agents, No. 414 Clay st., San Francisco.

Scientific and Practical BOOKS — ON — MINING, METALLURGY, ETC. BY GUIDO KUSTEL MINING ENGINEER AND METALLURGIST. Published and Sold by DEWEY & CO.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-Silver, 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and contains full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his speciality. Price \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams, 1867. This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds in the most valuable facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864. As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator. Price, \$5 in cloth; \$6 in leather—coin. For single copies of the above works, or for the trade, address

DEWEY & CO., Publishers and Patent Agents, Scientific Press Office San Francisco.

And in accordance with law, and an order of the Board of Trustees, made on the 16th day of May 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the Company, 614 Merchant Street, Room 26, San Francisco, California, on Tuesday the 11th day of July, 1871, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. MARTINON, Secretary.  
Office, 614 Merchant street, Room 26, San Francisco, California. 25v22-3w

## BERRY &amp; PLACE, Importers and Dealers in MACHINERY AND SUPPLIES.

SAN FRANCISCO, CAL.

Sole Agents in Pacific States for Sale of

Blake's Patent Steam Pumps,  
Smith's Wood-Working Machinery,  
Davis & Furber's Woolen Machinery,  
The Swain Turbine Water Wheel,  
Wood, Light & Co.'s Machinists' Tools,  
Sturtevant's Pressure Blowers,  
Hardy's Portable Drillers,  
Dreyfus' Patent Self-Oilers,  
Gardner's Safety Stop Governor,  
Page's Belting, Etc., Etc.

We keep in stock the above, with a large variety of other Machinery and Small Tools.

## Dreyfus' Patent Self-Oilers and Cylinder Cups.

7 A saving in oil of 75 to 95 per cent. guaranteed. No trouble of "oiling up!" No waste of oil! No oil cans needed!

by the use of the

## NATHAN &amp; DREYFUS SELF OILERS.

These Oil Cups are too well known to require any lengthy description; the following are the main points of advantage.

We guarantee a saving of  
75 PER CENT OF OIL.

They are composed of a transparent Glass Cup, mounted in Brass, provided with a hollow tube, inside of which is placed a loose setting solid or hollow wire, which acts as a Feeder and Regulator. The wire rests constantly upon the Journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion.

They are as reliable in Winter as in Summer.

Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' constant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give perfect and entire satisfaction.

No testimonials are printed, but ask any one who has them what they think of them. Be sure you get Dreyfus'. Send for Circular and Price List to BERRY & PLACE, San Francisco.

## GARDNER &amp; ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.

The Governor Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, positive insurance against all accidents liable to occur from slipping or parting the Governor or driving belts, and a convenient arrangement for adjusting the speed of the Engine while in motion, without change of pulleys.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. Thus we warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheerfully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE or WITHOUT THROTTLE VALVE; and either BLACK or FINISH. Send for Price List to BERRY & PLACE, San Francisco.

## Nathan &amp; Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup to the public, we desire to call very particular attention to its many special advantages. First—Nothing but clean oil or tallow is admitted into the Cylinder; no time or money of any kind. Second—Its great economy of hot tallow and fuel. Third—It is self acting, and supplies the lubricating material only while the Engine is in motion. Fourth—Its certainty and regularity of feeding, and increase of the power of the Engine.

The principle upon which this apparatus is founded is that, instead of admitting tallow into the Cylinder in considerable quantities at uncertain intervals by means of tallow cups, grease cups, and other crude contrivances, and allowing it to be instantly blown out at the exhaust (as must necessarily be the case), this Cup, by its peculiar action, delivers the lubricant in drops into the body of the steam, which thereby becomes thoroughly impregnated or greased before passing into the steam chest or Cylinder; the consequence is, that instead of falling to the bottom of the Cylinder, as it does when admitted through a tallow cup (which passes the lubricant from the bottom of the Cup to the Cylinder), it enters into the form of minute globules, and hence the whole of the internal parts of the engine become regularly and constantly greased. The result of its action has been proved in a very great number of cases to be an enormous saving of tallow, a considerable increase in the power of the engine, a great saving in fuel, and reduction of internal friction to a minimum.

These Lubricators will save you 75 per cent. of the Lubricating Material, and cost no more than the common Compression Cups.

For further information, or Price Lists, address BERRY & PLACE, Importers Machinery and Mill Supplies, Warehouses, 112 and 114 California street, San Francisco.

## Marcelina Silver Mining Company.—Location of Works, Eureka District, Lander County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 2d day of June, 1871, an assessment of twenty (20) cents per share was levied upon the capital stock of said Company, payable immediately in U. S. gold and silver coin, to the Secretary, Room 21, Hayward's Building, 419 California Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 11th day of July, 1871, shall be deemed delinquent and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Tuesday, August 1st, 1871, to pay the delinquent assessment, together with cost of advertising and expenses of sale.

CHAS. E. ELLIOT, Secretary.  
Office, Room 21, Hayward's Building 419 California Street, San Francisco, Cal. 23v22-4w

## Mountain City Mining Company—Location of mines, Cope District, Elko County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 8th day of June, 1871, an assessment of Twenty-five (25) cents per share was levied upon the capital stock of said Company, payable immediately in gold coin, to the Secretary, at the office of the company, No. 264 Front street, San Francisco. Any stock upon which said assessment shall remain unpaid on the 15th day of July, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 8th day of August, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.  
Office, 266 Front street, San Francisco. 24v1-4w

## Ophir Copper, Silver and Gold Mining Company—Location of works, Ophir, Placer County, Cal.

## Machinery.

### WHY THE WILSON

### Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbag," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation. For further particulars address

FURMAN R. WILSON,  
San Francisco.

### GEO. T. PRACY'S MACHINE WORKS

109 and 111 MISSION STREET,  
SAN FRANCISCO.

MANUFACTURER OF

PRACY'S IMPROVED  
PATENT STEAM ENGINE

GOVERNOR.

These Governors are the most sensitive built, running at a high velocity and maintaining a uniform speed.

SOLE AGENT FOR

L. W. POND'S CELEBRATED TOOLS,

—SUCH AS—

Lathes, Planers, Drills, Boring Mills, Milling Machines, Etc.,

Which I will offer at very low rates. Also, MORSE'S TWIST DRILLS, AND CHUCKS OF ALL KINDS.

MANUFACTURER OF

Steam Engines, and Mill Work Generally.

Sole Agent for TAYLOR'S PATENT SHEARS AND PUNCHES.

### STEAM JET PUMP.

Blakeley & Williams' Patent.—For Water, Oils, Acids, Etc.,

The best cold water pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit:—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

Send for Circular. PARKER & HUNT, Southeast cor. Tenth & K Streets, Sacramento City Cal. AGENTS—CHAS. F. BROCK, 117 California st., San Francisco; KEOP & BARGION, Stockton. Can be seen at McAFFEE, SPIERS & Co's, Boiler Works, S. F. 21v21-tf

## THE AMERICAN SUBMERGED PUMP.

Has no leather packing, is composed entirely of metal, rendering it less liable to get out of repair than the ordinary packed pumps. It is admirably adapted for Irrigating purposes and for Watering stock.

As a Safeguard against Fire it has no Equal,

One of the medium size being capable of protecting an ordinary frame dwelling. In short it is an article that

Every Farmer should have on his Premises.

### PRICE LIST.

No	0.—Iron, \$15 ; Iron Galvanized, \$17 ; Capacity, 500.....	Gallons per Hour.
"	1.—" 25 ; " " 30 ; " 1,000 to 1,200.....	" " "
"	2.—" 40 ; " " 45 ; " 2,000 to 2,500.....	" " "
"	3.—" 70 ; " " 75 ; " 4,000.....	" " "

Larger sizes made to order of any required capacity. Hand power.

MANUFACTURED AND FOR SALE BY

PACIFIC PUMP MANUFACTURING COMPANY,

318 Pine street, San Francisco.

### CAMERON'S STEAM PUMPS.

PICKERING'S

Engine Regulators.

GIFFARD'S

INJECTORS.

BARTOL'S

STEAM TRAP.

Surface Condensers.

DAVID STODDART,

114 BEALE STREET, S. F.

### THE PATENT Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to R. STONE, 25v22-3m 422 Battery street, San Francisco.

AHEAD OF THE WORLD.

### THE NEW TREADLE POWER,

Just Invented, and used exclusively on the HOWE SEWING MACHINE.

With it any lady, however delicate her health may be, can run the Machine from morning until night with perfect impunity.

The Howe is the Best, Consequently the most Popular Machine in use. The Daily manufacture is over 500 Machines.

H. A. DEMING, Agent, apl5-3m No. 113 Kearny street, San Francisco.

### Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

### STURTEVANTS

PRESSURE

BLOWER,

Are for sale by

Berry & Place,

112 California st.,

San Francisco,

who have the different

sizes always in store. 4v22

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. E, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the operation of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. fcls-tf

## The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office. 16v20-3m JOHN F. LOHSE, Secretary.

## Oriental Powder Co.,

MANUFACTURERS OF

Blasting,

Mining, and

Sporting Powder,

Of superior strength and cleanliness.

Patent Compound for Blasting and Mining.

Electric Batteries, Fuses, and Leading Wire for Blasting.

## BOONE'S C-SPRING ROLLER SKATE.

PATENT GRANTED.

This SKATE surpasses in Elasticity, Durability and Ease of Operation, any other Skate in existence. Its superiority has been proved wherever it has come in competition with any other Roller Skate.

FOR DESCRIPTION SEND FOR DESCRIPTIVE CIRCULAR.

Warranted to run longer without requiring to be repaired than any other Skate.

Owners of Rinks will find it the most profitable as well as the most satisfactory to their patrons. The patentees guarantee the right to run this Skate to purchasers of rights for the full term of the patent, and

Warrant it to be no Infringement on any Existing Patent.

State, County, Town and Rink Rights for sale at reasonable terms.

Apply by letter or in person to

UNDERHILL BOYNTON,  
105 Montgomery Street, S. F., Cal.,  
General Agent for the United States.

## THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

**GIANT POWDER, A NO. 2 GIANT POWDER,**

Somewhat slower in its Explosion, which we recommend for

**BLANK BLASTING, COAL MINES,**

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD.  
It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.  
BANDMANN, NEILSEN & CO.,  
General Agents, No. 210 Front Street.

## Automatic Car Coupler.

It is impossible to read of the accidents constantly happening to brakemen and others while coupling cars, without wondering why some improved method of coupling has not been generally introduced. When we think that it is now upwards of forty years since the first successful locomotive was built, and that during that length of time the old method of coupling has continued in common use, the wonder increases. It is true that we have one or two devices applicable to passenger cars only, but they have met with no general adoption. Moreover, the great demand is for a coupler that can be put upon the freight cars as well as passenger cars. Upon the freight cars we have the greatest number of accidents and the greatest amount of time wasted in making up of trains.

Herewith we give side and top views of Vedder's car coupling, which is now being manufactured by the Self-Adjusting Car Coupler Co. of Gloversville, N. Y. This coupling gives immunity from accidents to brakemen, as they never have to step upon the track or between the cars in coupling. It is entirely automatic. The cars can be coupled as fast as the engine can back them up, an advantage which those who know anything of the time which is required in making up a freight train, will understand the value of. The construction is quite simple, and by means of the references easily understood.

Fig. 1 shows a top view, Fig. 2 a slotted link to couple with the ordinary huffers, and Fig. 3 a side view. *B, b*, huffer-hangers and stirrups; *e*, point of attachment of short disconnecting lever; *h*, hole for pin when using ordinary link; *K*, point of connection of levers, *L* and *T*, with grapples, *s, s*; *L*, disconnecting lever, which draws out the grapples *s, s*; *M*, head-block when coupling is not attached to center-plate; *m*, fulcrum for long lever, screwed into sill; *N, N*, bolts holding main following-block, *R*; *N', N'*, bolts which take the draught when the springs shut up under the strain; *r*, following-block for huffer-spring, upon which the spring keeps a constant pressure; *O*, bolts taking the strain in buffing when the springs close up—these bolts take the strain when the car is drawn by an ordinary link and pin; *P*, link; *p*, arrow-shaped head; *R*, main following-block, to which the jaws, *S*, are bolted by the bolts, *N, N*; *r'*, buffer-spring; *S*, side of jaw or grapples; *s, s*, jaws of grapples which hold the link; *s*, slot in link; *T*, short disconnecting-lever—draws out

one of the jaws, *S*; *W*, stringer, or sill of the car.

The above references make little description necessary. The jaws, *s, s*, are held together by the sides, *S*, which are of spring steel. These sides take the strain from the link and transmit it to the follower, *R*, where it is taken by the main-spring. The disconnecting is accomplished by the lever, *L*. When this is thrown over, by means of the short lever, *T*, and pieces, *K, K*, the jaws, *s, s*, are separated, allowing the buffer-block to throw the link out. This pressure is just sufficient to keep the link in position as shown in Fig. 3, ready to couple with any other car. The link is made of such a thickness that when turned upon its side it will slip between the jaws and disconnect, thus obviating any possibility of a car thrown on its side dragging

## Our Strongest Building Timber.

According to the *Alta*, late experiments at Mare Island show that yellow fir, preserved by hydro-carbon oils, is our strongest building timber, so far as known. Calvin Brown, Civil Engineer of the Mare Island Navy Yard, made a number of experiments, taking pieces of straight-grained wood, apparently without flaw or defect of any kind, one inch square and 36 inches long, resting on supports 24 inches apart, and then by weights attached half-way between the supports, ascertaining how many pounds were required to break the pieces.

The results were that California laurel broke under a weight of 387 pounds; oak, 413 pounds; and preserved fir, 462 pounds. The conclusion is that the fir is the strong-

## Interesting Mining Suit.

Last month an important decision concerning the Jersey quartz vein, near Hornitos, Mariposa county, was delivered in favor of the defendants. The *Mariposa Gazette* thus comments on the matter:

The reason of the public interest felt in the suit seems to be that it was understood that a prominent question involved in it was, whether according to mining rules and regulations, a miner has a right to enter upon a quartz vein upon public mineral land, and locate, and work and hold it, against a prior possessor, provided it has for many years been unused and unworked, and without such visible marks of improvement and claim as would reasonably show a design to use.

Early Thursday morning the jury rendered a verdict for the defendants, and judgment was entered accordingly. As, however, the question of what are the mining rules and customs was not the only one involved in the case, we are not informed whether the verdict was based wholly upon that point.

There are very many people in this county whose interests, present and prospective, are involved in the question most prominent in this action, and to whom it is important that mining regulations should be reasonably and clearly understood.

Canadian Pacific R. R.  
—Cal. Instruments.

Last week a corps of engineers, under charge of Messrs. Moherly and

McLennan, left this city for Victoria, to commence, on this side, the surveys for the proposed railroad from Montreal to the Gulf of Georgia. The building of so many transcontinental roads in the United States, and the desire to bind closely the different parts of the great country which acknowledges the same rule, and to aid in reviving trade and creating business, has stirred up the Canadian government in the matter.

A noteworthy fact in this connection is that the instruments to be used in the survey have been ordered of Mr. John Roach, of this city. It certainly is a remarkable compliment to this gentleman, and a source of congratulation to our coast, that the engineers of another country should come here for their instruments.

AN American journalist declares the breakdown of the two English Atlantic cables a "judgment" like that of Ananias and Sapphira, and for the same reason, namely, that their statements were often considerably in advance of the truth.

VEDDER'S IMPROVED PASSENGER AND FREIGHT CAR COUPLING.

the rest of the train further, while in form it gives a great surplus of strength over the ordinary link. This coupling is readily attached, and may be fastened without extra expense to any ordinary platform now in use. It possesses also the advantage of allowing a variation of ten inches in the height of the cars, and can be connected with any of the couplings now in use, either with its own links or those of the common kind. The cars are disconnected by a single motion of the lever, the handle of which comes to the side of the car, thus entirely obviating the necessity of the brakemen going between the timbers, and rendering any danger to him imminent only through gross carelessness.

This invention is in use on the Fonda, Johnstown, and Gloversville Railroad, and also on the Rensselaer and Saratoga Railroad. Both companies express themselves completely satisfied, and recommend it strongly. We have no doubt but that its adoption would prove a saving of time and money, and would tend to decrease the now too frequent number of accidents.

est wood. But as the paper alluded to dwells on the fact that by the preservation process some considerable increase of strength is attained, and as, apparently, the other woods were not thus treated (preserved), these results must be taken with some modification.

It is stated in this connection that the wooden platforms for heavy guns at Alcatraz, the Pavilion Hospital of the Navy Department at Angel Island, and the new breakwater at San Pedro are to be of preserved wood. It is also stated that Calvin Brown is preparing statistics with regard to the various kinds of building timber on our coast for the use of the Mechanics' Institute—information which will be of great value to the builders and the public generally.

A DREADFUL CATASTROPHE is reported from Mexico. At the silver mine of Quebrilla, one of the three great mines of the State of Zacatecas, a fire has occurred, by which over one hundred miners lost their lives.

## MECHANICAL PROGRESS.

**STEAM ON CANALS.**—The liberal reward of \$100,000 offered by New York State for the best system of canal propulsion, is attracting great attention at the East. We collate a few facts as to what has been done in late years in steam canal propulsion from the New York *Tribune*. In 1845, H. R. Worthington ran on the Erie canal for two seasons boats which, although unsuccessful financially, traveled at a high rate of speed without injuring the banks. The system of towing with wire rope, laid along the canal and passing over clip drums driven by engines on the boat, was introduced in Belgium in 1866, and is now successfully used in several places. The total cost is not one mill per ton per mile. The cost of paddle tugs on the Thames is  $9\frac{1}{2}$  mills, in France as high as 1.6 cents per ton per mile; of screw tugs on English canals,  $5\frac{1}{2}$  mills. There are various American patents. Among them are the following, which, however, have never been used practically. Mr. C. J. Harvey proposes to move small carriages, connected together by an endless rope working on a cable stretched on posts placed 20 feet apart on the tow path, the carriages having each a towing horn to which the tow-line from the boat can be attached. Messrs. Palmer, of Auburn, propose a chain on each side of the canal, lying along its bottom, into which fit cog-wheels on a shaft carried on the boat. Messrs. Emery & Leverich, of New York, propose a small steel rail suspended over the canal and grasped by two horizontal revolving pulleys placed on the boat. J. Read, of Catskill, substitutes for this a chain and cog-wheel working vertically. J. Roy, of New Orleans, designs using a moving cable on the tow-path, which pulleys, fixed to the side of the boat, will traverse. Narrow gauge locomotives and traction engines are proposed to replace animal power.

Worthington's boat was long and sharp in the bow. There was a wheel on each side of the boat (near the bow) with paddles inclined to the axis. M. J. Maiu, of Haverstraw, has a peculiar propeller in the bow, for which the present boats can be altered at a cost of \$650. Mr. Hunter has a similar device which can be attached at a less price. Both these have been in practical use. Mr. C. J. Smith, of Nyack, has a paddle made to open and close by iron rods connecting with the engine. The paddles are placed on each side of the keel at the stern, and near the bottom of the boat. At each forward motion the paddles close together, and at each backward motion they open, act upon the water, and propel the boat. Mr. E. Backus, of Rochester, proposes a wheel near the center of the boat, to roll on the bottom of the canal, and drive the boat as the driving wheels propel a locomotive. The wheel is placed, at the end of a lever frame, which can be raised or lowered as required by the varying depth of the water. These are the most prominent of the various plans proposed.

**PUTTING UP FENCES BY MACHINERY.**—A correspondent of the *Toronto Globe* writes, "I was lately much amused at a novel way of putting up fence posts. The implement employed was a 'pile-driver,' made as ordinarily used, with about twelve feet drop for the ram, but constructed of much lighter materials. The scantling was only 2x6 and 3x3 inches, with the exception of the sills, which were stronger, and made of hard wood, to facilitate moving about—an operation which was performed by the same oxen that raised the ram. The ram itself was composed of the butt of an oak log, six feet long, handed with iron at its lower end, and about sixteen inches in diameter. Grooves were plowed in it on each side, so as to admit of its moving readily in the guides. It was hoisted up by a yoke of cattle attached to a rope. About three blows drove the post nearly four feet into the earth, and almost all went quite straight. A few—one here and there—were crooked; but these, I was told, would be pulled straight with the cattle, or dug out at the foot, so as to allow of their being pressed over, until they all came in direct line. I was informed that this course was a great saving of labor, and when quickly handled, the time that each post required to be driven was only a few minutes."

**NAIRN'S STEAM OMNIBUS** lately made a trial trip from Edinburgh to Portobello, (Scotland) and back. The trip was considered satisfactory, and it is stated, that the owner of the omnibus intends running it daily.

**IRON BRIDGES.**—The Missouri will soon be spanned by six great bridges. Of these, two are completed, at Kansas City and St. Charles; two are approaching completion at Leavenworth and Omaha; two more will soon be commenced at Glasgow and at Atchison; and it is not improbable that still another will be built at St. Joseph. Over the Mississippi there are ten: the Rock Island, Clinton, Duquene, Burlington, Quincy and St. Paul bridges being already completed, while the St. Louis, Keokuk, Hastings and Winona bridges are in various stages of construction. The Ohio river is spanned by five fine bridges, located respectively at Cincinnati, Louisville, Parkersburg, Bellair and Steubenville, and another will soon be finished at Cincinnati. Across the Niagara river there are now two splendid suspension bridges, while the third, the great International Bridge, near Buffalo, is pushing forward as rapidly as the combined forces of capital and energy can make it. Over the Hudson there is already a fine bridge at Albany, and another is soon to stretch across from Fort Clinton to Anthony's Nose, opening a most important connection between the railroad systems of the Eastern and Middle States; while across the East river will soon be swung the great New York and Brooklyn suspension bridge. It is probable that the average cost of these mentioned has considerably exceeded \$1,000,000 each. The East river bridge will probably cost fifteen, and possibly sixteen millions before it is fairly completed; that at St. Charles cost about \$1,800,000; the St. Louis bridge is estimated at \$8,000,000; that at Kansas City cost \$1,200,000, and that at Leavenworth about \$775,000. A fair average would probably be somewhere about a million and a half for each of the great structures.

**AMERICAN TELESCOPES.**—In the manufacture of optical instruments, we are at this time leading all the nations of the earth. American microscopes, spectroscopes and telescopes are certainly superior to any made in Europe, and this is acknowledged by some of the best scientific observers of England and Germany. Tolles' and Wales' objectives are of the highest excellence, and none better have ever been produced. The telescopes of the Messrs. Clark, at Cambridge, stand at the head of all instruments of this class which are now made, and their orders, from parties at home and abroad, are much greater than they can promptly meet. These celebrated makers have recently received orders for two telescopes, of 25-inch aperture, which, when completed, will be the largest instruments in the world. The largest hitherto made has an aperture of 24 inches.—*Ex*

**COST OF PIG AND BAR IRON.**—W. E. S. Baker sends to the *Iron Age* a tabulated statement of the cost of manufacturing iron in Central Pennsylvania for each year from 1850 to 1871. According to this the cost per ton of pig iron was \$14.25 in 1850, rose gradually to \$18.87 in 1855, declined to \$16.11 in 1862, reached its highest point of \$32.21 in 1865, and is now \$29.65. Bar iron commenced at \$46.57 in 1852, rose to \$76.40 in 1855, fell to \$50.30 in 1859, reached its highest point of \$127.11 in 1865, and is now \$73.62.

**IMPROVED CEMENT.**—An exchange recommends the following as calculated to resist the effects of all solvents in use, and making a tight joint in machinery: "Ordinary commercial glycerine and well washed and dry litharge are to be thoroughly mixed, so as to form a stiff paste, which, however, must be used immediately, as it stiffens into a hard uniform mass in a brief space of time. For taking fine casts this substance is highly valuable, as it preserves the minutest detail and can be readily prepared for either receiving the galvanic deposit or used to cast from."

**STRENGTH OF IRON.**—The discussion as to whether the strength of iron is diminished by cold has led the *Iron World* to compare the reports published by the railway directors on the breaking of axles on German railroads from 1863 to 1869. The percentage is as follows: Dec. to Feb., 30.1; March to May, 22.6; June to Aug., 22.7; Sept. to Nov., 24.6. According to this, it appears that the breakage is more frequent in winter than in summer.

**PAPER.**—The latest application of paper is as lining for refrigerators.

## SCIENTIFIC PROGRESS.

**PROFESSOR TYNDALL ON "SOUND."**—Professor Tyndall, in delivering his sixth lecture, at the Royal Institution, on "Sound," began by stating that if the velocity of sound in wood were equal to its velocity in air, a rod of air in a tube, and a rod of wood of the same length, would both emit a note of the same pitch when they were made to vibrate longitudinally. But the velocity of sound in wood is much greater than its velocity in air. The lecturer then caused a column of air in a tube closed at its lower end, to vibrate longitudinally by blowing across the open end of the tube with his mouth, and thus the air gave a musical note. He then rubbed a rod of wood, 46 inches long, with a piece of leather covered with resin, and the wooden rod emitted a musical note of exactly the same pitch as that given by the shorter column of air. This proved that the velocity of sound through the particular kind of wood selected for the experiment was about sixteen times more rapid than through air. An open glass tube, twice the length of the other, was then sounded, and it gave the same note as the shorter one closed at the end; the speaker explained that this was owing to the fact that the air in the open tube divided itself into two vibrating segments, with a nodal point of no motion at the center of the tube, so that in fact the tube was virtually two closed tubes, placed base to base. A rod of brass, 72 inches long, was next sounded by the aid of the resined leather, and it gave a note of the same pitch as a column of air six inches long, contained in a glass tube closed at one end; hence the velocity of sound in brass is twelve times quicker than in air. The velocity of sound in iron may be determined in the same way; in brass the velocity of sound is 11,000 feet per second, and in iron 17,000 feet per second.—*Mechanics' Magazine.*

**UTILIZATION OF COTTON-SEED.**—Various movements have been made of late years looking toward the utilization of cottonseed, usually considered a burden to the cotton-planter, and in getting rid of which great ingenuity has been expended. Among the more recent propositions of the kind, that of the employment of the adhering cotton, and, perhaps, of the woody material, in the manufacture of paper, has been brought forward. Lately, large establishments have been started in the South for the purpose of obtaining the oil from the seed, the refuse being converted into oil-cake for fattening cattle. The crude oil brings in New York from thirty-five to forty cents a gallon, and the oil-cake commands nearly the price of corn, being said to equal it in its fattening qualities. Shipments of the seeds have been made recently in great quantity to Liverpool from New Orleans, one vessel taking over 10,000 sacks of the seeds, and about 1,000 sacks of oil-cake; and it is expected that these shipments will be followed up on a large scale. As over 2,000,000 tons of cotton-seed are every year produced in the South, we may well imagine how important it will be to our country should the whole of this now nearly waste substance be utilized in some form. The comparative value of winter refined cotton-seed oil and of olive oil may be gathered from the fact that at the latest dates the former is quoted in the New York prices current at 72 cents per gallon, while the latter with duty off brings only \$1 in gold.—*Agricultural Reporter.*

**A GAS TREE.**—Dr. J. H. Salishury, of Cleveland, Ohio, sends to the *Boston Jour. of Chem.* the following:—"In January last, Messrs. W. and N. Salishury, of Cortland Co., N. Y., went on to Mt. Topin to procure white oak lumber. Having selected a tree that would answer their purpose, they commenced chopping it down. The tree was two feet in diameter. When they had cut in about four inches on the east side, their attention was called to a peculiar sound issuing from the tree. Their first impression was that it contained a swarm of bees. On striking a couple more blows, the small chips and dirt commenced flying from the stump. On putting the hand down they discovered a strong current of gas issuing from a fresh crack in the stump. The odor was like that of confined air. This blowing continued for full five minutes, when for curiosity they applied a lighted match; to their astonishment the gas ignited instantly, and burned at least five minutes, with great heat, and a blue flame like that of alcohol. After the gas had all escaped

they finished chopping down the tree. They found a hollow in the stump about six inches in diameter. Their conclusion was, that the gas light was carburetted hydrogen, and had formed from the gradual decay of the wood. You can rely upon this statement, as being correct in every particular."

**THE GREAT TELEGRAPH NOVELTY** of the day, says London *Engineering* in its report of the Royal Institution Conversazione of June 6th, is Sir William Thomson's Syphon Recorder. It is a most marvelous combination of strength and weakness; and the strength and the weakness are so remarkably combined that it produces effects which, until its appearance in public, a few months ago, were totally undreamed of by the most sanguine of telegraph engineers. This instrument consists of a very powerful electro-magnet, between the poles of which (therefore in a magnetic field of great intensity) is suspended a core wound with fine silk-covered copper wire. This wire is put in the circuit of the telegraph line, through which the signals are received. The reading of the signals is effected by means of a syphon of capillary glass tube, about two inches long, the shorter end of which dips into a dish of ink, while the larger hangs down, in front of a paper strip moved forward by clock-work. The miniature glass syphon is connected by a very fine aluminum wire with the coil suspended between the poles of the electro-magnet, and is moved backwards and forwards as it is deflected to the right or the left. To persuade a camel to get through the eye of a needle would, under ordinary circumstances, not be a more difficult feat than to get ink through the capillary tube under ordinary pressure. But the way in which it is got through it, and not only got through it, but actually ejected in a tiny stream from the lower end of the syphon, is by the simple and ingenious expedient of keeping the ink electrified to a high tension. It is a well-known fact that, when any liquid is electrified, its particles repelling each other, it is enabled to flow through the finest orifice; and this fact, judiciously taken advantage of by Sir William Thomson, has enabled him to produce a frictionless pen-point. The electrification of the ink in the reservoir is done by a rotating electrophorus or replenisher, kept in movement by an electro-magnetic machine.

**HERSCHEL'S CHARACTER.**—The death of Sir John Herschel has called forth many tributes to his memory. One writer baving, however, declared that his great fault was a habit of flattery, which even affected his honesty as a critic and reviewer, and his manners as a gentleman, Prof. Tyndall thus vindicates his friend's memory:—"I think it was in 1854, and in presence of a Friday evening audience at the Royal Institution, that Faraday introduced me to Sir John Herschel. From that hour to this, through the advancing years, his character has grown in beauty to me. As I knew him better, respect ripened into reverence, and until I read the words of your correspondent, this feeling never encountered from the expressed opinion of others the slightest shock. During the past week I have sought to check and extend my data by reference to older men. I have conversed with many whose intimacy with Sir John Herschel extended far beyond the range of mine, and if their unanimous and indignant testimony be worth anything, I should hesitate to write the term that would most fitly describe your correspondent's quoted words. He may, perhaps, be able to make good his position, and he may even have the courage to give his name; but, as it now stands, I must regard his article, notwithstanding its apparent warmth of appreciation, as embodying the most conspicuous personal wrong to which anonymous writing has of late years given birth."

**THE SPHEROIDAL STATE OF LIQUIDS.**—From Leidenfrost's experiments, it seemed probable that a drop of water assumes the spheroidal state when the tension of the steam formed at its under surface is sufficient to support the pressure of the atmosphere plus the weight of the drop itself, and that, therefore, if the pressure be removed, a lower temperature must suffice to cause the phenomenon. E. Budde has proved this experimentally by means of the following apparatus: a glass bell jar was cemented on a copper dish standing in a water-bath; the bell was connected with an air-pump and exhausted, and by means of a simple arrangement a drop of water was brought on to the plate. It was found that when the pressure was reduced two-thirds more, the drop assumed the spheroidal state at a temperature of 83° C.—*Ex.*

## CORRESPONDENCE.

## Ageing Wine.

EDS. PRESS:—Your second article on the ageing of wine was read with much interest, as that has been to me a subject of considerable thought and study. Is it claimed as a new invention that wine can be improved or aged by motion and heat? I remember having read, over twenty-five years ago, of wine being sent in casks, to the West Indies, and the cask being slung to a frame made for the purpose, and then swung back and forth for time or until by exposure to the heat of the sun, with the agitation, a certain condition or improvement was produced.

I have now before me a work on wines, published in London in 1860. In the article on Madeira wine I find the following:

"Some seem to consider that heat and motion alone are sufficient to give the desired age, and I have heard of a cotton lord who used to sling his wines to the beams of his factory engines for a few months, and then pass off his wines as East India particular."

Heat and motion have been tried and no doubt thoroughly, and I think pressure has been recommended before, so that it is evident that we have something yet to learn in wine making or rather ageing wine. I must confess that I am skeptical of any process being found that will accomplish the desired object—except in a limited degree.

Grape juice is a very complicated liquid, and the changes that occur in it are but imperfectly understood. The chemist, Miller, says that, the ageing of wine depends partly on the gradual fermentation of sugar, and partly on the slow separation of saline matters, principally in the form of bitartrate of potassa, and the change of minute quantities of fragrant and aromatic ethers, supposed to be produced by the reaction of vegetable acids on the alcoholic part of wine.

Now we know that, the formation of a certain quantity of alcohol checks the fermentation; and we also know that a further change does gradually take place, resulting in improvement in the quality of the wine; and that change is ascribed to a slow continued fermentation, for want of a better or more accurately defining term.

The formation of the bouquet of wine, we can better understand from the method pursued in the manufacture of artificial fruit essences. That there are changes occurring in wine, other than those produced by fermentation, I can readily believe. The druggist has two methods of making tinctures, viz., percolation and maceration. By the first method the ingredients of which the tincture is to be made, are packed in the displacement funnel, and the liquid poured on gradually, and as it percolates downward, each fresh portion of the liquid displaces the preceding, all-ready saturated portion; now by this method the materials may be entirely exhausted, and yet the slower process of maceration (which is by allowing the mixed liquid and solid materials of which the tincture is to be made, to stand for some time before filtering off), makes, where aromatics are among the ingredients used, possibly not so strong, but a decidedly more aromatic and fragrant tincture. Apparently the different aromas are more perfectly blended together; and in making perfumes we notice the same blending, by time, of the various odors used, showing that some change is continually going on.

Now some similar action, no doubt, occurs in wine that produces the condition we call "age," after the rapid fermentation is checked. But can that condition be the result of fermentation? Can that chemical action, the result of which is the deposit of its contained salts, bitartrate of potassa and tartrate of lime, be called fermentation?

It seems evident that the condition of permanence may be obtained by the destruction or rather oxidation of the germs which are the active agents of any change or fermentation occurring in wine, and which germs are not all oxidized during the first or primary fermentation of the grape juice.

I would suggest, as an experiment that, on the occurrence of the succeeding fermentation thorough, systematic and

prolonged agitation be made by any suitable method so as to expose the wine to the action of the oxygen of the air, as rapidly as possible. No doubt the heat induced in the wine by the process of fermentation would be increased by the consequent rapid oxidation caused by the thorough and constant admixture of the air during the process, and the result of such action, at the higher temperature, would be the perfect oxidation of all matter susceptible of such change, and a permanent wine would be produced; provided, however, that the wine subjected to such action contained sufficient sugar to furnish the necessary quantity of alcohol; for unless the sugar is in sufficient amount, no process will make a wine of keeping quality—the acetous fermentation following rapidly the vinous in such cases. But I confess I am skeptical as to the possible amount of improvement by any quick process. A year or two of apparent age may be gained; but I doubt if the delicate and gradual processes of nature can be thus imitated.

VINO.

Sacramento, July 5th, 1871.

## Water Pipes for Domestic Service.

EDITORS PRESS:—There is a question in my mind which seems to be of sufficient general interest to warrant an answer through the columns of your paper.

What kind of pipe for conducting water for use in a family is the best, especially in the very important matter of health? All through the mountains lead pipe is almost universally used. In this vicinity the water is constantly flowing through the pipe into a reservoir. In such cases can the water be appreciably poisoned? Common gas pipe (iron) is also used, but if the water remains still, it often is colored with rust when drawn off. Will the pipe rust to hurt if the water is constantly flowing? When you inform us as to the best kind of pipe, if neither the common lead or iron pipe, please say if it can be got in San Francisco.

As health is the greatest physical blessing, it seems to me if lead pipe is injurious that the best substitute should be generally known. I have been told that the common galvanized iron pipe is worse for use than lead pipe; also galvanized sheet iron when used for tanks. Is lead pipe lined with tin any better? As our water all through the foot-hills is brought from springs in metallic pipe, the question is, what is best, as wooden logs are generally out of the question.

W. O.

Smartsville, June 10th, 1871.

The use of galvanized iron pipe is dangerous, and cases of poisoning are now well proved to have arisen from this article. Galvanized iron pipe is iron pipe coated with zinc. The zinc is changed by the action of most kinds of water to an oxide, carbonate or chloride, which are poisonous salts. We therefore warn our correspondent against the article either for conducting pipes or for tanks.

Lead pipe is the cheapest and most easily manufactured, and has often been used with impunity for long periods of time. But pure water has been shown to act quite energetically on it. Most waters, especially spring water, however, contain carbonic acid. The action is this: At first the lead is oxidized to a poisonous oxide of lead. If the water contains enough carbonic acid, this is changed further to the insoluble carbonate of lead, which coats the interior of the pipe, and thus protects it against further action. But organic or alkaline matter acts as a solvent on this carbonate. The gist of the subject is that lead pipe is not necessarily dangerous. But in order to be on the safe side, a chemical analysis of the water used is to be recommended. This will show whether it is safe or not.

Tin-lined lead pipe has no advantage over lead pipe, but the reverse is rather the case, as the combination of the two metals hastens the chemical action of the water.

Tin pipe, *i. e.*, of block tin, is safe. It is readily acted upon by some waters, but the salts are not poisonous. The pipe is, however, very expensive.

Iron pipe is perfectly safe. The only objection to it is that it rusts, is therefore not very durable, fills up, and, as our correspondent has remarked, often stains the water. But coating the pipe with asphaltum is said to protect against rust. Sections of iron pipe laid by the Spring Valley Company for conveying water to this city, which had been thus coated (by dipping in boiling asphaltum), have been found in excellent condition after lying ten years. Other material can doubtless be used with advantage.

## Circular Instructions.

TO GIVE EFFECT TO THE ACT OF CONGRESS APPROVED MARCH 3, 1871, DIRECTING DEPOSITS TO BE MADE FOR THE SURVEY OF PUBLIC LANDS, TO GO IN PART PAYMENT OF THE LANDS THUS SURVEYED.

DEPARTMENT OF THE INTERIOR,  
GENERAL LAND OFFICE, May 6, 1871.  
*Gentlemen:*—By an Act of Congress approved March 3d, 1871, entitled "An act to amend an act entitled 'An act to reduce the expenses of the survey and sale of the public lands in the United States,' approved May 30, 1862, the following became a provision of law:

"SEC. 11. And be it further enacted, That all such cases where settlers shall make deposits in accordance with the act, to the credit of the United States, for public surveys, such amounts so deposited shall go in part payment for their lands situated in the townships, the surveying of which is paid for out of said deposits, and effect shall be given to this act by regulations to be prescribed by the Commissioner of the General Land Office."

In order to gather the foregoing into effect, the following regulations are prescribed for your observance, viz:

When one or more settlers on public lands shall apply to the Surveyor General of the district within which such lands are situated, for the survey of a particular township, at his or their expense, that officer shall furnish to said applicant or applicants two separate estimates, one being the cost of the subdivisional survey of the surveyable portion of the entire township, and the other to cover the expense of platting the survey as required by the 10th section, act of May 30, 1862, and the resolution explanatory of the same of July 1, 1864. (U. S. Laws, vol. 10, p. 410, and vol. 11, p. 414, respectively.)

Settlers availing themselves of the provisions of the above quoted section shall deposit with a United States designated depository to the credit of the U. S. Treasurer, on account of surveying the public lands and clerk hire in the Surveyor General's office, in the district in which their claims are situated, the sums estimated as aforesaid, at the cost of the field and office work.

The Surveyor General will take precaution to estimate adequate sums, thereby preventing any deficiency in the payment of deputy surveyor, as well as for clerk hire involved in the service.

Where several settlers desire the survey of the same township, the necessary deposits to cover all expenses of the survey and platting may be so subdivided as to be proportionate to the amount of lands within the township claimed by each settler; this, however, is a matter to be regulated by parties applying for such surveys, but all applicants should be informed that the law makes no provision for the refunding of any excess of the deposit over the value of the lands taken; the excess, however, if any, over and above the actual cost of the survey in the field and office work will be refunded as heretofore under the resolution of Congress of July 1, 1864. (U. S. Laws, vol. 11, p. 414.)

No certificate of deposit can be received in payment by the Receiver for more than the cost of the land at Government price, and when the certificate is for more than that amount, the Receiver will indorse the amount for which it is received, and will charge the United States with that sum only, and not with the sum named on the face of the certificate.

Where the amount of deposit is, however, less than the cost of the land, the certificate will of course be received at its face value, and the remainder of cost of land paid for in cash.

Assuming that the estimated cost of survey (both office and field work) is \$850, which amount the party deposits, and the actual cost is \$800; the party will be entitled, under the act of July 1, 1864, to the \$50 thus deposited in excess of the actual cost of the field and office work; but he will not be entitled to the return of the \$600 deposited in excess of the Government cost of one hundred and sixty acres at \$1.25 per acre (amounting to \$200.)

If, however, there are several applicants, the amounts deposited by each can be equitably arranged among themselves, provided, of course, the aggregate deposits cover the estimated expenses of the survey and incidental clerk hire.

The Surveyor General shall distinctly state to the applicant that the application for survey and depositing of the money will give no preference right to the land where adverse claims exist and that all contests relative to lands applied for, whenever they arise, must be investigated and passed upon by a proper local land office

before pre-emption entry can be allowed or the deposit credited to the depositing settler, as the benefits conferred by the act of Congress, approved March 3, 1871, heretofore cited, inure exclusively to pre-emptors under existing laws.

In making his monthly and quarterly returns, the Receiver shall designate the lands in payment for which certificates of deposit were used by settlers under the law, describing separately in his receipts the amounts of such payments and the balances paid in cash, if any occur, crediting the United States in said returns with the acres and purchase money of the lands embraced by the class of entries alluded to, and debiting the same with the amounts of the respective deposits applied in payment therefore, as shown by the certificates of deposit which are to be sent up as vouchers with appropriate quarterly accounts.

Very respectfully,

WILLIS DRUMMOND,

Commissioner.

To the Surveyors General, Registers and Receivers.

## A Letter to the Secretary of the Treasury.

To the HON. GEORGE S. BOUTWELL, Secretary of the Treasury, Washington, D. C.

Dear Sir:—It is currently reported, and very generally believed, that Mr. Richardson, the Assistant Secretary of the Treasury, and Mr. Spinner, the Treasurer of the United States, are to spend the coming summer in Europe, there to assist in making arrangements for disposing of the new United States bonds to foreign capitalists.

If this be the case, is it not an acknowledgment, on your part, that there is in this country an inadequate supply of money? Certainly it is; for, if we have enough here, why send abroad to beg it in exchange for bonds, and pay to foreigners interest for its use? Making this acknowledgment, as you then clearly do, how can you logically and consistently avoid the conclusion that the time has now arrived when the country should have more currency? How can it be more readily or more cheaply obtained than by the government itself furnishing it? Why not, then, promptly and energetically advocate the reversal of the policy of your predecessor, Mr. McCulloch, and urge the reissue of the greenbacks which he retired?

It will, perhaps, be said that this is not the road to specie payments. Is your proposed policy such? Will you, with that policy, aid in the accomplishment of that result? Is an increase of our already enormous and alarming foreign indebtedness going to carry us forward a single step in that direction? Will it not rather retard us? and is the government doing its duty—is it following a wise policy in entering into competition with the railroad companies and those others who constitute the great army of American borrowers in foreign lands, and in forging additional chains wherewith this and future generations shall be held in financial bondage to European money lenders?

The government and the railroad kings having made up their minds that they will have more and cheaper money than the country has now to offer, I would most respectfully ask you whether, in your opinion, that point has not been reached where the people who also suffer for the want of an abundant and cheap supply of money, and cannot go abroad for it, should demand of their rulers that they also shall have more, and that it be furnished at home, and by the government itself? Why not yourself demand of Congress this addition to our currency as a means of heading off the wild scramble for European loans now fairly inaugurated, and threatening such disaster? Can so called "inflation" portend so great evils as a mountain of foreign indebtedness?

Most earnestly inviting your serious consideration of these interesting and important questions, I have the honor to be,

Yours respectfully,

HENRY CAREY BAIRD.

Philadelphia, 406 Walnut street, May 23, 1871.

NEW ENGLAND EARTHQUAKES.—W. T. Brigham states that, since 1638, 227 earthquakes have been recorded as happening in New England, and four previous ones are mentioned in Indian traditions. He thinks that probably there were once volcanoes in New England, and particularly in Connecticut. Prof. Dana dissents from this opinion.

MEERSHAUM is said to have been found in Patagonia.

## MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

### California.

#### ALPINE COUNTY.

**LEVIATHAN.**—*Monitor*, July 1st: We have continued good reports of developments in this mine, already proved one of the largest ore deposits in the country. Water has been a great obstacle in the way of sinking the shaft. Drainage through the lower tunnel is causing it to sink away about a foot a day.

#### AMADOR COUNTY.

**THE MINERS' STRIKE.**—*Dispatch*, July 8th: It was currently reported in Sutter creek last Monday night, that a compromise had been agreed upon between the strikers and mine owners, by which the miners were to resume their original positions in the several mines immediately after the Fourth; but, as they have not yet gone to work, and as the soldiers are still guarding the mines, we are inclined to think that there is something wrong somewhere. It is to be hoped, however, that the difficulty will be amicably adjusted hereafter long.

**A GOOD MINE.**—*The Ledger* of July 8th, says: The mine owned by Condo & Wilson, at Enterprise, in the northern part of this county, is proving very valuable. They are now down 125 feet, and as yet they have encountered no water. Three runs have been made on the rock, with a yield of \$15, \$16 and \$19 per ton. The mine is easily worked, and the vein increases in size as they go down.

#### BUTTE COUNTY.

**BULL CREEK MINES.**—*The Marysville Appeal* learns from Mr. William Campbell, just returned from the mines on Bull creek, a stream which empties into Butte creek, that he has relative at work there who speak in glowing terms of these mines. From the work of five men, for two and a half days, 48 ounces of gold were cleaned up. The gold is coarse, and worth from \$17.50 to \$18 per ounce. The "diggings" are surface, none of them being over eight feet to the bed-rock—a soft, shelly granite. The dirt pays from the top down, is easily washed and very free from large boulders. This company have secured about 300 acres by location and buying, all of which it is expected will pay. Want of water is the only drawback to the mines, the supply being very limited and unsteady. Extensive preparations will be made this summer for a successful mining season in the following winter and spring.

#### CALAVERAS COUNTY.

**QUARTZ OPERATIONS IN ANGELES.**—*Chronicle*, July 8th: We hear very flattering reports in reference to quartz mining operations in Angeles. The shaft in the Big mine is being sunk 100 feet deeper. As the work progresses favorable developments are being made. The mill is kept constantly running with good results. Eighty men are employed in and about the mine.

The Stickles lead and others in the vicinity are also being successfully worked. San Francisco capitalists are endeavoring to purchase several of the mines at Angeles, and negotiations are now pending.

#### EL DORADO COUNTY.

**GOOD NEWS.**—*Mt. Democrat*, July 8th: Georgetown is to have a new ditch—plenty of water is now a settled fact. The proposed size of the new ditch is from 10 to 12 feet wide on top, 8 feet wide on bottom, and from 4 to 5 in depth. It will have a carrying capacity of from 10,000 to 20,000 inches of water, miners' measure. The system of reservoirs located will supply 10,000 inches 400 days without the natural flow. By filling these reservoirs during the winter, there is no danger but the supply will be ample for the summer. The surplus water, after supplying the divide between the forks of the American river, will be taken to Sacramento, perhaps to San Francisco. The company will incorporate under the name of El Dorado and San Francisco Canal Co., with a capital stock of \$2,500,000. Next week they will commence on the final survey and location. The work will be under the superintendency of J. H. Crossman, Esq., assisted by D. B. Merry, surveyor. The parties in interest are pushing every branch with energy and a determination to success. They intend to have water at Georgetown by July next year.

#### INYO COUNTY.

**BULLION PRODUCT.**—Mr. M. W. Belshaw furnishes the *Independent* of July 1st with the following as the product of the Cerro

Gordo furnaces of V. Beaudry and M. W. Belshaw since Aug. 1st, 1870: "Number of bars made at Belshaw's furnace 23,680. Weight, 2,060,160 pounds. Days running time, 273; 14 days lost in repairing boiler, 14 days lost for want of water, and 31 days lost in repairs of furnace. Size of furnace 22 inches inside, and 8 feet high. Only one furnace.

V. Beaudry's furnace since October 1st, has produced 11,995 bars; weight, 1,019,575. Running time about 110 days. Size of furnace same as above.

A NEW MILL according to the same paper is being erected in Hot Springs District, three miles from Benton. It will have 10 stamps, and a Stetefeldt furnace—all first-class; San Francisco Capitalists are the proprietors.

**SILVER SPROUT.**—This company are about to let a contract for running a tunnel 600 feet in length, on their mines on Kearsarge mountain, to tap their principal ledges.

**THE UNION MINE** is making preparations to sink a shaft upon their ledge, which is situated in the Inyo range, about two miles south of the Eclipse.

**WATER TURNED ON.**—The four-mile water ditch of the Eclipse company is now completed, and the water turned on. Much credit is due.

**STARTED UP.**—Beaudry's furnace was again started up week ago last Wednesday, and in the first 24 hours run out 114 bars of bullion.

#### NEVADA COUNTY.

**MINING LOCATIONS.**—*The Nevada Transcript* July 6th, says that Peter Mulligan & Co. have located 1,600 feet on a quartz ledge on Mary's Ravine, in Grass Valley township, adjoining the claims of Con. Reilly & Co., and near the Ophir Mill.

The same paper says that W. H. Talbot and others have located ten claims of 100 feet each on the Buckeye Ledge on Dead Man's Flat, Rough and Ready Township.

#### PLACER COUNTY.

**THE WESKE MINE.**—*The Auburn Stars and Stripes* of July 6th says that the Weske claim, at Turkey Hill, a short distance above Michigan Bluff, yielded \$4,033.50 for the week ending June 26th, and \$4,404.25 for the week ending July 1st, giving a fraction over \$23,000 for the four weeks ending with the latter date.

The Yule claim, at Startown, two miles above Last Chance, yielded a fraction over one hundred and two ounces for the week ending July 1st, and dividends exceeding \$6,000 for the month of June. The Weske dividends exceeded \$20,000 for the month. We claim that in the Weske, Yule and Baragon, Placer county can boast the three richest gravel and cement claims in California, and that the Gresne, St. Patrick, Ophir and Rising Sun are unsurpassed for rich quartz.

**THE DILLON MINE.**—This mine, says the *Placer Herald*, has been put in good working shape by the erection of power pumps, hoisting works, &c. The shaft has been pumped out and is now down to a depth of near 60 feet, at which point the full ledge, 3 or 4 feet thick will be shown in the bottom of the shaft. This ledge, so far as worked has been very rich, all the rock taken from it having averaged by mill working something over \$80 to the ton. The claim belongs to three working miners, John Dillon, Jacob Cowan and P. Hines, but from present appearances they will soon have to drop the pick and shovel and turn their whole attention to hosing the mine and taking care of their money.

#### SIERRA COUNTY.

**NEW MINE BEING DEVELOPED.**—*Messenger*, July 8th: Some time since Dr. Biber, in the interest of capitalists at San Francisco, discovered a quartz ledge in the ravine just below the watering trough on Goodyear Bar Hill. Men were set to work and the result was a ledge 12 feet wide and prospecting well. O'Neal and Livingston, two of the owners, are now here to take measures for erecting a quartz mill on the ledge.

**THE UNION CLAIMS.**—The same paper gives, through a correspondent, the following:—The Union claims, F. Cassidy, Foreman, are working from 30 to 40 men. Length of main tunnel 3,000 feet. An improved apparatus (not described) is used for dumping cars. The dirt is brought up the incline by a water-wheel. The cars in the mine are drawn by mules, and delivered, by contract, at 5½ cents per load; 60 loads per shift are taken out. Daily gross receipts from \$500 to \$700, expenses, \$100. The claim has been worked since 1855, and \$150,000 were expended before any dividend was declared.

**THE EAGLE CLAIM.**—The Eagle claim, just above Port Wine, reported as "played out" a couple of years ago, is now paying wages, with prospects of paying better

after a while. T. T. Davis is foreman, and under his direction work is progressing in fine style. Length of main tunnel 1,200 feet, 700 of which is in bed-rock.

#### TRINITY COUNTY.

**A RICH RAVINE.**—*The Trinity Journal*, of July 8th, says: One short blind ravine on Oregon Gulch, to be seen from the road leading to Junction City, and not more than three or four hundred feet long, has lately yielded \$80,000. One hundred dollars a day to the man was rocked out for a number of days in succession by the fortunate discoverers.

**COARSE GOLD IN DUTCH GULCH.**—The same paper says that Mr. H. W. Markey, during two months, last winter, took out of Dutch Gulch \$1,000, working alone. The ravine obtained its name from having been mined for some time, in years gone by, by two Germans. They had sunk a hole within four feet of the largest piece found by Markey. Mr. M. has sold out to a company of Portuguese.

**BUCKEYE.**—Mining is over on Buckeye, the water having given out, and some of the hoys have done well. This stream has been twice worked and abandoned. A few years ago, a gentleman who had worked there in early days, after having run after every mining excitement, came back to Buckeye. The first season after his return he struck it big, finding one piece of gold several hundred dollars in value. Since then it has been worked by several companies, every year paying well. The great drawback is a scarcity of water.

### Nevada.

#### ELY DISTRICT.

**DEFIANCE.**—*The Ely Record*, of July 2d says this mine has been worked steadily of late and considerable ore taken out. The proprietors, Wilson & Co., are shipping ore to Meadow Valley, and are expecting handsome returns. There are several other mines near by, partially developed. A great obstacle to the prosperity of this locality is the lack of a custom mill near by.

**BULLION SHIPPED.**—Wells, Fargo & Co. shipped, from July 2d to the 5th, through their agent B. F. Sides, bullion valued at \$44,777.25. Pretty good.

#### EUREKA DISTRICT.

**RETURN OF PROSPECTORS.**—*The Sentinel* of July 6th announces the return of a party of prospectors, who have been gone some three months to the east and south, as far as the cotton wood country in Utah. They found several promising mining localities; but that of chief interest was in the Troy district, 120 miles southwest, from which beautiful specimens were brought.

**NEW STRIKE.**—Messrs. Steele, Handson and Sprague, after sinking for some time in New York canon, concluded on Thursday to discontinue work on Saturday last if no mineral was reached by that time. Early Saturday morning they struck a promising vein. Promising discoveries have also been made about 30 miles west of Eureka.

**THE WAR EAGLE MINE.**—The same paper says that this new mine is assuming immense proportions, with a fine show of ore. The iron rock has given way to the ore which is widening. Shaft now 26 feet deep. Assays have been obtained of apparently average rock as it now appears in the shaft of \$121, \$288 and in one instance of \$705.

**GOOD YIELD.**—Up to the 7th inst., for the month of June, the Eureka Consolidated had smelted 325 tons of bullion. The company is sending the bullion to New York, and although the price of freight is much increased, it is gainer over what it would be if sent to San Francisco. We are promised that for July we can report 500 tons of bullion produced by the Eureka Consolidated. The ore is yielding a better per cent. of silver than ever before with enough in sight to make 3,800 tons of bullion.

#### REESE RIVER.

**BULLION FOR JUNE.**—During the month of June just past, says the *Reese River Reveille* of Austin, there were shipped through the office of Wells, Fargo & Co., in this city, 106 bars of silver bullion, weighing 8,645 pounds of the value of \$102,065.83.

#### WASHOE.

**SAVAGE.**—**WATER SUBSIDED.**—The great rush of water recently encountered at the lower levels of the Savage, has subsided considerably, and is now getting pretty well under control. It is out of the Hale & Norcross altogether. When the tunnel and drift have been cleaned out, there will probably be an opportunity for discovering the cavity whence the rush of water came. The old upper hoisting works have undergone quite a renovation. The building

has had a new front added to it, and is put into good condition.

**KENTUCK.**—*Gold Hill News*, July 7th:—This mine is looking and yielding well at the present time, and the bullion shipments for the month of June amounted to \$23,000. Very little prospecting is being done but in the course of two or three months a drift will be run from the 1,300-foot level of the Crown Point, in order to prospect the Kentucky at that depth. Meanwhile the Company will do no prospecting, but quietly go on taking out ore.

**OPHIR.**—The shaft is 830 ft. deep—105 fathoms its former depth—rock hard but blasts well—little water. It is now expected the depth of 1430 feet, which is contemplated will be reached much sooner than was expected. A new station and drift for the ledge will be opened at each 200 feet.

**SIERRA NEVADA.**—*Gold Hill News* 5th: John Lambert, Esq., the new Superintendent of the Sierra Nevada mine, has fully entered upon his duties, and is overhauling things generally. Mr. Lambert is one of the oldest and most experienced Superintendents on the Comstock, and with an honest and reliable gentleman in whatever position he may be placed.

**LADY BRYAN.**—Same paper, 7th: This valuable mine still continues its remunerative yield, and the ore producing sections are looking excellently, with good prospects for plenty of pay ore for a year or two at least. The last shipment of bullion amounted to over \$7,000. The mine is being systematically and profitably worked under the present management.

**CALEDONIA.**—In this mine they are sinking for a new level 400 ft. deep, or 100 ft. below their present lower level. With this new section of their shaft they are down 50 ft., rock hard and requires to be blasted, taking out excellent ore on their 300-foot level, and very good quality on the 200 foot-level.

**CONCOLIDATED VIRGINIA.**—The quartz in the south drift has of late considerably improved in appearance. It can be worked with picks, and there is no water to inconvenience the workmen.

**DIVIDEND.**—A dividend of \$10 per share has just been declared by the Crown Point.

**SUTRO TUNNEL.**—*Enterprise*, July 7th: The Suto Tunnel Commissioners visited the tunnel on the 3d and were well pleased with the point selected for beginning the work, and with what has been done. No better route could have been selected, as the tunnel will pass under several ravines and hasins, which will much favor the sinking of the several shafts to be put down along the line for the purpose of working at once at various points. Tunnel in 2,178 ft.

**BULLION—QUARTERLY REPORT.**—*The Gold Hill News* says the shipment of bullion from the office of Wells, Fargo & Co., for the quarter ending June 30th, amounted to 1,905 bars, worth \$3,265,412.63. The shipment for April was \$1,040,042.51; for May, \$1,148,787.53; and for June, \$1,076,532.59.

**BULLION RECEIVED.**—*Enterprise*, July 7: There were yesterday received at the Bank of California, in this city, \$70,000 in silver bars, from the Crown Point and Yellow Jacket mines.

### Arizona.

**RICH ORE.**—The Tiger ledge, Bradshaw District, is turning out some rich ore. Some of it much resembles the black sulphurets from the Yellow Jacket in Washoe.

**CHEERING PROSPECTS.**—*The Arizona Miner*, says: "These are the metallic times that cheer the prospector and miner.... The California spirit of '49 is rampant among our people.... Gladly would we dilate upon the great ledges of Bradshaw, Yavapai and Dassayampa Districts; but, at present, this no time or place to do so. All we can say is that the Tiger lode more than equals any mine we have ever seen, and there are scores of ledges in our mountains nearly equal to it.

Silver bricks are now quite common in Prescott, and silver ore that assays from \$100 to \$10,000 per ton may be seen in almost every house.

A piece of ore from the Lone Star, weighing three pounds, was tested last week, and produced at the rate of \$630 to the ton. A party of men left on Monday to commence work on this mine.

The Jackson Bros. expect to have their quartz mill in operation, at Bradshaw, within three weeks, crushing ore from the Del Pasco lode. This is one of the richest gold ledges in the district, and Jesse is determined that it shall yield him a gold brick by the 1st of August.

Mr. Porter came in from the Colorado river via the Hardyville route, one day this week, and gave us very encouraging

news from the mines of the Hualapai District.

Colorado.

CLEAR CREEK COUNTY.—Cor. of the *Register*: M. E. Birdsell has sold his interest in the Comet lode. Very little mining is now going on in that section. Two silver bricks are shown at Bank of J. B. Chaffier & Co.—One valued at \$1,082, taken out by Palmer & Nichols; the other valued at \$1,122, was from the International mill, Argentine, taken out of 7 tons of Belmontore. There is about 60 tons of some quality on the dump.

A small lot of ore dug out of the Equator slide, was sold to Stewart at \$673 per ton.

Palmer & Nichols are working steadily. Stewart's works are filled with mechanics, setting up the machinery of the Arey furnace.

SUMMIT COUNTY.—Correspondence *Central City Register*: George Day is running two flumes 600 and 500 ft. in length respectively, working ten men, has considerable ground stripped, and is averaging about \$10 per day to the man. Calvin Clark is working fourteen men, in about 1,500 feet of flume, and as heretofore, is averaging about \$10 a day to the man. J. Todd is working four men, has in about 800 feet of flume, and is in good pay. The Badger Flume Co., owned by Rood, Clark, Eysler, & Co., William McCartney, Superintendent, have in about 500 feet of flume, and are working three men. They expect to reach bed-rock inside of two hundred feet, at which time they will probably realize handsomely. The Grant Flume Co., owned by Huff, Pollock, & Co., have in 1,700 feet of flume, and are working eleven men. They are running the flume, and also side drifts, all of which prospect largely.

On Stillson's Patch, west side of French, Mr. Sissler is taking out good pay. Mower & Hays developed some good ground in the Patch last winter. Pearce & Co., (late J. McFadden,) will start up in a few days, and without the least doubt will average \$10 a day to the man.

FRENCH GULCH is about five miles long, and with Stillson Patch, has about 17 miles of ditches, 6,700 feet of flume, five hydraulics, eight families, and a population of about 105. A large number of lodes have been discovered in the vicinity, many of them somewhat developed.

Gold Run retains its former reputation, and is being worked by a number of companies who are all averaging about \$10 per day to the man.

Delaware is being worked by five men, who are taking out good pay.

Galena is worked by two companies, who are doing well. Galena is covered by a five-mile ditch and uses two hydraulics.

Georgia, Humbug, and American gulches are owned by six companies, and are the richest in the county, realizing from one to two ounces a day to the man, with a few inches of water.

THE CORINNE REPORTER says that reliable advices have recently been received from Cariboo showing that extensive gold-fields exist, and that the yield will be large. A letter received last evening by Mr. Kupfer from Mr. Meyer, a reliable gentleman mining at Cariboo, states that active mining had but just commenced, and that the most encouraging results had been obtained from "several clean-ups." Two men working the claim immediately above the writer had made their first "clean-up" the evening before the date of the letter from a ten-hors' run, and they realized \$23 and some cents in good dust. Several other important results are reported.

The Salt Lake *Tribune* also gives favorable accounts from that region and says that board is only \$8 per week, and miners seem to be making from \$3 to \$15 per day to the hand. The town has four stores, three saloons, two carpenter shops and one blacksmith shop.

Idaho.

MINING ACCIDENT.—The Silver City *Avalanche*, July 1st, says that on the previous Tuesday as H. S. Babcock was at work for Thompson, & Co., in the Mahogany mine, a fragment of rock from a blast struck him on the front part of the inside of his thigh, tearing and mangling the flesh in a terrible manner and producing a frightful looking wound, although, fortunately, no bones were broken.

CHINAMEN.—Three Chinamen were killed in an affray at the Loon creek mines. They had become obnoxious on account of their thieving propensities, and refused to leave the place when ordered to do so.

BULLION SHIPMENT.—Wells, Fargo & Co. shipped from Silver City nine bars of hulsion, valued at \$18,831.68 during the last week in June.

Montana.

FRENCH GULCH.—Mr. J. L. New, of French Gulch, informs the *Independent*, of June the 30th, that there are now companies at work on the main gulch and tributaries. Three hydraulics are in operation and the prospect is very good for large clean nps. There are three bed-rock flume companies at work, all of whom will do well this season. The swamp Co., cleaned up \$2,000 last week.

GERMAN GULCH.—The same paper states that although but little money has heretofore been taken out here, yet, during next week there will be a considerable number of clean-ups. The McCleary Bro.'s cleaned up last week \$1,650—the largest amount taken out by one company this season.

A GREAT ENTERPRISE.—One of the most important enterprises ever undertaken in this region, says the journal above quoted, is the undertaking of the Humphrey Bros., of Butte City, to bring the waters from the eastern side of the range to the rich placers on the western slope of the mountains. To do this a tunnel has to be cut through the main range of the Rocky Mountains. The ground is known to be very rich and covers an area of 10 miles square.

IN AND ABOUT NEVADA.—The *Montanian*, Virginia City, June 29th says:—Messrs. McGovern and Donegan are working their claims opposite Adobe Town, and are moving more dirt, this year, with less labor than on any previous year. They are making \$12 a day to the hand.

Seaville & Wonderly, working opposite Nevada, have their ground in good shape, and are taking out from eight to ten dollars to the hand.

Davis & Co.'s flume, just below Nevada, is running successfully and paying well.

Utah.

THE Salt Lake *Herald* furnishes the following: A heavy body of rich ore has been struck at the Monitor and Magnet mines in Little Cottonwood, some of it running as high as \$1,200 to the ton.

The purchase of Sevenoaks & Co., in American Fork district, is turning out about nine tons of hulsion a day.

The mines in Camp Floyd district are turning out well. One company is arranging to expend from \$3,000 to \$4,000 a day in developing the Sparrow-Hawk mine.

The Merced Cotton Experiment.

We have received a specimen stalk from Col. Strong's cotton plantation in Merced, which measures 24 inches in length. This shows a good growth for less than eight weeks from planting. The stand, we are informed, is considered a very good one; much better than could have been expected from the unfavorable weather which has prevailed since the plants made their appearance. The fields did fair to turn out far above the average of the best lands of Mississippi and Tennessee, even in their best seasons. We regard the experiment as one of the most important ever undertaken in the State. If it is successful this year, notwithstanding the drouth and the cold, windy weather which prevailed throughout the month of May and a part of June, we may regard the problem of cotton growing in California as definitely settled, and a mine of wealth opened up to the State, worth more than our either gold or grain. We shall carefully note the progress of the growth and maturing of this crop, and publish the same for the benefit of our readers, as many of them will no doubt, in the event of Col. Strong's success, feel encouraged to test the soils of their respective farms, with a view to this crop—one of the most profitable which can be grown.

COAL NEAR ST. LOUIS.—The discovery of a superior quality of block coal, within eight miles of the river and within ten miles of the furnaces and rail mills at Carondelet, is an important step towards establishing the supremacy of St. Louis, as the great iron manufacturing center of the continent. This bed of coal is believed to cover an area of 1,800 acres, and it is said that the coal is equally as good as the Indiana block coal, now used at some of the furnaces, and can be furnished at half the price paid for the Brazil coal. The vein is five feet thick, with a limestone roof, and clay floor, and is free from slate and sulphur. From the coal bank to the river is a good grade for a narrow gauge railroad, on which the coal can be transported directly from the mine to the stock-house of the furnace in the same cars.—*Jour. of Commerce.*

Mining Stock Market.

[San Francisco Stock and Exchange Board.]

THURSDAY EVE., JULY 13, 1871.

The mining stock market has fluctuated very considerably during the past week. The Board had a recess the previous week, meeting again last Thursday. Eureka has sold several times at \$53 to \$55.

DIVIDENDS.  
During the month of June, dividends were paid as follows: Chollar-Potosi, \$2 per share, \$56,000; Crown Point, \$10, \$120,000; Eureka (Cal.), \$1, \$20,000; Greenville (Cal.), \$1, \$4,000; Natoma W. & M., 1 per cent., \$3,000; North Star (Cal.), \$4 per share, \$12,000; Raymond & Ely, \$1, \$30,000; Redington Quick-silver, \$5, \$6,300; Yellow Jacket \$2.50, \$60,000. Total, \$311,300.

CHOLLAR-POTOSI.  
The annual meeting of the Chollar-Potosi M. Co. was held July 10. The following were chosen Trustees: A. K. P. Harmon (President), J. D. Fry, W. Norris, A. Bull, J. H. Dobinson, H. C. Kibbe and J. Freeborn. Secretary, W. E. Dean; Superintendent, I. L. Regua.

From the Superintendent's report, which we have received, we extract the following: During the past year, 84,681 tons of ore have been raised, against 56,636 tons raised during the previous year. The amount of ore milled during the past year was 83,775 tons, and the value of bullion produced, \$3,444,023.

The average yield of the ore and the cost of milling and mining for the two last fiscal years were:

	1869-70.	1870-71.
Average Yield of Ore per ton.....	\$24.86	\$41.30
Cost of Milling per ton.....	12.81	12.06
Cost of Mining per ton.....	3.99	4.69
Profit per ton.....	\$8.06	\$24.61

The receipts for the year were: From Bullion, \$3,444,023; Reclamation from Mills and Premium on Bullion, \$20,902, Miscellaneous, \$11,010; Total, \$3,475,935. Cash on Hand, July 1, 1870, \$128,253. Total Expenditures, \$3,403,467. Cash on Hand, July 1, 1871, \$200,721. Dividends paid, varying from \$1 to \$5 per share, foot up to a total for the year of \$1,946,000.

The report is a very flattering exhibit for the company, and looks extremely well for the management.

QUOTATIONS.  
The following table gives last Thursday quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock during the week.

AGENTS CAN MAKE FROM \$1,000 TO \$5,000 A YEAR in most any section of the country, selling Dana Bickford's new and improved FAMILY KNITTER. This Machine is guaranteed (in its present completeness) to meet every want of the household for either domestic or fancy work. Price \$25. Send stamped envelope with full directions for an illustrated book. Address DANA BICKFORD, Vice President and General Agent, 639 Broadway, N. Y. 237-22-6m-hp  
LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine at bargainably low prices may apply to No. 294 Bowery, 157 E. 25th, 477 9th Ave., New York Good work at high prices if desired. 21v1-12mhp

## PATENTS & INVENTIONS.

### Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING JUNE 27TH.

IRONING AND STRETCHING BOARD.—Jacob W. Davis, Reno, Nev.

VEHICLE.—Clark Elliott, Woodland, Cal., assignor to himself and Nathan Elliott, same place.

PUNCHING-MACHINE.—Daniel Anderson Faulkner, Centerville, Cal.

FURNACE FOR ROASTING ORES.—Frank Kessler, San Francisco, Cal.

CHURN.—Thomas Bee Parke, near Downville, Cal.

PORTABLE POWER-PRESS.—Thomas B. Wait, Zena, Oregon.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

LAMP.—M. Samuels, S. F. This is one of the class of lamps known as fountain lamps, in which the oil is contained in a vessel surrounding the burner tube so as to provide a fountain from which the oil is fed by connecting tubes to the burner. This invention consists in so connecting the fountain with the central vertical oil tube that a free and open space will be left between the two at all points. It also consists in surrounding the vertical oil tube with an outer tube, so as to leave an air space between the two. The burner is secured upon the outer tube, while the oil is contained in the inner one, and the latter, by this construction, cannot become heated and therefore all danger of explosion is avoided.

MOP HEAD.—J. Brizee, Alvarado, Cal. This invention consists in employing strong wires or rods which are secured to the mop handle and bent so as to lock over one another and bind the mop cloth between them. Another wire is arranged to slide upon these so as to hold them tightly or to release them. The device is very simple, cheap and durable.

ROASTING FURNACE.—J. S. Akin, Rye Patch, Nevada. This is a furnace designed to effect the oxidizing or chloridizing roasting of ores in a quick and comparatively inexpensive manner. The inventor has spent considerable time and money in perfecting the construction and claims to have arrived at satisfactory results.

BRANCHING CORN.—Mr. Call (of the well known tool-manufacturing firm of Bemis & Call, Springfield, Mass.) recently called our attention to a stalk of branching joint pop-corn, presented to him by the original propagator of the species, Mr. Judson, of Cuba, N. Y. The stalk, 41 inches long, contained 9 matured ears of an aggregate length of 44 inches. The specimen is a curiosity, which has required years in its production. The seed is now for sale in New York. We have a sample for planting next season.

A WHITE LEAD MANUFACTORY is to be established in San Francisco during the present year, by a gentleman connected with a very successful company in the East. A new and improved process, we are assured, will be used. Thus manufactories are commencing to be drawn to our coast.

### Editorial Notes Eastward.—10.

Echo Canon.—U. P. R. R.

Journeying on, we come to Echo City, a quiet little settlement, prettily situated. Then, leaving the Weber, we run off to the left, up among the hold red sandstone bluffs of Echo Cañon, where many a fantastic shape attracts our attention.

One of the first of these is Pulpit Rock, so called, partly from its appearance, and partly from the fact that from its summit Brigham Young preached (or is said to have preached) his first sermon in Utah. Then there is Monument Rock, the "Great Eastern," Dead Man's Rock, and numerous others. The massive walls of stone grow higher and higher and tower far above us, rising as mighty castles, huge cathedrals and rugged battlements.

PULPIT ROCK, ECHO CANON.

The cañon presents many an imposing view, mostly on the north side, however, and the travelers all congregate on the left side of the cars to see them. We can catch but brief glimpses as we hurry by, but these glimpses give us grand ideas of

present, and, of course, no adequate description can be given of it. But it has been visited by some of the curious in the neighborhood, and penetrated to the distance of half a mile or more. The entrance to it is from the east, just above the margin of the western shore of the Missouri

HANGING ROCK, ECHO CANON.

nature's agencies in these remarkable regions.

The Mormon fortifications are pointed out, and the old Emigrant Road with its most dramatic of histories. Soon we come to the Hanging Rock, [illustrated from Croft's Transcontinental Tourist Guide], jutting out from the face of a cliff like half the arch of a bridge, and threatening, as it has threatened for years, to fall in ruin from its position. So we ride swiftly on through the mighty places, turn into North Echo Cañon, with its Castle Rocks from 500 to 2,000 feet high, finally plunge through the longest tunnel on the Union Pacific, 800 feet long, and come to Wahsatch.

April 13th.

IMPORTED STOCK.—Among the blooded stock brought into California this season, were five Ayrshire yearlings, for James Quinn and others of Yreka, and a Clydesdale stallion and mare, for James Vance, of the same neighborhood. They were sent out by F. D. Curtis, from New York, at a cost for freight of \$600 for a car-load.

### A Wonderful Cavern.

There is, within eighteen miles of Helena, one of the most wonderful caves in the world.

The Vermillion Buttes, a beautiful and picturesque range of hills, lie a little north of east from Helena, on the Missouri river, terminating abruptly at the Spokane Pass and Beaver creek on the south, and bounded on the north by the Prickly Pear cañon. They are dotted here and there with isolated pines and little groves, are covered from base to summit with a dense and luxurious growth of bunch grass, are traversed with regularly defined rocky ledges, forming beautiful avenues, and on top of the highest mountain there is a beautiful transparent spring, affording abundance of water. Beneath these buttes, mountains or hills, is an extensive subterranean cavity, whose boundaries and form have never been discovered by white men. This vast cavern is a perfect mystery at

the howels of the hill, and has been followed by the footsteps of men for several hundred feet. It is believed that this is an entrance to the cave, and if so, it is at least three miles from that on the Missouri first mentioned.—*Helena Gazette*.

### The Wild Peach of Nevada.

There grows in Nevada a species of wild peach which is exceedingly hardy and will live nearly everywhere that the sage brush can exist. It is found especially frequent in Carson Valley, Humboldt Valley and on the hills around Reese River, perhaps also elsewhere.

This tree grows to about the height of a man's shoulder in the most favorable localities, but is frequently found not over a foot high. The leaf is small and thick, more like that of the plum. In the spring of the year the plains are covered with the beautiful pink blossoms. The fruit has the perfect form of the peach, is greenish with a crimson tinge, of small size, not over  $\frac{3}{4}$  to 1 inch in length, and is very bitter to the taste.

Dr. A. Blatchly, who furnishes us with the above information, says that he has long urged the grafting of this tree with good buds, as probably good fruit could thus be obtained. If on this hardy stock, which is very long-lived (it is said to live for 40 or 50, perhaps 70 years), a good peach could be grafted, it would be a great gain for Nevada. The experiment is certainly worth trying.

### The Mechanics' Fair.

The Pavilion is being altered and enlarged for the coming Industrial Fair, and already the body of the building has been enlarged to Geary street on one side and Post street on the other.

More space has been applied for than was occupied at the last Fair, and applications are still coming in. Any delayed till after the 15th inst. will not be allowed in competition. People in New York, Philadelphia, Chicago, and in Sacramento, San Jose, Stockton and other cities, have made application and will have goods on exhibition. The next steamers from Japan and Australia will also bring articles for the Fair. It will open on the 12th of August, and promises to excel all other exhibitions of the kind which have preceded it in California.

### FOSSIL REMAINS DISCOVERED.

While prospecting in one of the deep ravines formed by streams flowing from Stockton Cañon, Dr. L. G. Yates and Dr. Charles Allen, of Centerville, discovered the fossil remains of a mastodon. Its measurement is as follows: From front of jaw to the back of last molar teeth, twenty-four inches; width of jaw at angles, 18 inches; width of jaw midway between front and rear, 15 inches; depth of jaw from the crown of molar teeth, 9 inches; thickness of jaw, 6 inches. This specimen exhibits, in a marked degree, the peculiar process of shedding and replacement of the molar teeth. In the mastodon, all the grinders succeed like true molars, horizontally, from behind forward. In the jaw here mentioned, a part of one set of teeth have just been shed, another set are in place, and another set developed in the jaw, ready to replace others when shed. The jaw is one of the finest ever discovered in California.—*Bulletin*.

REMARKABLE FLOOD.—Papers from the Cape of Good Hope give accounts of a remarkable and sudden flood which has occurred at Victoria West. It is supposed to have been caused by the bursting of a water spout. In the space of two hours thirty houses were washed away and one hundred lives lost.

A ROYAL PRINTER.—The Emperor of Germany spent three years at the case.

**New Publications.**

**HORSE TRAINING MADE EASY.**—A New and Practical System of Teaching and Educating the Horse. Beautifully illustrated with 44 engravings. Whip Training. By Robert Jennings. To which is appended an Essay on Shoeing; also the Symptoms and Treatment of the Diseases of the Horse. Philadelphia: John E. Potter & Co.

The art of training horses has, until the last few years, been attended with much cruelty and bad management. The Rarey system gave a new impulse to the minds of horsemen, but this is here objected to as a system of subjugation and exhaustion, often resulting in breaking the spirit of the animal. But the method here proposed is one of education, teaching the horse what is required of him, but not trying to force him to do that which he does not comprehend.

The system of training a horse to drive without bridle, bit or reins, guided simply by motions of the whip, is original, and has been highly endorsed by several societies.

The important matter of shoeing horses, so open to error, is carefully treated in a most intelligent manner; and the directions concerning diseases, and the full history of *Glanders*, will be found most instructive.

**THE HORSE AND HIS DISEASES.**—By Robert Jennings, V. S. To which are added Rarey's Method of Training Horses, and the Law of Warranty as applicable to the purchase and sale of the animal. Illustrated by nearly 100 engravings. Philadelphia: John E. Potter & Co.

**DISEASES OF THE AMERICAN HORSE,** and Cattle and Sheep. Their Treatment, with a list and full description of the medicines employed. By Robert McClure, M. D., V. S. With numerous illustrations. Philadelphia: John E. Potter & Co.

The subjects of which these two volumes treat, have been discussed in many a publication. But old methods are continually going into disuse and a new era of more humane and judicious medical treatment is dawning upon us. New light is being thrown upon the diseases of the horse, and consequently much progress is being made in the treatment thereof.

The first of these two works is the more general in its scope, embracing the history of the horse, breeding and management, method of training, vices and diseases. The second confines itself closely to the diseases, treatment, and description of the medicines; so that they supplement one another. The authors are eminent authorities, and their works are calculated to occupy an important place in the libraries of those who own the noble animal. The latter volume treats also of diseases of cattle and sheep, and therefore comes home to a very large number of residents on our coast.

**PATENT LAWS and Practice of Obtaining Letters Patent for Inventions in the U. S. and Foreign Countries;** including Copyright and Trade-Mark Laws. By Charles Sydney Whitman. Washington: W. H. & O. H. Morrison. 1871.

This work is the result of an endeavor to compile from various sources, some of which are not easily accessible, reliable and practical information. Although intended to convey such information to inventors, patentees, manufacturers, and others who have occasion to inform themselves particularly concerning patent matters, it will be found useful also to lawyers generally, as it sets forth the state of the law resulting from the latest decisions, and contains the exact text of the late Act of Congress, by which the entire legislation in respect to patents and copy-rights was repealed, and a more complete and carefully-drawn law substituted.

**THE AMERICAN RAILWAY OFFICIALS' MANUAL,** containing valuable information for Railway Superintendents, Master Mechanics, and Engineers. Coyne & Kelyon, Chicago. 1871.

This work contains many valuable tables, extracts from technical journals and other matter of interest for the profession, such as is needed for frequent reference.

**MECHANIC ARTS COLLEGE LECTURES.**—The lecture, last week, was a repetition of Prof. Swinton's most interesting remarks on "War Correspondents. Having given one report of the lecture, we give none to-day, although the subject is most inviting. Next week there will occur the concluding exercises of the course, when, it is to be hoped and expected, a large number will be present.

The *Colorado Miner* asserts that smelting works will be erected at an early day at or near Golden.

**LIEUT. WHEELER'S EXPEDITION.**—The *Eureka Sentinel*, of June 15th, says: Some days past Lieut. Wheeler's party has been camped above here. The Lieut. came into town on Saturday last, and has moved the whole command south, on the road to Belmont, where he will be met by Dr. Cochran and the party that has been staying a few days at Austin. At Belmont they will be joined by Lieut. Lockwood, of Arizona, and Lieut. Lylo, of Alaska, when they will again divide, and Lieut. Wheeler's party will go through Death Valley, and another party, under command of Lieut. Lockwood, will take another route and meet again at Independence, California. When united they will start for the Colorado. At that stream they will take boats and go up, while Major Powell is going down, and they will probably meet at some point. When his explorations of the Colorado have ceased, he will go through Arizona, and return by water to San Francisco.

**THE VALUE OF SAFETY CAGES.**—Last Monday afternoon, the Crown Point cable broke while a carload of ore was being hoisted, and just as it had reached the 1,000-foot level. The cage, being provided with McMartin's new safety gear, did not fall over three-fourths of an inch, though besides the weight of the car and ore, the weight of one thousand feet of cable had to be sustained, as when the break occurred this number of feet fell down the shaft and lodged upon the cage. Not long since a miner was ascending the Yellow Jacket shaft, supporting on the cage a long and heavy stick of timber. When half way up, the top of the stick on the cage caught in the cross timbers of the shaft, when the cable pulled out from the eye in which it was fastened to the top of the cage. Had the cage been one of the old-fashioned kind, it would have dropped hundreds of feet to the bottom; but being one of the safety pattern, it did not fall a single inch, but remained suspended midway between the top and bottom of the shaft, like the coffin of Mahomet, with the miner perched upon it in a situation more comical than dangerous.—*Territorial Enterprise, June 29th.*

**PLATINUM.**—The *Los Angeles Star* is to be held responsible for the following: A party of three persons started out in 1860, prospecting in the region of the Bitter Springs. They met with little success, but when on the point of returning, discovered what was supposed to be a silver mine. A load of the rock was shipped to Los Angeles, and was, on being assayed, proved to be platinum, worth more than gold. Many inquired whence came such riches, none would answer the question; \$50,000 was offered for an interest, and refused. Two of the party, after proving their first load of rock, and while en route for their location, through some unaccountable means, took ill and died. The third dropped the matter, went to St. Louis, died there, but left his secret to a merchant, who has recently started out from Los Angeles in search of the mines. He values the discovery at a million of dollars, but platinum mines, such as this reports to be, have never been discovered.

**ROCKY MOUNTAIN COAL FOR GAS.**—The experiments made by the Gas Company in this city with the Rocky Mountain coal show that it is not yet sufficiently solid to be profitably used here in the manufacture of gas. The last lot tried, however, exhibited such a marked improvement over the first, that there can be no doubt but that when a greater depth has been attained upon the vein, the coal will be almost if not quite equal to the Scotch canal coal. The first lot of Rocky Mountain coal tried yielded 3,300 feet of gas per ton, and the last 4,600—a wonderful improvement. The yield of the Scotch coal is 7,500 feet per ton. The Gas Company are now using at their works the Scotch coal, mixed with pitch pine wood. When the Rocky Mountain coal has acquired such a degree of solidity as not to slake or crack open upon long exposure to the air, it is thought that it may then take the place of the Scotch coal, as, if not quite so good, it will cost less delivered in this city.—*Territorial Enterprise, June 30.*

The bamboo fibre, it is said, can be prepared so as to produce a good imitation of wool. The manufacture of Canada thistle into ropes and textile fabrics is reported to be soon attempted on a scale which will settle the practicability of the process.

**Good Health.**

**Poisonous Vegetables.**

There are many beautiful and innocent-looking forms of vegetable life to be met with in our gardens and hedges, which are yet full of deadly poison, while others, from their close resemblance to nutritious articles of food, are often partaken of by mistake, and fatal accidents are consequently of too frequent occurrence. Warnings and information upon this subject ought to form part of the instruction of every school-mistress, in order that children may learn to avoid them.

**Monk's-Hood.**

Or aconite, is a tall plant with dark green leaves and a curious hood-shaped flower, which ought never to be allowed entrance to a garden. So many deaths have occurred from the use of aconite as a medicine that it has fallen into disrepute, one drop of the tincture causing death; but it is still extensively used in homeopathic practice.

**Buttercups**

Are poisonous: they are so caustic that children's hands are sometimes inflamed by them. The poison disappears in drying, and they are harmless when mixed up with hay, and even nutritious, as their stems contain a good deal of mucilage.

**Laburnum**

Seeds are highly poisonous. Three little girls in Hertfordshire gathered and ate some of these seeds: two died that night, the third only recovered after a lingering illness.

**Night Shade.**

Half a berry of the dark purple fruit of the deadly night-shade has proved fatal.

**Belladonna**

Is also highly poisonous; strangely enough these two plants belong to the same species as the potato, and it is in the fruit, answering to the potato-apple, that the poison lies.

**Henbane.**

The roots of henbane have frequently been used in soap for parsnips. Their poison produces delirium and stupor.

**Fox-Glove,**

Though, like many other poisons, a valuable medicine in the doctor's hands, is fearfully dangerous when ignorantly used, and had better not be meddled with.

**Daffodils.**

Even the odor of daffodils and lilies is apt to cause headaches, and infants have been made very ill by swallowing little bits of the flowers, and also those of the jonquil and snow-drop.

**Laurel.**

The leaves of the common laurel are highly poisonous, and produce death in a short space of time. The taste and smell are very similar to bitter almonds, and in fact it is the same principle in each, that of prussic acid. Although a small quantity is harmless to some constitutions, others are powerfully affected.

**Yew Berries.**

The beautiful waxy berries of the yew, with their sweetish taste, are very attractive to children, and many fatal accidents have thus occurred.

**Arum.**

The wild arum, that strange-looking plant with its dark, coarse looking leaves, and its long, large greenish flower, contains a very irritating poison, which resides principally in the leaves.

**Mushrooms.**

Many accidents occur from mistakes as to the right kind of mushrooms to be gathered for use. The bright-colored ones are generally suspicious. The mushrooms proper to be used in cookery grow in the open pasture land, for those that grow near or under trees are poisonous. The eatable mushrooms first appear very small, and of a round form, on a little stalk. They grow very rapidly, and the upper part and stalk are white. As they increase in size, the under part gradually opens, and shows a fringed fur of a very fine salmon color, which continues more or less till the mushroom has gained some size, and then turns to a dark brown. These marks should be attended to, and likewise whether the skin can be easily parted from the edge and middle, and whether they have a pleasant smell. Those which are poisonous have a yellow skin, and the under part has not the clear flesh-color of the real mushroom; besides which, they smell rank and disagreeable, and the fur is white or yellow.

A French physician maintains that all mushrooms may be used as food, provided those that are reckoned poisonous are cut in pieces and washed in nitric acid and

water, or, when this cannot be had, in strong brine. When thus prepared, he allowed his family to eat all varieties of mushrooms.

It is a useful lesson to impress upon all children and young people never to eat of any unknown plant or fruit unless they receive express permission to do so from those who are competent judges.

**POISONOUS CARDS.**—A letter from Bavaria to the *American Journal of Pharmacy* mentions the introduction into the German states of a visiting card, which, because of its resemblance to "mother of pearl" has been greatly admired. After being tested by a medical professor, it has been found a soluble salt of lead, a very poisonous substance. The public not being acquainted with the poisonous properties of these cards, will not be on their guard in preventing their being chewed or eaten by small children, to whom the sweet taste (of the lead salt) and the crystallized appearance will form an attraction, thereby producing obscure cases of illness and poisoning. The inventors of such deleterious articles deserve, if not punishment, public censure for thus placing the health of human beings in jeopardy.

**CURE FOR A COLD IN THE HEAD.**—Dr. Pailon, of France, announces what he considers a new method of curing a cold in the head. It consists in inhaling through the nose the emanations of ammonia contained in a smelling-bottle. If the sense of smell is completely obliterated, the bottle should be kept under the nose until the pungency of the volatile alkali is felt. The bottle is then removed, but only to be reapplied after a minute; the second application, however, should be long, that the patient may bear it. This easy operation being repeated seven or eight times in the course of five minutes, but always very rapidly, except the first time, the nostrils become free, the sense of smell is restored, and the secretion of the irritating mucus is stopped. This remedy is said to be peculiarly advantageous to singers.

**A HEALTHFUL SUBSTITUTE FOR TEA.**—As a healthful drink, in place of tea, Dr. Thompson, in a late work of his, recommends the use of the dried leaves of the red raspberry. They cleanse the system of cancer, and thus act beneficially to the health. The leaves should be gathered on a warm day, and may be spread in a good airy chamber, on clean boards or papers, to dry. When sufficiently dry, they may be kept in sacks. A small handful is sufficient for several persons. This tea does not require the addition of milk or sugar, and is quite as pleasant as other tea, and much cheaper and healthier.

**A USEFUL REMEDY.**—A correspondent of the *Country Gentleman* says that tincture of arnica will cure oak poisoning, rapidly and completely, and that there is nothing better for healing wounds, bruises and sprains in man or beast. It will instantly stop the pain from the sting of a bee or wasp. For wounds it should be diluted with water. To make it, get two ounces of arnica flowers from a druggist, and put in a bottle with one quart of alcohol.

**ONLY APPARENT DEATH.**—An English paper states that the child of a tobaccoist named Lee, keeping a shop in Brownlow-hill, Liverpool, was taken ill of small-pox, and after a short illness apparently died. The body was laid out, and after the lapse of three days was placed in the coffin, when, to the surprise of all around, it uttered a cry and awoke from what appeared to be a mere lethargy. The recovery, however, was not final, for in a few days afterward the child actually died.

**TOMATOES AND HEALTH.**—A correspondent calls our attention to the attack recently made by a well-known writer on the use of tomatoes as an article of food, and asks our opinion. We answer: The writer gives no facts in support of his opinion. On the contrary, the experience of the public has thoroughly tested and proved their value. Don't eschew tomatoes.—*Home and Health.*

**WHY LADIES ARE SELDOM BALD-HEADED.** The ladies notwithstanding they wear long hair, (which is more likely to fall out,) seldom are bald-headed. Their heads are not kept closely covered. In sleeping, do not cover the head with a night-cap. Keep the head well ventilated; if the hat is close, raise it often and let in the fresh air; never wear the hat indoors.

Hall's *Journal of Health* says a sixpenny sandwich, eaten leisurely in the cars, is better for you than a dollar dinner bolted at a station.

## Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, July 12, 1871. Legal Tenders buying, 89½; selling, 90. Gold in New York to-day 112½.

## Table of Contents.

Vedder's Car Coupling, Ill.; Strongest Building Timber; Mining Suit; California Instruments for Canada Pacific Railroad.....	17
MECHANICAL PROGRESS.—Steam on Canals; Putting up Fences by Machinery; Iron Bridges; American Telescopes; Cost of Pig and Bar Iron; Cement; Strength of Iron, &c.	18
SCIENTIFIC PROGRESS.—Tyndall on Sound; Utilizing Cotton Seed; Gas Tree; Telegraph Novelty; Herschel's Character; Spheroidal State.....	18
Ageing Wine; Water Pipes; Circular Instructions; Letter to the Secretary of the Treasury; New England Earthquakes.....	19
MINING SUMMARY; Mining Shareholders' Directory; Mining Stocks; Market Rates.....	20-21
List of Patents; Notices of Patents; Editorial Notes Eastward, Ill.; Wonderful Cavern; Wild Peach of Nevada; Fossil Remains.....	22
New Publications; Wheeler's Expedition; Safety Cages; Platinum; Rocky Mountain Coal for Gas; Good Health.....	23
Notices to Correspondents: Wilder's Pony Engine; Ore Shipments; Yield of Placers; Improvement in Smelting Furnaces; New Amalgamating Agent; Unique Mining Enterprise.....	24
Flour Packing Machine, Ill.; Henry Carey Baird, Ill.; Krupp's Cannon, Ill.; Colorado at the Fair.....	25
Art of Making Pudding; Good and Diseased Meat; Oiling Floors.....	26

## Notices to Correspondents.

W. L. M.—Oakland. Your idea is a good one and will be valuable if you can overcome one obstacle to its practical working, namely, its liability to get clogged up with dirt. As your drawing shows the device, the spring would soon be out of working order by the accumulation of dirt. If you can obviate this trouble, the invention will be worth patenting.

## Wilder's Pony Engine.

We saw at the Miners' Foundry, last week, a pony engine which has been built there, after Wilder's Patent, for the San José and Santa Clara Railroad. The managers of this road, finding difficulty at times when excursion parties pass over their road in providing the necessary number of horses for drawing the cars, have determined to call steam to their aid, and this engine has been built for them.

In this locomotive, the steam passes from the cylinder into an expansion chamber and thence through a coil of pipe over the fire place, where the steam is exposed to a great heat, and thence escapes without noise or appearance which would frighten animals along the road. This is one item which will interest people in the vicinity. The engine is strongly and compactly built, has 5-inch cylinder and 10-inch stroke, and is capable of drawing with ease three loaded cars. The vertical boiler has 168 one-inch tubes, with circulation pipes to prevent foaming. The blow-off also leads into the expansion chamber noted above.

This engine has been introduced into New York city, where it is now used with great success; and we think that there is great opportunity for it in this city and elsewhere on the coast. Mr. W. G. Miller is the General Agent for the Pacific Coast, and we recommend his engine to the attention of our readers.

## Ore Shipments.

The shipments of ore to this city during the last six months have been somewhat larger than they were during the first half of last year, but not equal to one-half of what they were during last half of 1870. This is due in great measure to the erection of smelting furnaces in the interior, which reduce the ores to base bullion, and has also been influenced by the rise in the freight tariff on the transcontinental railroad.

The amount of bullion received, however, is over six times that of the first half of 1870, and about twice as large as that of the last half. It is, moreover, more than twice the amount of ore received. We have noticed, however, one fact of late in this connection, which is a little remarkable. The Eureka Consolidated have made a large shipment to the East, via San Francisco and Panama. It is said that the better prices paid at the East, and the cheaper cost of freight, renders this profitable to them. But it seems to us that such a state of affairs cannot continue long.

San Francisco certainly ought to be able to induce the interior to ship to this point. We believe that she can do so. We shall soon have competition in smelting and refining here, and then we believe that we shall receive all the bullion and much of the ore from our Pacific Slope, as we now get a large share.

We give below the amounts of ore and bullion received here during the three last half-years. The tables are most interesting for comparison and reference.

	ORE.		BULLION.	
	Interior.	South.	Interior.	South.
1870.	tons.	lbs.	tons.	lbs.
January.....	169	1,660	4	400
February.....	109	920	.....	46
March.....	119	320	19	200
April.....	219	300	22	700
May.....	308	320	40	1,400
June.....	268	1,390	20	300
	1,194	240	108	1,000
	1,300 tons	1,240 lbs.	662 tons	600 lbs.

Average per month: Ore, 216 tons, 1,540 lbs.; Bullion, 92 tons, 100 lbs.

	ORE.		BULLION.	
	Interior.	South.	Interior.	South.
1870.	tons.	lbs.	tons.	lbs.
July.....	623	1,960	4	100
August.....	671	180	64	1,400
September.....	315	110	18	700
October.....	737	700	8	300
November.....	760	900	48	1,500
December.....	382	600	2	600
	3,343	360	141	500
	3,494 tons	360 lbs.	1,563 tons	100 lbs.

Average per month: Ore, 680 tons, 1,476 lbs.; Bullion, 308 tons, 1,683 lbs.

	ORE.		BULLION.	
	Interior.	South.	Interior.	South.
1871.	tons.	lbs.	tons.	lbs.
January.....	226	900	1	1,000
February.....	168	900	.....	360
March.....	256	1,000	19	1,000
April.....	200	200	272	.....
May.....	292	800	143	600
June.....	25	1,700	2	1,500
	1,166	5,000	439	100
	1,605 tons	1,600 lbs.	3,578 tons.	

Average per month: Ore, 267 tons, 1,266½ lbs.; Bullion, 69½ tons.

The above includes 680 3-5 tons of copper ore.

The amount of ores exported from San Francisco during the same time, according to the custom house returns published in the city papers, is as follows:

1870, Jan.—June.....	839 tons	\$45,826
Copper Ores.....	567 "	90,397
Various.....	97 "	13,367
Total.....	1,503 tons	\$149,680
1870, July—December.....	1,500 tons	\$69,391
Copper Ores.....	1,061 "	247,528
Gold Ores.....	1 "	1,500
Various.....	1,219 "	64,623
Total.....	3,781 tons	\$382,942
Of the exports of 1870, 1,282 tons were shipped to New York and 4,002 tons to Great Britain.		
1871, Jan.—June.....	626 tons	\$31,694
Copper Ores.....	328 "	128,466
Various.....	214 "	48,874
Total.....	1,168 tons	\$208,934
Of these, 176 tons were shipped to New York and 992 tons to Great Britain.		

If the above figures are correct, the amount of ore smelted in this city is not very large. It should be remarked, however, that the ores called "various," which include "chrome ores," etc., are not included in the tables of imports. We commend the above statistics to the consideration of our readers.

## Yield of Placers.

It would appear that heretofore the yield of the placer dirt, at least in several localities in our State, has been generally over-estimated. An example of this is with regard to the placers of Gold Run District. The *Eng. and Min. Jour.* lately had a communication with regard to an interesting calculation of the average yield per cubic yard of the dirt washed in this district, made by W. H. Pettie of the California State Geological Survey. The superficial area here, from the C. P. Railroad south-erly to the place where the deposit has been broken off by the cañon of the North Fork, is estimated at 860 acres, of which about one-half has been worked over—not worked out, as the bed-rock has been reached only at the southern extremity, in the ground of the Cement Mining Company. It is estimated that 43,000,000 cubic yards of dirt have been removed by hydraulic process, and the gross product of the district, calculated from statistics furnished principally by Messrs. Moore & Miner, is given as about \$2,000,000. The average yield, therefore, has not been over 4½ cents, and yet hydraulic mining has been carried on with large profit.

This calculation, however, embraces only the product of the surface-dirt, as there are still from one hundred to two hundred feet of gravel and cement underlying the excavation. As the richest dirt is generally found near the bed-rock, future yields will probably bring up this average considerably higher. Several estimates have been made of the average yield of the claims between the Middle and South Yuba. Our readers will remember Laur's estimates of about 16 cents, and Silliman's of about 30 cents per cubic yard (in Ross Browne's Report, 1868) for this last region. We may say in addition that we believe Mr. Pettie's calculations to have been as carefully made as any others, probably more carefully than any before.

## Improvement in Smelting Furnaces.

There is no establishment in the world, probably, where there is a better and more efficient set of officers, and where greater improvements are made, than at the smelting works of Freiberg, Saxony. Within the past ten years great advances have been made there in metallurgy, and experiments are being continually carried on.

A Freiberg improvement is the Piltz smelting furnace, which we illustrated in the *SCIENTIFIC PRESS* of January 14th, 1871. A private letter to the editor speaks of a further modification of this construction, which would appear to be a most excellent feature.

There is now no inside crucible to the furnace, but the bottom is built of brick and inclines slightly to an iron spout leading into a crucible or hearth outside of the furnace. The melted mass runs out continuously into this last crucible, which is lined with fire brick, and which is tapped whenever it has become filled with the fused matter.

By this construction the furnace runs more regularly, and the formation of "sows" is prevented. The idea strikes us as very good. Our informant writes us that "the slags are purer than formerly, and they pronounce the thing eminently a success in all ways." As the slags previously were such as would be pronounced eminently pure in this country, the new device must have proved an effectual one.

ARTISTIC.—Mr. Charles Crocker, Vice-President of the Central Pacific Railroad, has recently imported two valuable tables, one of beautiful malachite, the other of Byzantine mosaic. The latter has representations of the principal buildings of Rome.

PERSONAL.—Prof. J. D. Whitney, State Geologist, arrived from New York last Monday.

## A New Amalgamating Agent.

The Australians are reported to have discovered a new agent for extracting gold, either from the raw ore, tailings or the refuse from smelting furnaces. This is called the saccharate of mercury, and is to be used in amalgamation. The compound has been patented by two gentlemen of Ballarat.

The preparation "consists of mercury triturated with sugar until an impalpable powder is formed, and the metal cannot be discerned in it except by using a powerful magnifying glass." The dry powder is mixed with the ore, tailings, etc., and is claimed "to attract and attach to itself all the gold." The usual system of amalgamation can be carried on with the use of the new preparation as an accelerator. For ores holding at least one ounce of gold to the ton, a rotary machine has been devised. "Half a pound of the saccharate, costing fifty cents, is sufficient for the treatment of a ton of ore."

These imperfect statements give no idea of the efficiency of the agent nor of the claims made for it. We are told that several tests were made of tailings which yielded certain amounts, and that "the banks, for which the test was made, have certified to the accuracy of the figures." But whether the saccharate of mercury will extract 50, 100 or 150 per cent. of the gold, we have as yet no statements. Undoubtedly we shall hear more of the matter, as we are promised a new era in the treatment of ores from the introduction of this new blue pill.

UNIQUE MINING ENTERPRISE.—The *Sacramento Reporter* says that the Great Crevice M. Co. is preparing to work a valuable gravel deposits in a deep crevice in the bed-rock at Murderer's Bar, on the North Fork of the American river, after the plan carried out at Blossom Rock. An iron pipe, 5 feet in diameter, is to be sunk to the necessary depth, possibly 100 feet, and drifts run out thence into the gravel. "By this means, the water can be kept out of the mine with comparative ease, and work carried on below the bed of the river with safety, cheapness, and doubtless great profit. \* \* \* A steam pump will be used to keep the shaft clear of water, and when the freshets commence, a tight-fitting iron cap will be placed upon the tube, so as to effectually prevent the lower part of the mine from damage during the winter months. Altogether the contrivance is very ingenious, as well as economical, and we doubt not will succeed." This item has been copied into the city and other papers. It is properly called unique. If that steam pump does not have sufficient work to pump out the American river, we shall be mistaken. We should be unwilling to take a contract for the work. Col. Von Schmidt snnk successfully in this manner into solid rock, but sinking into gravel is an entirely different matter. We have very serious doubts as to the "comparative ease," "safety, cheapness and great profit" spoken of above.

Fossil Bones.—The *Carson Register* says that portions of a monster pachyderm have been unearthed at the State Prison. The bones discovered consist of one-half of the lower jaw (containing the teeth), a horn, and petrified portions of the spinal column. The remains were found embedded in sandstone, about 45 feet below the surface. The teeth are about one-fourth of an inch thick (along the jaw bone), four inches wide (across the jaw), and five inches long. The teeth are about one-fourth of an inch apart. The surface of the teeth are agatized, and the petrified muscles of the jaw look ruby. One horn of the animal was found, and is in nearly a perfect state of preservation, being about eight inches in diameter at the base and fifteen inches long. How much of the jaw-bone was broken off by the blast which exposed it cannot be determined, but it is over two feet in length.

**Flour Packing and Weighing Machine.**

We have seen lately, at Wiester & Co.'s, on New Montgomery street, an invention designed for filling sacks or barrels with flour or any fine material, and at the same time weighing the substance into equal quantities. We give below an illustration of the machine, the operation of which may be described as follows:

The barrel or sack into which the flour is to be packed, is first placed around the lower part of the drain or cylinder, *A*, and secured in place by hooks, when a gate at the bottom of the hopper, *E*, located at *L*, is opened and held thus by a spring, not shown, while the flour is conveyed by a spiral conveyor or packer into the sack at the bottom of the cylinder. This packer is worked horizontally within the cylinder, *A*, by the bevel gear, *C*, operated by a hand crank on the shaft, *b*; or power may be attached to the pulley on the opposite extremity of the shaft. The flour, or other material to be packed, is fed in any proper manner from a convenient receptacle through the hopper, *F*. By the action of the spiral packer, the material is com-

pressed, as fast as delivered into the sack, to any reasonable degree of closeness.

The platform on which the sack is seen to rest is elevated by the pulley and weight, *D*, at the commencement of the operation, to near the bottom of the cylinder, *A*; the sack at the same time being brought up around and upon the outside of the cylinder. By this arrangement, the filling and packing commences in the bottom of the sack, and progresses gradually; the sack, with the platform on which it rests, dropping as fast as the filling goes on. This is so arranged by weights and springs, that when any desired amount of material has been placed in the sack, an automatic action closes the gate at the bottom of the hopper, and prevents the ingress of any more material. The machine can be adjusted to any desired amount, from twenty-five pounds upwards to 200 or more; the whole process of filling, packing, weighing and cutting off at the proper moment, being automatic in action, by the attendant merely turning the crank or shaft, *b*, or applying power to the pulley upon the same. The only attendance required is to place and secure the sack on the cylinder, as seen in the engraving, and to remove the same after being filled.

The invention appears to be a very useful and practical one. It is applicable to small grain, such as wheat, etc., as well as to flour and other pulverized material. It is extremely simple, light and does not appear to be particularly liable to get out of order. A working model of the machine may be seen at Wiester & Co.'s, 17 New Montgomery street (Grand Hotel), and we recommend flour packers and others to examine it.

**Henry Carey Baird.**

It will interest many of our readers to see the features of a man who has done so much towards helping on American industries, and who has for a quarter of a century occupied the position of leading publisher, in the English language, of practical treatises on scientific and mechanical topics.

The publishing firm of M. Carey & Sons was founded in 1793, and continued under different partnerships until 1849. Henry Carey Baird's connection with the house began in 1841, and at its dissolution he continued the business as sole proprietor.

HENRY CAREY BAIRD.

By means of the uncommon talents of which he is possessed, he has achieved a remarkable success, and his judgment and enterprise have made his name and publi-

some of his views on one of the leading financial topics of the day.

We have had occasion to observe the introduction on this coast of many of his works, which have been received with much satisfaction, containing as they do the live information sought for in a condensed and applicable form for our American artisans and manufacturers.

His catalogue of practical and scientific books comprises 82 octavo pages, and includes one or more treatises on nearly every industrial subject. It will be sent free of postage to any one addressing Henry Carey Baird, Industrial Publisher, 406 Walnut street, Philadelphia.

**Krupp's Breech-Loading Cannon.**

A short time ago we gave an illustrated description of the enormous steel works of

KRUPP'S BREECH-LOADING STEEL CANNON.

ous most favorably known both in our country and in other lands.

The subject of this sketch was born at Frankford, Penn., on September 10th, 1825. His education has been such that he is now admitted to be an authority in his own departments of science; and he has also attained considerable eminence as a writer. He is a frequent contributor to leading journals and magazines, and has written several pamphlets on industrial and financial questions which have exerted a wide influence.

As an author his labors have been chiefly in the field of political economy. He is a strong advocate of a protective tariff, and we have a number of his pamphlets in answer to the arguments of the free-traders. We also publish elsewhere a letter of his to the Secretary of the Treasury, which will give an insight into

Krupp at Essen. We are now able to present our readers with a view of the famous Krupp breech-loading steel cannon, which has come so largely into favor in Europe, and to the great range and penetrating power of which the recent victories of the German armies are in a great measure attributed. The engraving (for which, with the description, we are indebted to the *American Artisan*) represents also the adjuncts employed in working the gun, and the devices which, from the great weight of the shot, are found essential in the operation of loading; the shot being lifted by a carrier slung from pulleys, themselves depending from a standard attached to the carriage. This latter is termed "a low self-acting casemate carriage." The gun represented is of 11-inch bore.

The bore extends throughout the entire

length of the gun; in other words, the breech-block being suitably withdrawn, the gun is open from end to end. The breech-block is of rectangular form and works laterally within an opening of corresponding form provided transversely in the breech. When withdrawn toward the left, the breech is opened and the projectile, being slung in line with the bore, is forced forward to its place, the breech-block is moved inward across the bore, closing the same at the breech, and is there securely fastened by devices not shown in the figure. The whole arrangement is very simple, compact and strong.

The largest Krupp guns used at the siege of Paris were 24-pounders, but the accuracy of these dismounted the opposing artillery, which was composed of the largest marine guns of the French fleet.

A 15-inch Rodman gun, weighing 3,900 lbs., has a penetrating power of 26.80 feet with 60 lbs. of powder, and of 43 feet with 100 lbs. A Krupp 24-pounder, weighing only 8,000 lbs. and with only 15 lbs. of powder, has a penetrating power of 47.70 tons. A ship armed with this light weapon would, it is asserted, be more than a match for any vessel with 15-inch guns. The gun here illustrated weighs about 6,000 lbs., charge of powder,  $4\frac{1}{2}$  to  $5\frac{1}{2}$  lbs.; weight of projectile, 55 to 60 lbs.

Such is the description which has been copied into several papers. But there must be some mistake with regard to the size of the gun and the charge of powder.

**Colorado at the Fair.**

We see that a strong attempt is being made in Colorado to have that territory represented at the coming Industrial Exhibition of the Mechanics' Institute in this city. Colorado is certainly capable of making a fine show here. She has great natural resources, and her people are most active and energetic.

The agent of the PRESS at Denver, Mr. M. W. Levy, will forward anything that may be left at his place of business for the exhibition; and we hope to have a fine agricultural show. The mining districts also are moving, and we notice that the *Central City Register*, a most energetic sheet, whose progress in ability we have long marked, and which we now consider one of the very best of our interior papers, is advocating the measure. We extract the following on the subject from its columns:

We think that Colorado can make quite as good a show in the way of rich ores of gold, silver, copper, lead, etc., as any other State or Territory in the Union, and that she should not neglect this opportunity of benefitting herself by so doing. In case no one is sent from here specially in charge of the ores, Mr. Murray, of the SCIENTIFIC PRESS, has kindly volunteered to take charge of them for us, and see that they have a prominent position in the Pavilion. After the exhibition, all specimens (unless specially requested to be returned to the owners) will be placed in the mineralogical cabinet of the Mechanics' Institute, whose property they will be, and where they will always be open to public inspection. Talk alone will not carry this enterprise through, but if our miners will take a little interest in the matter, and bring in specimens of their ores as above, we can send in as good a collection as any other mining country, and show our brethren of the Pacific slope that we are alive, and not afraid to compare ores with them. We are satisfied, too, there are persons enough here who would like to take the trip, to make up a nice, pleasant excursion party, and secure half-fare rates.

LAND MATTERS.—The General Land Office has decided that Agricultural College scrip may be received in payment for pre-emption claims, but not in payment of homestead claims, and all cases where it has been received for the latter are suspended.

THE CALIFORNIA ACCLIMATIZING SOCIETY has sent to the Caledonia farm, New York, for 1,000 black haws, to be placed in San Mateo county.

THE death of Alexander K. Johnston, the noted geographer, is announced by cable dispatch. He is well known from his "National Atlas," his "Dictionary of Geography," etc. He was born in Scotland, in December, 1804.

## DOMESTIC ECONOMY.

### The Art of Making a Pudding.

For this purpose wheat flour should be sifted and accurately measured, Indian meal scalded, tapioca soaked over night, sago and rice washed in several warm waters, dried bread rolled and sifted, the whites and yolks of eggs separately beaten; do not put them into hot milk or they will curdle; add the whites the last thing. Butter is the best shortening for wheat flour; but lard, suet and churn drippings are nice for corn meal.

Scald molasses and let it cool before using. Cream of tartar and yeast powder must be sifted with the flour, soda or sal volatile dissolved in lukewarm water and strained. A large amount of soda and saleratus is required for molasses; in using it with sour milk more or less should be used according to the acidity of the milk.

Raisins should be stewed, citron sliced very thin. Zante currants mashed and thoroughly dried, and all fruits well dredged with flour and added the last thing. Beating all the ingredients thoroughly insures a light pudding.

Batter puddings and custards require straining. Whether the pudding is to be baked, boiled or steamed, the dish or mold must be well greased. Bits of butter are sometimes put over the tops of baked custards to prevent their burning. We think steamed custards preferable. For boiling, four eggs should be allowed to a quart of milk, the milk placed in a tin pail in a kettle of boiling water.

Pudding bags should be made of strong, unbleached sheeting. Just before using, dip the bag in hot water, wring out, and dredge thoroughly with flour. Allow plenty of room for the pudding to swell. Place an old plate in the bottom of the pot to keep the pudding from being burned. Keep it well under water and the water constantly boiling. When done, dip the bag in cold water and the pudding will slide out in form.

For steaming, the earthen Turk's head is very common, and if well greased before the pudding is put in there will be no difficulty in preserving the exact form. More time is required to cook a pudding in steaming than in baking or boiling.—*Household.*

### Good and Diseased Meat.

Good meat is neither of a pale pinkish color nor of a deep purple tint. The former is indicative of disease, and the latter is a sign that the animal died from natural causes. Good meat has a marbled appearance, and the fat, especially of the internal organs, is hard and suety, and is never wet, whereas that of diseased meat is soft and watery, often like jelly or sordid parchment. Again, the touch or feel of healthy meat is firm and elastic, and it hardly moistens the fingers; whereas that of diseased meat is soft and wet—in fact, it is often so wet that serum (the watery part of the blood) runs from it, and then it is technically called *wet*. Good meat has but little odor, and this is not disagreeable; whereas diseased meat smells faint and corpse-like, and it often has the odor of medicine. This is best observed by cutting it and smelling the knife, or by pouring a little warm water upon it. Good meat will bear cooking without shrinking, and without losing very much in weight; but bad meat shrivels up, and it often boils to pieces.

All these effects are due to the presence of a large proportion of serum in the meat, and to the relatively large amount of intercellular or gelatinous tissue; for the fat and true muscular substance are to a greater or less extent deficient. The use of diseased meat not only affects the human constitution, but it is also certain that tape-worm, trichina, and other parasitical diseases are produced by it. Experience also points to the fact that carbuncles and common boils are in some degree referable to the use of the flesh of animals affected with pleuro-pneumonia; and occasionally we witness the most serious diarrhoea and prostration of the vital powers after eating diseased meat. It is, therefore, safest to forbid its use.—*Good Health.*

**KEEPING CIDER SWEET.**—Thomas Johnson of East Mecca, Ohio, informs the N. Y. Farmers' Club, that his custom is to make the cider designed for drinking as late as circumstances permit. Then, after three days or so, draw it off as carefully as possible, so as not to stir up the pomace. Then strain it through a woolen cloth into other clean barrels. Then put into each

barrel a half pound of mustard, ground or unground; bung your barrels tight; keep them in as cool a place as possible so as not to freeze. He has kept it in this way as sweet as when put up, as late as June or July. Remember, when you draw your cider off, don't let in any more air than sufficient to make it run.

### Oiling Floors for Kitchens.

I have, for several years, followed the plan of oiling uncarpeted floors, in order to avoid the labor of scrubbing them, and I find it works well. You can either oil or paint them, of course, but I consider the oiling preferable, on the following grounds: It is cheaper.

You can apply it yourself.

You have not to wait for it to dry.

It produces a pleasanter color.

It doesn't show tracks of dust, mud and such like; and, therefore, a floor thus prepared does not require so frequent mopping.

An oiled floor is better than a plain one in the following particulars:

It looks better.

It does not require scrubbing; which saves your back.

It is never to be mopped in hot water nor strong suds; which saves your hands.

Grease spots never hurt it; which saves your temper.

To prepare a floor, I take a quantity of the cheapest and least offensive oil I can secure, and apply it with a common paint brush. I put it on smoothly, so that it will strike in equally all over and yet not stand in spots on the surface. I do this at night, after the evening work is finished, and find the place ready for use the next morning. Of course it would not injure the oiled surface itself to tread upon it at once; but grease is liable to be tracked from it, at first, to adjacent parts of the house. A new coat of oil applied once in six months, or even once a year sometimes, is sufficient to keep a floor in perfect order.

One may thus prepare to great advantage the floors of kitchens, pantries, and summer-dining rooms, back halls, stairways and porticos, closets, bath rooms and laborers' bedrooms. It is also a good plan in children's apartments, particularly when you are training them to do their own room work, to leave bare that end or side of the floor under the bed stands, and to oil it. That portion of the floor under the bed can then be easily kept free from dust, the sweepings can be more readily removed, and the children will be afforded free scope for their duck-like style of ablutions, without danger to the carpet.—*Western Rural.*

### Pennyroyal for Fleas.

The oil of pennyroyal will drive these insects off; but a cheaper method, where the herd flourishes, is to throw your dogs and cats into a decoction of it once a week. Mow the herb, and scatter it in beds of pigs once a month. I have seen this done for many years in succession. Where the herb cannot be got, the oil may be procured. In this case, saturate strings with it, and tie them around the necks of dogs and cats; pour a little on the back and about the ears of hogs, which you can do while they are feeding, without touching them.

By repeating this application every 12 or 15 days, the fleas will flee from your quadrupeds, to their relief and improvement, and your relief and comfort in the house. Strings saturated with the oil of pennyroyal, and tied around the necks and tails of horses, will drive off lice; the strings should be saturated once a day.—*Scientific American.*

**How to Purify Cisterns.**—If they are very foul clean them out. If not, heat half a bushel of charcoal, and when in a glow, pound it into pieces as big as hickory nuts, and shovel them with the coarsest of the dust into a wet gunny bag or other coarse sack; put in a stone big enough to sink it, and, tying a cord to it, draw it up and down through the cistern; many leaving it suspended near the top of the water one day and near the bottom the next. The results will be observed very soon, and will be permanent for several weeks, when the operation may have to be renewed.

**To Boil Meat to perfection** it should be done slowly, in plenty of water. As the water boils away add more hot water. If boiled too quickly the outside of the meat becomes tough, and, not allowing the heat to penetrate readily, the inside remains raw. Boiled meat is best for invalids.

## KNOWLES' PATENT STEAM PUMP.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.

The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.

The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous bead, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,  
SACRAMENTO, CAL., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.

Yours truly,

A. J. STEVENS, General Master Mechanic.

OFFICE OF PEOPLE'S TRANSPORTATION CO.,  
PORTLAND, OREGON, April 22, 1871.

Mr. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.

Yours respectfully,

G. MARSHALL, Chief Engineer.

MESSRS. KNOWLES & SIBLEY, New York—Gents: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.

Yours very truly,

C. P. HARM.

OFFICE OF DELAMATER IRON WORKS, NEW YORK, May 26, 1871.

MESSRS. KNOWLES & SIBLEY, 92 Liberty street—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.

Yours very truly

GEORGE M. REYNOLDS, Supt. Engineer.

MESSRS. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully,

WM. W. WOOD.

OFFICE OF THOMAS IRON WORKS, HOKENDATQUA, Pa., June 1, 1871.

MESSRS. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, to any who may have use for a first-rate Steam Pump.

Respectfully yours, etc.,

EDWIN MICKLEY, Supt. of Mines.

OFFICE OF THE SAUCON IRON CO.,  
HELLERTOWN, Northampton County, Pa., May 26, 1871.

MESSRS. KNOWLES & SIBLEY, New York—Gents: We can most cheerfully respond to your inquiry as to the qualities of the Knowles Patent Steam Pumps we have in use. We bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given VERY GREAT satisfaction, and that we like them better than any we have ever used.

Yours very respectfully,

G. W. WHITAKER, President and Superintendent.

MESSRS. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyls., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.

Yours very truly,

P. SAULT, Superintendent.

CENTRAL AND WESTERN PACIFIC AND CAL. AND OREGON RAILROADS,  
OFFICE SUPT. W. M. P. & M., SACRAMENTO, CAL., July 8, 1870.

A. L. FISH, Esq., San Francisco—Dear Sir: Your favor of the 2d inst. is received, asking my opinion in regard to the Knowles Steam Pump, and would say I have used the Knowles Steam Pump for several years, and consider them for all purposes the best steam pump in use. Yours truly, E. F. PERKINS, Supt. M. P. & M.

OFFICE OF RED BLUFF WATER WORKS, RED BLUFF, June 11, 1871.

A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction; and I take great pleasure in recommending them to be all you have claimed for them, and I will add that I think they have no equal. Yours, etc., JOHN CLEMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

## Miscellaneous.

Of a far Higher Class than any other proprietary medicine of the day stands

Tarrant's Effervescent Seltzer Aperient.

And for this reason: it is an exact counterpart of one of the most valuable medicines in the world. We refer to the great Seltzer Spring of Germany, to which thousands of the dyspeptic, the bilious, the rheumatic, and the victims of venal diseases resort annually, and return to their homes convalescent or cured. The Aperient is one of the first, and by far the most successful, of all the efforts made to reproduce, in a portable form, the popular mineral waters of Europe. SEE THAT YOU PURCHASE ONLY THE GENUINE ARTICLE.

SOLD BY ALL DRUGGISTS.

The "PAIN KILLER" may justly be styled the great medicine of the world, for there is no region of the globe into which it has not found its way, and been largely used and highly prized. Moreover, there is no climate to which it has not proved to be well adapted for the cure of a considerable variety of diseases: it is a speedy and safe remedy for burns, scalds, cuts, bruises, wounds and various other injuries, as well as for dysentery, diarrhea, and bowel complaints generally, it is admirably suited for every race of men on the face of the globe.

It is a very significant fact, that notwithstanding the long period of years that the "Pain Killer" has been before the world, it has never lost one whit of its popularity, but on the contrary, the call for it has steadily increased from its first discovery, and at no previous time has the demand for it been so great, or the quantity made been so large, as it is to-day.

Another significant fact is, that nowhere has the Pain Killer been in higher repute, or been more generally used by families and individuals, than it has been here at San Francisco, where it was first discovered and introduced. That the Pain Killer will continue to be, what we have styled it, THE GREAT MEDICINE OF THE WORLD, there cannot be the shadow of a doubt.—Providence Advertiser.

## The California Powder Works

No. 314 CALIFORNIA STREET.

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,  
MINING,  
And BLASTING  
POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE  
MILLS. It being constantly received and transported  
into the interior, is delivered to the consumer within a  
few days of the time of its manufacture, and is in every  
way superior to any other Powder in Market.  
We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives  
now in use, and the lifting force of the BEST BLASTING  
POWDER, thus making it vastly superior to any other  
compound now in use.

A circular containing a full description of this Powder  
can be obtained on application to our Office.  
16v20-3m JOHN F. LOHSE, Secretary.

## Manganese! Manganese!

We have on hand the Best and Purest

Office, 520 Montgomery street, over Sather &amp; Co's Bank, San Francisco, Cal. July 15-2d

## PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,

### ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

W. H. GORRILL, President.

## Ophir Copper, Silver and Gold Mining Company—Location of

works, Ophir, Placer County, California.  
 Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 30th day of May, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

EXCELSIOR IMPROVED DOUBLE-ACTING SUCTION AND FORCE PUMP.  
HOOKER'S PATENT, August 13, 1865, and January 15, 1867.

We call the especial attention of all Millwrights, Miners and Farmers to this very superior Force Pump. It is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and warranted to furnish more water than any other pump of equal caliber. It has Poppet Valve, which can not be wrongly placed in the Pump. The Fair of the Mechanics' Institute, held in the city of San Francisco, awarded the owners of this Pump, for its SUPERIORITY, A FIRST PREMIUM AND SILVER MEDAL. Suitable for DEEP WELLS, Factories, Mining, Breweries, Sugar Refineries, Tanneries, Railroad Purposes, Drainage, Irrigation, etc. As the above Pumps are already in use in the principal Sugar Refineries, Factories, Rolling Mills and Gardens in this city, reference may be had where they are working. See circular (11).

General Agents.—MESSRS. BRITTAN, HOLBROOK & CO., 111 and 113 California street, and 17 and 19 Davis street, are Agents for the sale of the Excelsior Pump, who make liberal discount to the trade. H. J. BOOTH & CO., Union Iron Works, First Street, corner of Mission, San Francisco, who manufacture and have the sale of the Excelsior Pump. V. CUSHING, Proprietor, San Francisco.

We have BRASS-LINED, BRASS PISTON and BRASS VALVE PUMPS, at greatly reduced prices. Also STEAM PUMPS.

BOONE'S C-SPRING ROLLER SKATE.

PATENT GRANTED.

This SKATE surpasses in Elasticity, Durability and Ease of Operation, any other Skate in existence. Its superiority has been proved wherever it has come in competition with any other Roller Skate.

FOR DESCRIPTION SEND FOR DESCRIPTIVE CIRCULAR.

Warranted to run longer without requiring to be repaired than any other Skate.

Owners of Rinks will find it the most profitable as well as the most satisfactory to their patrons. The patentees guarantee the right to run this Skate to purchasers of rights for the full term of the patent, and

Warrant it to be no Infringement on any Existing Patent.

State, County, Town and Rink Rights for sale at reasonable terms.

Apply by letter or in person to

## Machinery.

### STEAM JET PUMP.

Black & Williams' Patent.—For Water, Oils, Acids, Etc.

The best COLD WATER PUMP for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit.—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded. Send for Circular. PARKER & HUNT, Southeast cor. Tenth & K Streets, Sacramento City Cal. Agents—Gus. F. Brock, 117 California st., San Francisco; KEEF & BARDON, Stockton. Can be seen at McAFEE, SPIERS & Co's. Boiler Works, S. F. 21v21-21

## WHY THE WILSON

### Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the townships, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbly," but call and investigate its merits. One can always be seen at the Pacific Iron Works. Ten of these Mills are now in operation. For further particulars address

FURMAN R. WILSON,  
San Francisco.

### THE PATENT Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired. For further information apply to R. STONE, 25v22-3m 422 Battery street, San Francisco.

## STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20-1mr,lmrft

## BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast, as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility having no cams, nor complex rotary arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no dead points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used on Railroads and Steamboats; in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Pump on Exhibition. The agents have recently imported several of the largest sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them; we claim for it that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by BERRY & PLACE, Machinery Depot, 112 and 114 California st., San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

## GARRATT'S CONDENSING LUBRICATOR.

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION.—D is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted siphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the operation of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C.

STURTEVANT'S  
PRESSURE  
BLOWER.  
Are for sale by  
Berry & Place,  
112 California st.,  
San Francisco,  
who have the different sizes always in store. 4v22

## Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated. Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed. Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

## TRAVIS & WAGNER!

AGENTS FOR  
Dufour & Co's.,  
Celebrated Dutch Anchor Brand Bolt-String Cloth; Smt Machines; Mill Picks; Mill Picks dressed; Mill stones required rebuilt and balanced. MANUFACTURERS OF French Burr Mill Stones, Portable Mills of all sizes, from 16 to 31 inches, for grinding Corn, Barley, Feed, Salt, Paine, Drugs, &c. Mills specially adapted for Salting Quartz. 41 First st., San Francisco.

## HIBBERD, SANBORN & CO.

South Point Mills, Berry Street, Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners Billiard Balls and Ten Pins. Fancy Newels and Balusters. 21v22-6m.

## THE SCIENTIFIC PRESS. U. S. & FOREIGN PATENT AGENCY,

ESTABLISHED IN 1860,  
Is now the principal office West of the Mississippi River  
By long and faithful attention

Messrs. Dewey & Co.,

Have built up an extensive business, and gained a large  
and successful practice and experience, which enables  
them to render greatly superior service to

### Pacific States Inventors,

who can depend upon their advice regarding the patent-  
ability and worth of their inventions, the correct draw-  
ing up of their specifications in order to secure their full  
rights under firm patents which will stand the test of  
law in case of infringement by others.

Inventors securing really valuable claims through our  
Agency, will have our influence free in making the mer-  
its of their patents widely known through the columns  
of the PRESS—the best authority and medium of recom-  
mendation in such matters on this coast.

If you have a valuable invention place it only in the  
hands of first class, responsible agents, who do not, for  
the want of experience or ability, assume false airs of su-  
periority and dignity, nor exact exorbitant charges on  
account of transacting a limited business.

### Circulars of Advice Free.

Our 48 page circular will be furnished free on applica-  
tion. It contains extracts of the Patent Law, 112 il-  
lustrated mechanical movements; hints to inventors,  
and much other desirable information concerning the  
obtaining of patents, etc., for inventors and patentees.

Our FOREIGN PATENT CIRCULAR (free) gives informa-  
tion concerning the requirements of Foreign Govern-  
ments regarding the granting and working of patents.  
The SCIENTIFIC PRESS and the PACIFIC RURAL PRESS,  
both first class 16 page papers, are published at \$4 per  
annum each, by

DEWEY & CO.,

Patent Agents, Engravers and Publishers, No. 414, Clay  
st., San Francisco.

### ACTIVE MEN!

With Experience in Canvass-  
ing business, can now obtain lucrative and permanent  
employment by DEWEY & CO., Patent Agents and Pub-  
lishers of the SCIENTIFIC PRESS and the PACIFIC  
RURAL PRESS, No. 414 Clay street, S. F.

## Eighth Industrial Exhibition

—OF THE—

### MECHANICS' INSTITUTE

WILL BE OPEN TO THE PUBLIC  
AT 11 A. M. TUESDAY, AUGUST 8, 1871,  
With the usual Ceremonies.

### HON. MILTON S. LATHAM

Has consented to deliver the OPENING ADDRESS.

The EXHIBITION BUILDING is situated on

### Union Square,

In the heart of the city of San Francisco, and on the  
line of three street railroads. The building covers a  
ground area of 95,200 feet, and is complete in all its  
appointments.

Steam power and water supply furnished free to  
exhibitors.

All goods competing for premiums, or to be cata-  
logued, must be received by the entry clerk before  
August 12th.

Rules and Regulations can be obtained from any of  
the officers at the Institute or Pavilion.

In conjunction with the Industrial Exhibition, the  
BAY DISTRICT HORTICULTURAL SOCIETY will  
hold its first Exhibition of the Fruits and Flowers of  
California, occupying a space of 32x50 feet.

### PRICES OF ADMISSION:

Season Tickets admitting gentlemen and one lady \$5 00  
Season Tickets admitting one person..... 3 00  
Season Tickets admitting juveniles under 14 years. 1 50

The above Tickets are not Transferable.

Single Admission ..... 50 cts.

## Double-Acting Plunger Pump.

The expenses of mining have steadily increased from year to year with increasing depth of mines and the larger amount of machinery made necessary by this and various other causes well known among our practical men. Everything therefore tending to lessen these expenses is of interest to our miners and is eagerly investigated by them. As the miners go deeper there comes the want of a reliable pump, one that shall work with economy, and at the same time entail the least cost for repairs. Our attention has recently been called to this subject by an article in the *Eng. and Min. Journal*. At the first opportunity we examined the pump personally, and by careful inquiry satisfied ourselves as to the truth of the statements.

"A steam pump for mining purposes must fulfil so many different requirements, that those of ordinary modes of construction, though performing admirably above ground are of little use. The water to be lifted varies greatly in character. In some cases so large a proportion of sand is present that great heaps accumulate at the outlet. Mine waters often contain acids which quickly destroy the iron in contact with them. The pump which we illustrate this week, owes its very peculiar form to the fact that it was designed for a mining pump that should fulfil all the requirements made upon it.

"The displacement or plunger system was adopted because it is the only one which allows all leakages to be made external. To do this, however, and make the pump double-acting, it was cut into two parts and the ends separated by means of a fixed stuffing box. In other words, there are two single-acting pump cylinders, with one plunger between them. This allows easy access to the stuffing-boxes upon their inner ends, and brings all leaks to the outside, where they can be seen. At the same time the loosening of a few nuts holding the followers in place allows easy access to the main packing-box, which, if necessary, may be repacked in a few minutes. Fibrous packing is generally used in the place of metallic, on account of the ease with which it is replaced, and the small wear occasioned by sand, dirt, etc. The plunger has a clearance in the cylinder, so that sand and gravel will not wear either plunger or cylinder itself.

"Each end of the single cylinder has its own valve-chest. These valves have an opening area equal to that of the plunger. The valves are separated from the cylinder by a little more than the thickness of the walls, thus reducing the length of the pass-

ages to the minimum. The chests are connected by pipes of large size (the internal diameter being equal to the diameter of plunger), upon one of which the air chamber is situated. The position of the air chamber is optional, as it may be placed at the end of either valve chest, as the case may require. The position of the discharge pipe may be varied in the same way, as well as the section, which is no small advantage where room is limited. Upon the top of the valve-chests hand-plates are arranged, so that easy access may be had to the valves, and that without the use of any tools whatever, simply by unscrewing the hand-lever nuts. The valves themselves are seated upon oak-tanned leather. The hinges are of metal.

"The main valve is a plain, flat, slide valve, of the "B" pattern, and above this, in a separate cylinder, is the auxiliary or

a little, the pump began to work, and continued to do so until the mine was clear. In another case, instead of floating the pump upon a raft, and allowing it to pump out a shaft, flexible connections were made, and the pump lowered to the bottom. This was in a coal mine, where fuel was of no account compared with time and labor.

"In case of wear or accidental breakage of any part of a pump, an order by telegraph or mail will bring a new part by first express, as all the parts are made to interchange and fit, that but little time need ever be lost by a break down."

This pump is manufactured by Messrs. Knowles & Sibley, 90 and 92 Liberty street, New York City. Their agent for this coast is Mr. A. L. Fish, No. 9 First street, San Francisco, who is ready to supply this or any other pattern from the same manufacturers. They have also a large pump

## The New Alloy of Copper and Iron

We have been asked with regard to an alloy of copper and iron said to have been discovered by a gentleman of this city. The inventor is Dr. Siegfried Meyer, who has been a practising physician and has devoted considerable time to the production of such a composition. We have seen the doctor, who gives us the following in regard to the matter:

The alloy is composed of copper and iron, united in certain proportions to form a substance which can be tempered to a hardness greater than that of steel, and can be easily worked. It can be used with great advantage for such articles as shoes and dies of stamp mills, for instance, and on account of its great hardness will outlast by a very considerable length of time those now made of chilled cast iron, while they can be manufactured just as cheaply. Moreover, the alloy is of such a nature that it is not liable to oxidation on exposure to the atmosphere. The principal object of the invention is, however, to make a malleable metal which can be tempered to the utmost hardness, and which therefore can replace steel in many of its applications, while being much cheaper. The mode of manufacture constitutes the doctor's secret.

In order to be able to do what he desires on a large scale, the doctor desires to dispose of an interest in his rights. Any letters may be addressed to Dr. Siegfried Meyer, San Francisco; or any addressed to the care of this office will perhaps be more certain of arriving at their destination. The doctor has left us a sample of his alloy, which can be examined here by any interested in the matter.

**CHLORINATION WORKS IN SISKIYOU.**—Mr. Deetkin, formerly of Grass Valley, says the *Yreka Union*, has been erecting chlorination works for the Black Bear Mill on Salmon River. These are now complete and reduce from three to four tons daily. The sulphurets yielded on first trials, \$65.40 to the ton. A large amount is on hand, the accumulation of years.

**MILL SUPPLIES.**—We know, from good authority, that Messrs. Travis and Wagner, 41 First street, are good workmen, and we commend them to our readers. They do a large business in manufacturing, repairing and rebuilding mill stones; have some very good portable mills, of different sizes, for grinding feed, paints, drugs, etc.; are agents for Dufour's bolting cloths, which have a high reputation; manufacture and dress mill picks in the best style; and provide all sorts of mill furniture.

DOUBLE-ACTING PLUNGER PUMP FOR MINING PURPOSES.

driving valve which drives the main side valve. The arm upon the main piston rod merely opens the steam connection with the small steam cylinder. This makes its stroke and moves the main valve. This motion is positive, and will work, even though under a head of water instead of steam, with cylinder and passages also filled with water. There is no danger of the motion injuring itself, as it is cushioned by steam at each end of the cylinder, and remains quiet through the whole length of the stroke until the moment for changing the valve. This positive motion is of great value, as a case in point will show. We are informed that, by a sudden flood, a mine containing one of these pumps was drowned out, and the pump submerged to a depth of 86 feet. It was at first proposed to grapple for the pump (at the bottom of a shaft) and hoist it up, breaking the connections, when it was suggested, that it would be well to turn on steam and see whether it would work. After some little discussion steam at 80 pounds to the inch was turned on. After

for a coal mine, of ordinary manufacture, except that, as the waters contain considerable corrosive matter, all the parts coming in contact with these are made of bronze or gun-metal.

**EIGHTH INDUSTRIAL EXHIBITION.**—As there seems to be some confusion as to the date before which applications must be made for space at the coming Industrial Exhibition of the Mechanics' Institute, and the date before which articles for exhibition must be sent, we give the following: The latest date on which applications for space will be received has been extended to July 25th, and the latest date on which articles for exhibition will be received is August 12th. The Fair will commence on August 8th, and continue four weeks. In answer to an invitation sent to President Grant to be present at the opening exercises, a reply has been received to the effect that the President, although unable to come on in time for the opening, will be at the Exhibition about the middle of August.

## MECHANICAL PROGRESS.

**NEW GALVANIC GAS LIGHTER.**—Prof. Klinkerfuss, of Göttingen, has invented an apparatus for igniting gas and other lights. As regards gas lights, we condense from the *Sci. Am.* Each lamp-post has its own galvanic apparatus, and the galvanic pair touches the liquid only during the short space of lighting up. An hermetically closed vessel is provided with a compartment or bell, open at the bottom, so as to communicate with the main vessel, and having a galvanic pair of zinc and graphite fixed to the cover in such a manner that the solution of bichromate of potassa and sulphuric acid, in the lower part of the vessel, is not reached by them when the apparatus is in its usual inactive state. A pipe leading to the burner of gas flame, passes, air proof, through the cover of the vessel and is immersed in the liquid, thus shutting off the outer air from communication with the upper part. The latter is filled, above the above named liquid, with illuminating gas supplied from the gas works, and as the pipe which passes through the cover is of sufficient length to hold the hydrostatic column raised by the small and nearly constant pressure usual in gas pipes, it takes the place of the last stop cock in the supply pipe. By another pipe leading to the bell from a station at any required distance, the air in the upper part of the bell can be rarefied, and thus the liquid in the hermetically closed vessel can be sucked up, lowering the surface so that the escape of the gas through the pipe leading to the burner is first opened, and then, on continued suction, the zinc and graphite plates are reached by the liquid. At this point the galvanic circle is closed, and the platinum wire over the mouth of the pipe leading to the burner becomes heated, and acquires sufficient catalytic power to kindle to a flame the hydrogen contained in the gas jet. After this is effected, a slight remission of the sucking power in the pipe is made to sink the level below the galvanic plates, in order to avoid unnecessary exposure, but without shutting off the escape of the gas. In order to make sure of this effect on all the lamps, a model apparatus must be placed at the station, corresponding in all respects to those of the lamps. The putting out of the light is effected by opening the sucking pipe to the access of atmospheric air, thus restoring the previous state of equilibrium, and, at the same, preventing differences of temperature in different parts of the sucking pipes to cause partial suckings, and thus stop the correspondence in the working of the apparatus on the different lamps. This apparatus may be attached to any ordinary gas pipe, and is easily removed, when required, for the purpose of a revision.

**IRON PAPER.**—THE THINNEST YET.—The *London Mining Journal* records the production of the thinnest sheet of iron ever yet seen, and records the history of similar sheets. We condense. In 1851 a Pittsburgh (Pa.) firm produced a sheet with a surface of 44 in., weighing 69 grains, and 1-1800th of an inch thick. A Welsh firm next made one of the same surface weighing only 46 grains. Staffordshire, England, produced still thinner sheets, which, reduced to the same standard would weigh only 33 and 31 grains respectively. After these came sheets which would weigh reduced to the standard of a surface of 44 inches 23½ and 23 grains respectively. But the Upper Forest Tin Works, near Swansea, have capped the climax. They have produced a sheet, 10x5½ inches, weighing 20 grains, which is but 16 grains for 44 surface inches, and it requires 4,800 placed side by side, to make 1 inch in thickness. This stands on record as the thinnest sheet of iron ever rolled. The thinnest sheet of tissue paper to be purchased measures the 1200th part of an inch; is 4 times as thick as this.

**NEEDLE MAKING.**—The latest invention of importance in the needle trade is a pointing machine, of English origin. A grooved grindstone, revolving at great speed, grinds the end of each wire into the desired shape. To this grindstone the wires are applied from an inclined plane, on which a number are placed cut to the length required. By means of a disc, surrounded with caoutchouc, revolving slowly in a direction transverse to the grindstone, a continuous supply of wires rapidly revolving in succession is supplied to the stone, and the same disc causes the wire to revolve while being pointed. Redditch,

in Worcestershire, England, employs 8,000 people in making needles, and is the trade center of Great Britain. The principal seat of industry on the continent is Aix-la-Chapelle, hut at Lyons, and one or two towns in Normandy, the common qualities are largely made. The Chinese supply their own requirements, and it is thought that the craft is more ancient in the Celestial Empire than in Europe. Certain it is, that round-eyed needles were made in China long before the primitive square-eyed ones were known in England.—*Mechanics' Magazine.*

**NEW TRANSIT INSTRUMENT.**—A new transit, Heller & Brightley's, is described in the *Proceedings of the Amer. Philosophical Society*. It is a "long center" transit, with plates ribbed, so as to get equal strength with less weight, which detaches as easily as the "short center," but keeps all the centers covered and not removable from the instrument, and leaves the tripod-head and legs with the four levelling-screws, etc., to be carried by the assistant. It is steadier than, and weighs one-half as much as, the ordinary long center. It has an improved tangent screw, which will never get "lost motion" by wear. This is effected by means of a long cylinder nut, from whose interior ¼ of the screw has been removed; into half the recess thus left in the nut is fitted a cylindrical follower, with the same length of screw-thread as the nut, fitted with a key that allows longitudinal motion but prevents it turning in the recess. In the remaining half of the recess is placed a strong spiral spring, between the fixed nut and the movable follower, with tension enough to force these apart and thus remove any lost motion which may occur in the screw. The tangent screw is attached to the plates by a modification of the gimballing of a ship's compass. A new eye-piece and improved lenses give a clear and sharply defined field of view, and one so flat that the cross hairs are without parallax in any part of it, and micrometer hairs or stadia can be used. Platinum cross-hairs, 1-1000th of an inch thick, are used. The screws are lubricated with plumbago. A simple arrangement of the clamps on the axle of the transit, makes it answer the purpose of a pair of compass sights for taking off-sets.

**DIMENSIONS OF NARROW GAUGE ENGINES.** It appears that a narrow gauge locomotive, with driving wheels 36 inches in diameter, and cylinder with 16 inch stroke, at a speed of 36 miles per hour, develops the same speed of piston as a full gauge locomotive with 5 feet driving wheels and cylinder with 24 inch stroke, at a speed of 40 miles per hour. With driving wheels 40 inches in diameter, and 16 inches stroke of piston, the narrow gauge locomotive develops the same travel of piston in going one mile as does the full gauge locomotive with 60 inch driving wheels and 24 inch stroke of piston. Equal speeds are therefore attainable on the narrow as on the full gauge. The angle of stability of the narrow gauge locomotive, with 3 feet driving wheel, is somewhat greater than that of the common locomotive with 5 feet driving wheel. Many interested in the success of the narrow gauge system have been puzzled to understand why engineers claim equal safety and speed for the former with the wider gauge. The above facts give the reasons for these claims.—*Iron Age.*

**MACHINE FOR FOLDING, PASTING AND TRIMMING PAPERS.**—Messrs. Chambers & Co., of Philadelphia, have invented a new machine, which they have made for *Every Saturday*, of Boston. The *Record* says: It is the only machine of the kind in the world, and is really a wonder in its working, accomplishing the various processes of folding, pasting and trimming at one operation. The two sheets of which *Every Saturday* is composed are fed in at opposite ends, taken up by the machine and carried toward each other, while by a series of automatic movements they are folded, trimmed and pasted in transit; arriving simultaneously at the center of the machine, the smaller sheet is placed accurately inside the larger one, and both receive their final fold and are deposited carefully in the box placed for them, a perfect paper. This operation is repeated, when the machine is at its highest speed, 30 times per minute, without mistake or variation.

**BRONZE BUST OF IRVING.**—A colossal bust of Washington Irving is to be erected in Prospect Park, Brooklyn, New York. With the pedestal, it will be 14 feet high. All the work has been done in the U. S.

## SCIENTIFIC PROGRESS.

**AMERICAN TELEGRAPHIC HISTORY.**—In Prof. Morse's address at the unveiling of the statue in New York City Central Park, he alluded to the history of the telegraph in the U. S. We condense: To Alfred Vail, of Morristown, N. J. with his father and brother, is due the first important aid in the progress of the invention. Aided also by Professor Gale, the telegraph appeared in Washington in 1838, a suppliant for the means to demonstrate its power. To the Hon. F. O. J. Smith, then Chairman of the House Committee of Commerce, belongs the credit of a just appreciation of the new invention, and of a zealous advocacy of an experimental essay, and of the inditing of an admirably written report in its favor, signed by every member of the committee. It was nevertheless thrown aside among the unfinished business of the session; and now commenced days of trial. Years of delay were yet before it. It was not till 1842 that it was again submitted to Congress. Ferris, and Kennedy, and Winthrop, and Ayerigg, McClay, and Wood, and many others, rallied to its support, and at length, by a bare majority, the bill that was necessary was sent to the Senate, where it met with no opposition, and was passed the last night of the session. Now commenced a new series of trials. To Ezra Cornell is due the credit of early and effective aid in the superintendence and erection of the first public line of telegraph ever established. Notwithstanding the success of the experimental essay, another important step was necessary ere the invention could demonstrate its vast utility. It was not until the skill and experience of the best Postmaster General that ever held that office, the Hon. Amos Kendall, were brought into requisition, that, amid many discouragements, the various companies were organized, and in the hands of such enterprising men as Sibley, Swain, and Wade, and a host of determined men, this vast country was webbed with telegraphic wires.

Another grand stride was yet to be taken ere international communication could be established. In October, 1842, the first submarine telegraph cable was laid by me in one moonlight night, in the harbor of this city, which proved experimentally the practicability of submarine telegraphy, and from the result of this success I ventured, the year after, in a letter to the Secretary of the Treasury, to predict the certainty of the Atlantic Telegraph. It was then believed to be a visionary dream; and had the individual carrying out of so bold an enterprise depended upon me alone, it might still have been a dream. But at this crisis another mind was touched with the necessary enthusiasm, admirably fitted in every particular to undertake the novel attempt.

To Cyrus W. Field, more than to any other individual, belongs the honor of carrying to completion this great undertaking. Associating with himself Cooper, and Taylor, and Roberts, and White, and Hunt, and Dudley Field, and others on this side of the Atlantic, and, two years later, Peabody and Breet, and Brooking, and Lampson, and Gurney, and Morgan and others in Great Britain, making the ocean but an insignificant ferry by his repeated crossings, undaunted by temporary failures and unforeseen accidents, he rested not till Britain and America were united in telegraphic bonds—the Old and the New World in instantaneous communication.

**COMPRESSED SLACK COAL.**—The *Iron Age* says that the process of E. F. Loiseau has been tried in Philadelphia with good results, on anthracite waste, and has been successfully used for four months at Nashville, Tenn. Only 7 per cent. of clay is used. The fuel is rendered water-proof (which is necessary) by dipping the prepared balls into a liquid composed of 18 lbs. rosin and 3 gals. gasoline, or benzine, to the ton of fuel. The coal is sufficiently compact to allow transportation and storing, burns nicely, produces but little ash and no cinder, ignites readily, and maintains its shape until thoroughly consumed. It answers well in heating and cupola furnaces. It is now retailed at \$5 per ton.

**OZONE ACTS ON EXPLOSIVE COMPOUNDS.** It has been found, says the *Journal of Ap. Chem.* that ozone will decompose nitroglycerine into nitric acid and glycerine acid. Nitro-cellulose (gun-cotton) and nitro-mannite yield nitric acid and oxalic acid. When gun cotton undergoes spontaneous decomposition, a similar class of compounds is produced, but what is rather remarkable in this case is the fact that

sealed packages of gun cotton are more likely to decompose spontaneously than open ones, as if the ozone was generated in the closed bottle and not in the open one. Air rich in ozone will cause the explosion of several of the nitro compounds. It would be interesting to know if the explosion of powder mills could not be traced to the action of an unusual quantity of ozone generated by thunder storms in the air, rather than to the direct action of the lightning. The powerful decomposing action of ozone calls attention to it as a useful agent in many branches of manufacture, and the importance of devising some way of generating it economically and in large quantity is more pressing than ever.

**ELECTRICAL SHADOWS.**—In a paper in the *Amer. Jour. of Science*, Prof. A. W. Wright, of Williams College, admits the possibility of the impression of outline images upon the surfaces of other objects. He says:—"The formation of the electrical shadow, discussed in my former paper, as has been suggested by Mr. C. F. Varley, who has more recently obtained results similar to those there described, appears to afford a satisfactory explanation of a singular and very interesting phenomenon, which has occasionally been observed in the case of objects struck by lightning, especially of persons killed by it. A number of instances are on record where the person struck was found to have, impressed upon some portion of the body, a delineation of something near him at the time of the stroke, and a similar effect has been noticed, also, in the case of inanimate objects. The experiments in the production of the electrical shadows show that it is merely necessary that the object should interrupt the lines of action of the electricity, and that it may be at a considerable distance from the electrified cloud, the chief and indispensable condition being that the latter should be negatively electrified. We should then have the body exposed to the lightning, perfectly electrified by induction, and, as the tension became sufficient, the dark discharge accompanied by the glow would take place, followed by the lightning stroke. If, then, any object should be in the path of the discharge, its image would be formed in the glow, and this might, in rare cases like those recorded, be sufficiently intense to leave a permanently visible impression."

**FIXING MAGNETIC LINES.**—Prof. A. M. Mayer has invented a very perfect method of fixing the figures produced by iron filings when set in momentary vibration on a surface over a magnet. He wets a clean glass plate with shellac, dries it, places it over, and just touching, a magnet or magnets, with its ends supported on wooden rests. Iron filings are then uniformly sifted over the plate, and the spectrum produced by tapping it with a copper wire. A heated cast iron plate is then placed over the glass plate (which has been cautiously removed), and the iron filings, absorbing the radiated heat, sink into the softened film of shellac and are thus fixed. Plates thus produced serve for the most accurate measurements upon the magnetic field, can be photographed or used as lantern slides. They give most perfect images of the magnetic curves.—*Mech. Mag.*

**LITHOFRACTEUR,** as we learn from *Engineering*, although extensively used in Germany for over two years, has just been introduced into England. It is the invention of Prof. Engels, of Cologne, and consists of nitro-glycerine as a base, gun cotton, the constituents of gunpowder, some chlorates, and infusorial earth. These substances are mixed in special ways (kept secret) until they form a black putty-like compound, which is made up into paper cartridges, 4½ inches long and ¾ inch in diam., weighing 1¼ ozs. each. When lighted in the air by ordinary means, it burns quietly, but when ignited by a cap it explodes violently. Various attempts to explode it by most violent shocks, as in railroad collisions, failed, while its power in quarries, mines, etc., when exploded by the cap, was tested most successfully.

**BOILING POINT OF GLYCERINE.**—Says the *Chem. News*: When the pressure in the still is reduced to 12.5 m. m., chiefly water goes over. When the boiling point under constant pressure has risen to 179.5° F., perfectly pure anhydrous glycerine condenses in the receiver. Under a pressure of 50 m. m., glycerine distills over unchanged at 210° C. 2 parts glycerine and 3 parts water freeze at 112° F.; 1 part glycerine and 1 part water, at 6° F.; 1 part glycerine and 3 parts water, at 20° F.

## CORRESPONDENCE.

## A Trip to Colorado—2.

[Written for the PRESS.]  
Scenery about Denver.

At Denver I find myself in a favored spot. Here we have fine views of the snow-capped ranges and of prominent peaks far distant, yet easily seen through the clear atmosphere. Of the scenery here much has been said and written. I have been told that, in this respect, the place vies with Berne, in Switzerland. I acknowledge never having visited this last named city, and therefore am strongly convinced that Denver beats it.

And I have some serious reasons for this conviction. Around Denver you can find scenes of rural prosperity and beauty—a fertile soil, a charming climate, coal, iron and copper mines. Some forty miles off, you reach Central City and its gold mines. Georgetown is ten hours distant with her treasures of silver. On the road to the latter place—a beautiful road—in South Clear Creek valley, are cold and warm soda springs, great luxuries for the traveler. Beyond it lies Gray's Peak, said to be 14,245 feet high, the "apex of the North American Continent." You can easily get to the Parks of Colorado, wonderful places, to mountain lakes and peaks too numerous to mention. Not only does the region afford natural scenery which may or may not equal that at Berne, but it also affords many other features of surpassing interest, the existence of which around Berne I am not aware of.

## Manufactures.

Denver is a busy place, with manifold signs of rapidly increasing prosperity. I am now writing on paper made in the vicinity, not in Denver exactly, but at Golden (by the Golden City Paper Co.) not far off. Denver imports quite largely from California. I am told that annually \$50,000 worth of California fruits is sent to Colorado, and I see California blankets everywhere.

There are three banks and banking houses here, six churches, a convent, two large seminaries and two free schools. There are two flouring mills, three planing mills, a woolen mill, a foundry, pottery, brick yards, wagon factories, jewelry factories, etc., etc. There are four hotels, the American, Sargent's, Broadwell and Tremont, all respectable, I am told, but the first two of the highest standing. There are gas works for supplying the city with light.

The Denver Foundry and Machine Shop, James W. Jackson, does a fine business in mining machinery, sawmills, flour mills, etc. The Denver Woolen Mills commenced operations last August, with \$50,000 invested in building and machinery. This is known as a 3-set mill, has also 2 blanket looms and 5 narrow looms. It employs 12 hands, and has manufactured goods of the value of \$5,000 in four months. Good Merino wool is worth 28 cents wholesale. I visited the mill, and was pleased with its appearance.

There are three newspapers published here. The *Rocky Mountain News* is the pioneer paper of the country, and is well edited and conducted. The *Colorado Tribune* is an interesting sheet, published daily and weekly by Walker & Woodbury. The *Herald* is a weekly journal.

The U. S. Branch Mint or Assay Office is located here, and its operations are conducted in the most satisfactory manner, under the management of J. L. F. Schirmer.

During the month of June, the Branch Mint received 7,838.54 ounces of gold bullion, valued at \$132,179.03; of silver bullion, 810.22 ounces were received, amounting to \$1,028.92. The total value of receipts was \$133,207.95. The bullion made two hundred and eighteen gold bars, and two of silver.

## Stages—Railroads—Items.

Denver is the point of departure of the stages for Georgetown, Central and other mining districts; also to Pueblo, 150 miles south, Trinidad, 225 miles, Fort Lyon, 300 miles, and Santa Fé, 450 miles south.

Four railroads terminate here: the Kansas Pacific, the Denver Pacific, the Colorado Central, and the Boulder Valley. The building of the Denver and Rio Grande, from Denver to Colorado City, Pueblo, Cañon City, San Luis Park, and

finally to El Paso, New Mexico, will give this place a very large amount of trade. All the bonds for the first 80 miles of this road have been sold, rails have been bought in England and shipped via New Orleans and St. Louis, and 1,300 tons are now on the way. The officers of the road are W. J. Palmer (President), R. H. Lamhorn (Vice-President), W. H. Greenwood (General Manager) and J. P. Mersereau (Chief Engineer.)

But I might write all day concerning this place. A few items more must suffice. One important article of trade here is coal. It is brought hither from five different mines: Hazelton's, in Jefferson county; Eulmer's, Briggs', Murphy's and Marshall's, in Boulder county. These are respectively 18, 19, 22, 23, and 25 miles distant. The average price is \$9 per ton. The lumber business is a large one, and there are six large lumber yards here. The total value of Denver manufactures last year is given as nearly \$600,000. Smelting works in the vicinity are talked of. The cattle business is bound to be an important one.

## Colorado Agricultural Society.

The Colorado Agricultural Society has grounds and buildings about two miles from the city in a fine location. It has in view the interests of the whole Territory, and the advancement of all industries, mining, agricultural and manufacturing. The first annual exhibition was held here in 1866, and was a success. The next one will commence on September 12th, and continue until the 16th. I predict that this too will be successful, judging from the interest shown here. The officers are as follows: President, H. B. Pearce; Secretary, Fred. A. Clifton; Treasurer, Frank Palmer; Executive Committee, W. N. Byers, G. T. Clark, J. E. Bates, J. H. Veasey, H. G. Bond; Superintendents of Classes—Class A, Agricultural, F. C. Taylor; Class B, Mechanical Arts and Agricultural Implements, E. A. Willoughby; Class C, Farm Products, etc., C. H. McLaughlin; Class D, Horticulture and Floriculture, Chas. Ruter; Class E, Fine Arts, John Armor; Class F, Geology and Mineralogy, Prof. F. Schirmer; Class G, Poultry, Sheep, Swine, etc., M. M. Trimble; Class H, Horses, etc., John E. Force; Class I, Cattle, J. L. Bailey.

W. H. M.

## Swamp and Salt Marsh Lands.

EDITORS PRESS:—As there appears to be much more interest manifested in our swamp lands, in the last two years, than previously, perhaps it would be as well for you to republish an article given by me in 1865 to the *Rural Home Journal*, on the modes of reclaiming such lands, and growing rice in South Carolina, by a cousin of mine who was a large rice planter there.

## Trunks and Gates.

The trunks and tide gates described by me have been in use for many years, and have been found to answer the purpose better than any others. The advantage of these is that being hung on upright pivots, ten or eleven feet long, the gate opens and closes with a smaller pressure of water, and is less likely to be obstructed—the pivot rod being above the water does not rust and prevent the gate from shutting close down as the hinges do below the water,—and if necessary to irrigate or flood the lands as has been the case this year on some of the reclaimed tule land on the San Joaquin, it can be done by leaving the outer gate open without the necessity of watching the tides—being self-adjusting. Several years since I gave the plan to a friend, who tried them on the San Joaquin and found them to work very well.

## Ditches.

In some cases it may be necessary to make the center ditch under the embankment, but I think from the examinations I have made that the banks of the rivers and sloughs are generally firm enough to omit it. The trouble in the experiments made here, is that the ditches have been too small and the dyke or embankment is placed too near the ditch; the latter should be from 12 to 15 feet wide, and the levee at least ten or fifteen feet from the ditch, and made only sufficiently high to keep out ordinary floods and tides, and with a greater slope on the outside next the river; then sown immediately with timo-

thy or some other good sod grass that would keep the levee firm and solid. The levees here have been built too much like a wall, the sods placed on it like adobe bricks, the peaty soil of which they are composed becomes dry and light, above the water line, leaving large cracks, and are liable to float off on the first flood. I do not think it is policy to levee against such floods as we had in 1862.

## Reclaiming Salt Marsh.

The salt marsh around the haye, if properly reclaimed and rightly managed, cannot fail to be very productive. A levee one foot above the highest ebbing tides will be amply sufficient. During the winter, keep the inner gates closed, flood the lands as often as possible from the rains and with fresh water streams from the uplands; then in the spring sow it down in grass for pasture or hay. In the Eastern States such lands reclaimed and sown with timothy, red-top and clover have produced from a ton and a half to three tons per acre, also good crops of corn, rye, broom-corn, sugar beets and mangel-wurtzel have been obtained. C. D. GIBBS, C. E.

## Suspension Chutes for Loading Vessels.

ENS. PRESS:—The great improvement now being made in this vicinity is the suspension chute at Pigeon Point.

This important work has been undertaken by Messrs. Moore and Templeton, the former of your city, the latter of Redwood City.

The "Suspension Chute" is a California invention, and is another illustration of the skill, wisdom and perseverance of the American people in overcoming all obstacles to production and progress.

The bluff shores of California, and the scarcity of small harbors, have been great drawbacks to coast-wise traffic. To this, add the fact that many fertile valleys and valuable forests are cut off from the interior by the "Inner Coast Range," and we readily see that the cost of shipment often equal, if it does not exceed, the first cost of production. This evil is partly overcome by the use of "Suspension Chutes." They have been tried in Sonoma county, and have given much satisfaction.

B. C. Bell, who has built six, and won some reputation for skill and reliability, has charge of the construction of the present one, which is, I understand, the largest he has undertaken to build.

## The Mode of Construction.

The work will be 600 feet long, commencing level with the bank, and extending out to 40 feet water. I cannot, without a sketch, give all of your readers a clear idea of the structure, but will give a general description—such as I can with words and figures.

The inner and middle portion of the wharf is built upon frames of various heights, according to the nature of the bluffs. The outer end of the permanent wharf is 50 feet above water, supported by double bents. The three outer, lower bents are let into the solid rock two feet, and tamped with asphaltum. The posts are sheathed by yellow metal for five feet. They are held down and in place by strong iron rods, tightened by turn-buckles. Beyond the outer bent the wharf projects 60 feet, supported by brace work.

The suspended chute is hinged in three nearly equal parts, and is 102 feet long. This is suspended from a boom, which is itself suspended from shears or masts, 77 feet high. All of this suspended work projects 162 feet beyond the self-supporting part of the wharf.

The standing rigging is all of iron. The main braces for tower or shears are 1½ inch wire rope; other braces ¾ inch wire rope. The whole is well supported and braced by wire ropes attached to eye-bolts, let into solid rock. The main eye-bolts are of 3-inch iron, and are let into the rock 3 feet, and leaded. The effort is thus made to form a structure which will keep its place during our southeast storms.

The chute is double—one side for lumber and wood, the other for produce and the truck when unloading vessels. This can be raised or lowered to suit the tide or the size of vessels, which are moored in 40 feet water.

The total cost of construction is estimated at \$10,000. In connection with this work, and by far the most expensive, is a

## Wooden Canal

From the head waters of the Gazos creek to the sea board, about 7 miles in length, and a tramway about 1½ miles in length, leading to the head of the wharf.

This canal is 48 inches in width at top,

and is designed for floating lumber, timber, firewood, etc., to the place of shipment.

Already 5 miles of canal are in operation, and the work will be pushed steadily on to completion. Perhaps a month more will see the chute in operation, if not the completed canal and tramway.

JESSE ARRI.

Pescadero, July 13.

## Smelting at White Pine.

EDITORS PRESS:—In my communication published in the SCIENTIFIC PRESS of June 24, a single error occurs in my table of deductions. The figures for commissions, dress, etc., at 20 per cent., should be \$567, instead of \$467, as printed; for example, the advance, at \$90 per ton, for 31½ tons, is \$2,835.20=\$567.00. But as this estimate of loss is twice as much as it should be, and as it will make no material difference in the quotient of profits, you can do as you please about correcting it. For I now find, from information furnished me by competent authority, that there were 37½ tons of bullion produced, instead of 31½ tons. Also, that there was no freight-charge to Hamilton, as given in the table. These additions make a difference in favor of the smelter as follows:

6 tons of bullion additional at \$90 per ton.....	\$540.00
Freightage allowed to Hamilton.....	126.00
Add profits as per table.....	299.50
Total .....	\$965.50

From which must be deducted the freight charge for 6 tons to San Francisco, at \$35 per ton, and \$1 per ton for drayage, leaving as net profits the sum of \$731.25. Make the loss on commissions and dress but 10 per cent., and the figures stand thus:

One-half of \$567.00.....	\$283.50
Profit for ten days' run.....	\$1,014.75
Besides the silver in the additional 6 tons, \$324.	

Your compositors have in one case corrected my punctuation and thereby falsified my grammar. If, however, they follow my punctuation, my grammar will generally be found correct. For instance, one sentence was originally written, "The fact is, Messrs. Editors, our smelters, not content with the lion's share of the proceeds of our mines, which they were always sure of, have desired, to use an expressive White Pine phrase, to 'hog it all.'" I am a little sensitive on this point, and you must please forgive my criticism.

TRUTH-TELLER.

Shermantown, Nev., June 30, 1871.

## A Prediction.

ENS. PRESS:—Allow me to call your attention to a fact—a little out of the way in mining—but one in which many have been deeply interested on both sides. It is a prediction in relation to the late "unpleasantness" between France and Prussia, made years ago by Sir. Walter Scott.

In his "Marmion," introduction to Canto Third, 3d verse, he speaks of the old hero, the star of Bradeburg, "Brunswick," and of his untimely fall; of Prussia overthrown at Jena; of the wrongs and woes of Germany in consequence of defeat; and concludes by saying:

"And when revolves, in time's sure change,  
The hour of Germany's Revenge;  
When, breathing fury for her sake,  
Some new Arminius shall awake;  
Her champion, ere he strike, shall come  
To whet his sword on Brunswick's tomb."

As this prophecy has not made its appearance in any of the periodicals of the day, allow me to call your attention to it.

C. B. N.

Durango, Mexico.

## Thimble Skein Wagons, Etc.

EDITORS PRESS:—I have often asked well-informed persons why there is so much difference of opinion on the subject of iron axle and thimble skein wagons, and as I have not received a very satisfactory answer as yet, I have thought it might be answered by some of your readers, and perhaps important to not a few. Some prefer an iron axle wagon to a thimble skein, saying it runs lighter, being equal in other respects; but some prefer the thimble skein, giving the same reasons. Some want the chambered boxing, as in the Studebaker wagon; others the straight boxing, as in Soule's Improved Wagon, of Sacramento, who says his thimbles are on the principle of the Concord coach wagons and better than all others. C. L. SEE.  
Nicolaus, 1871.

## MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

### California.

#### ALPINE COUNTY.

**RICH COPPER ORE.**—According to the *Monitor* the Globe management has been offered \$50 per ton for their copper ore on the dump.

#### AMADOR COUNTY.

**THE MINERS** are quiet and willing to go to work at the following wages: The men working underground to receive \$2 50 and \$3 per day, and those working on top to receive the wages they were getting before the strike. It is the impression of the *Amador Ledger* that work will soon be commenced on a basis satisfactory to all concerned.

**THE MINES.**—*Ledger*, July 15th: At this writing, all our mines and mills are in operation with all the men they can find employment for. The prospects are that there will be no further difficulty about getting all the help that may be required to keep both the mine and mills in constant operation from this on.

The *Sentinel*, Jackson, July, 15th: says that for some time past teams have been passing our office every day, heavily laden with quartz, being hauled from the Blackwell ledge to the Occidental mill.

#### GALAVÉRAS COUNTY.

**WORK**, says the *Chronicle* is steadily progressing on the old Foot & Thompson quartz lead near Rich Gulch Flat. The tunnels are so badly caved that it is extremely difficult to open them, with the force employed, but the mine will soon be placed in condition for working.

The *Chronicle* gives encouraging accounts from the gravel mines. The What Cheer mine has assumed considerable prominence of late. The hoisting works are of the most substantial character, and the mine is in the hands of practical men.

The Shaw claim, a mile and a half from Mokelumne Hill, is the most extensive mine in the county, and has yielded more gold than any other. The sluices are 800 feet in length, and to secure the requisite fall required a tunnel 400 feet. They are cleaned up twice a year. Owing to a scarcity of water the mine is now closed for the season.

The Bracket & Brucker rank among the best in the district, and has been a paying institution for years. The gravel is crushed in a 5-stamp mill. The mine is paying well.

Bates, Barry & Co., half a mile from town, have a tunnel 12,000 feet long. They have met with many discouragements and difficulties which are now, happily, all overcome, and they are taking out good gravel in abundance. A water-blast supplies an abundance of air for ventilation.

#### INYO COUNTY.

The Los Angeles *News*, July 15, learns from a gentleman just from the mines, that Mehan's mill will start up during the next week. The Parson's mill has been idle, but will also commence operations on Monday next. A brisk time from this out is anticipated by all the residents of the mining districts.

**BULLION.**—The same paper says 460 bars silver lead bullion, weighing 38,775 pounds, were received at the depot yesterday from the Union Works, Cerro Gordo district.

The *Independent* furnishes the annexed items:—A new ten-stamp mill is giving up in the Hot Springs district. A Stedefeldt furnace is to be added, the whole making a reduction works of the most complete character.

Beadry's furnace was again started up week ago last Wednesday, and in the first twenty-four hours run out one hundred and fourteen bars of bullion.

On the 28th ultimo there were shipped by Wells, Fargo & Co., three bars of bullion from the Kearsarge, weighing, 2,556 ounces.

#### NEVADA COUNTY.

**THE MINING SITUATION.**—The Grass Valley *Union* gives a lengthy editorial under the above head, from which it appears that the mining business in that vicinity is in as flourishing a condition, taking all things into consideration, as at any time in the past. Prospecting is very active in quartz and in gravel mining, and prospectors are succeeding well. The custom mills are kept running most of the time, and the Superintendents of these mills inform us that the rock put through is unusually rich. We have only space this morning

for the mention of a limited number of mines.

**LARGE YIELD OF GOLD.**—The same paper says that a few days since the Seven-Thirty mine, located about 4 miles southwest of Grass Valley, had 21 loads of quartz crushed, which yielded \$4,410, or \$210 for each load. The Seven-Thirty is on the same ledge as the Bowers. The Tornado is also in the same vicinity.

**ALTA Co. No. 3.**—An 8-stamp crushing mill to be run by steam, and to be used to crush cement, has been hauled to the ground of the Alta Company No. 3. In about three weeks the mill will be running. The mine looks well.

**THE OLD SOGGS MINE**, at Nevada, according to the *Transcript*, is again being worked and will no doubt soon be made a paying institution. It formerly paid well; but latterly, under had management ceased to pay and work was discontinued. It is expected that work will be resumed on other mines, on which work has been suspended.

**MINING SALE.**—Sargent & Jacobs have purchased the Nebraska Co.'s ditch and diggings above Quaker Hill.

**RICH STRIKE.**—Orr and Corns have struck an exceedingly rich ledge near South Fork, Eureka township. The ledge is six inches wide and our informant says nearly one-third gold.

#### PLACER COUNTY.

**OPHIR DISTRICT.**—The recent rich developments of the several mines in this district have caused considerable excitement among capitalists and mining men, and further developments are still being made.

Johnson & Co. opened a rich ledge near the St. Patrick, last week. These three men, says the *Herald*, had sunk a shaft some fourteen feet when they opened on rock that pays some six or seven dollars to the pound; or, if it holds out, about \$12,000 to the ton. At last accounts, two of the men were quarrying the rock and packing it to the cabin where the other was pounding out the gold by the use of a common hand mortar. This discovery has created additional excitement in this rich quartz district.

**ANOTHER RICH DEVELOPMENT.**—W. H. Puffer has recently developed a quartz ledge on the south side of Dutch ravine, about three-quarters of a mile below Newcastle, which, as far as opened in compares favorably with the richest mines yet opened in this vicinity or anywhere in the State. They made a crushing last week which resulted in \$60 per ton for 28 tons of unselected rock. They think the rock they are now taking out from five inch ledge in the bottom of the shaft will pay \$150 to the ton.

#### SIERRA COUNTY.

**STARTED UP.**—Downieville *Age*, July 12th: The company owning the quartz ledge near the watering trough on Good-year's hill, have commenced work in earnest; they are putting on a force of men, and will put up a 20-stamp mill forthwith. The specimens from this mine will compare favorably with any mine in the county.

### Nevada.

#### HUMBOLDT.

**BULLION SHIPMENT.**—The amount of bullion shipped from the Arizona mine, through Wells, Fargo & Co., since our last issue, was \$8,000.

The Grant mine has been purchased by Mark F. Ashley, who intends putting on a force of miners at an early day.

The English copper mine, near Galena, is yielding satisfactorily, with a promise of becoming a very valuable property; 20 or 30 miners are employed.

#### WASHOE.

**THE CHOLLAR POTOSI.**—It appears from the last annual report of this mine that it has yielded a total to this time of \$10,057,573, of which about one-half has been paid for working the ores.

**MINING YIELD.**—During the last week 624 tons of ore was taken from the Hale & Norcross mine and 1,135 tons from the Savage mine, the latter assaying \$29.08 per ton. The June receipts of the Chollar-Potosi aggregate \$181,500; Kentucky, \$21,700; Succor, \$11,900.

The Lady Bryan mill is in constant operation, crushing on the average 28 tons of ore per day. The ore breasts on the 80-foot level are of late much improved in appearance, and the ore is now paying better than ever before.

**THE SAVAGE.**—The tunnel running southward from the bottom shaft through to the Hale & Norcross, or that portion of it which was blocked up by the debris forced into it at the time of striking the body of water in the drift east, has been cleaned out and thoroughly repaired.

**SEGREGATED BELCHER.**—This company

will probably sink a new shaft to the eastward of their present main shaft. Either this must be done, or the one through which they are now working must be put down some 500 feet deeper.

**SHUT DOWN.**—*Enterprise*, July 16th: The Imperial Mining Company shut down their works last night. When they will be started up again no one knows. The depth of their main shaft is 1,300 feet. From this they have run drifts toward all points of the compass, raised shafts and sunk winzes from cross drifts and main drifts, completely honey-combing their ground without finding paying ore.

#### WHITE PINE.

The International is closed for repairs. The shipments of bullion since the mill got fairly under way has averaged \$40,000 per week. Over 1,000 tons of ore are now at the mill awaiting reduction.

The Stanford mill which had been closed for repairs, was started again on the 6th inst., with over 1,200 tons of ore on hand, and ore is still going to the mill.

The Gov. Blaisdell, the Beecher Consolidated and Ward Beecher, show marked signs of improvement.

**BEERHARDT.**—The *News* says the new drift in prospect shaft shows strong indications of soon striking ore. Now hoisting ore of same grade as mentioned in our last—about \$50 per ton. Shipping by tramway daily to International mill about 30 tons. Working 30 men. The tramway is improving regularly in its working.

**SOUTH AURORA.**—Shipping ore to the Stanford mill by team, but will soon commence by tramway. Working 90 men.

### Arizona.

**THE GREAT VULTURE GOLD MINE** which is claimed to be the richest ever discovered, is located 12 miles from Wickenburg at which place there is no water at the mine; all the rock has to be hauled. The mine was discovered about two years ago, and at once attracted universal attention by its extraordinary richness. A company was formed in New York and the mine opened. They had only got fairly started, however, before they were attacked by the Indians, the workmen at the mine killed or driven away and everything about the place burned. There was too much gold in the lead to abandon it, and a new force was put to work. Since then, although several skirmishes have occurred at the mine and in its vicinity, the work has steadily progressed. The hauling of the rock from the mine to the mill at Wickenburg is a work of considerable peril, and notwithstanding the precaution of sending large trains together and usually accompanied by a guard of soldiers.

**ARIZONA NEWS.**—The *Miner* of the 1st says: Many new ledges of silver and gold rock have been found in Wallapai District, Mohave county.

The latest news from Bradshaw is better than any previously received. Mr. Walsh, foreman of the Original Tiger, writes Mr. French that the ledge was looking splendid. Other persons say the other mines were developing finely.

### British Columbia.

**PEACE RIVER MINES.**—We take the following items from a correspondence in the *British Colonist*, in relation to the new mines, dated at Skeena Forks, June 5, 1871.

With regard to the mining news it is all that could be desired. A canoe arrived last night bringing the intelligence that the miners who passed up early this spring have struck several creeks and gulches that will pay well.

Diggings have been struck on Germansen Creek, eight miles higher up than the Discovery claim, that will pay six ounces a day to the hand.

A new creek lying west of Germansen has been discovered that will pay equally as well.

There is now no anxiety felt about the richness of the diggings. The whole Peace River country is full of gold, the climate is mild and healthful, and communication with the principal points of supply not much longer than those of Cariboo. Over 700 men have gone up.

**CARIBOO.**—A telegraph line has been opened to the Cariboo mines. The machinery for the Cariboo Mining Co. was to have been on the ground by the 10th of July, and the mill is expected to be in operation during the month of August. This mine is thought to be of extraordinary value—millions is the talk. The ground of this company is situated in the "Meadows," the lower part of Williams Creek, where in no place a shaft has been sunk without getting good prospects. The Colonial Government granted the company several miles of the creek, and with steam machinery it is believed they have the

chance of most brilliant returns.

### Colorado.

**GEORGETOWN.**—We gather the following items from the *Georgetown Miner*, July 13th:

**BULLION.**—The shipments of bullion for the week from the International, Argentine \$2,221.80. The bullion report of the Stewart Silver Reducing Co. from starting of mill, 1870, to July, '71—nine months, has been \$180,785—taken from 1,390 tons of ore.

The Main lode is being worked by Kennedy & Reynolds. The developments are extraordinary—the first-class ore yielding 719 ounces, and the second-class 272½ ounces to the ton.

A lot of ore taken from the Dives lode, treated at the Stewart Silver Reducing Works, yielded \$365 coin, per ton.

A new and rich discovery, called the 4th of July lode, has been made on McClellan mountain, by Tom C. Johns and W. J. Riley; which yields over 1,000 ounces per ton. The vein has been traced 2,000 feet. The discovery of this lode has created a sensation among prospectors.

**ABOVE THE TIMBER BELT.**—The International Reduction Works, and the Belmont and International mines, on McClellan mountain, Argentine District, at an altitude of 12,500 ft. have been worked all winter. Though the International is worked at a depth of 150 feet, the frost line has not yet been passed. The men are working in frozen earth and rock. We shall notice the mode of working this extraordinary mine more at length hereafter. The ore from this mine averages \$100 per ton.

The Belmont Lode is still higher up the mountain than the International, and is worked by ten men, the ore averaging, by mill treatment, \$130 per ton.

**THE TERRIBLE MINE.**—The report for the last six months is as follows:—1st class ore, 56 tons, at \$550 per ton; 2d class, 235 tons, at \$110; 3d class, 328 tons, at \$50. Gross aggregate \$73,000; expenses, \$46,000; net profits, \$27,000—a good showing. The mine has just been placed in good working order; is now on its second year of work and improving.

**SUMMIT COUNTY.**—Mining operations in this county are quite active. The St. Lawrence Company are taking measures to erect an Arcy Furnace. The Chataque and Walker lodes are being developed.

Great activity prevails at St. Johns. The Boston Silver Mining Association are rushing things. This company have a large quantity of ore out and a mine capable of yielding a large amount of ore every day.

Placer mining in Summit this year is very remunerative. We hear of one company that cleaned up twenty-seven pounds of gold from one run.

**CENTRAL CITY.**—We gather from the *Central City Register* as follows: The receipts of bullion at the Branch mint for the month of June, were in excess of any previous month in the year. The value of bullion received was \$132,179.

**BOULDER COUNTY.**—The Galena lodes in the Pewink District, now being worked are numerous, and average \$50 per ton in silver. Transportation and machinery are wanted.

**WARD DISTRICT.**—The Boston lode is extensively worked and paying well. Prof. Richardson is erecting reduction works in this district. Ed. Learned and associates have expended half a million on the Ni-Wot mill and mine. This mine is now in process of development. The surface rock yielded an average of 30 ozs. of gold per cord. About \$147,000 were taken out at a cost of some \$10,000.

**AN EXTRAORDINARY SILVER PLACER.**—A correspondent of the *Denver News*, gives a detailed description of a discovery of some rich silver placer diggings near the mountain village of Georgetown. The discoverers took out from \$1,000 to \$1,500 in three weeks. There is a great rush to the new locality, which is now known as "Silver Patch Diggings." Large holders of rich mineral are sometimes found weighing from 50 to (the largest) 432 pounds, and assaying from \$1,500 to \$2,000 ozs. per ton. Three valuable lodes have already been found.

**CARIBOU.**—The *Caribou Post* says that the excitement of the hour is over new discoveries on the north side of Caribou Hill. Not a day passes but that some fortunate one makes a strike, which he believes his fortune.

The Caribou Co. are raising ore from a splendid deposit of mineral; black sulphurets are brought up from a depth of 100 feet in chunks 2 feet thick. Much of the ore is valued at \$500 per ton.

The Hidden Treasure, recorded about

one year ago, is turning out large quantities of high grade ore. The Von Moltke, near by, is 3 feet thick at a depth of 20. They have now come upon a body of ore estimated at \$300 per ton.

**Box Miners.**—Three boys, from 12 to 13 years of age are sinking a shaft, and were daily expecting to "strike it rich." We hope they may.

### Idaho.

**FROM CARIBOO, IDAHO.**—A correspondent of the Corinne Journal gives the following items in regard to these new mines: "Jim Toland has got his claim running, and in one day and a half cleaned up three ounces for two men's labor. Monday, Jeff Thompson offered his claim for a horse; to day it cannot be bought for \$2,000; he has panned out fifty cents to the pan. Kinson & Low's diggings pay from \$3 to \$16 per day to the man. Stone & Fisher's claims are paying well. Keenan has a company of men making a ditch in Iowa gulch to take the water to ground that pays 15 cents to the pan. Horace Double and Jeff Waford are making \$10 per day to the man, over in "Bilk."

**IMPORTANT ENTERPRISE.**—A Bed-rock Tunnel Co. has been organized at Boise, to work the Moore, Elk, Grimes and Granite creeks. The capital stock is \$500,000. The *Statesman* says the work will be undertaken in good faith, and that the creeks mentioned are known to be rich.

### Montana.

**HENDERSON GULCH.**—*Helena Gazette*, July 10th: Though many changes have taken place, the fact is evident that this camp is prosperous and continues to yield as well as last year.

**BEAR GULCH.**—Foley & Co are busy, and their ground pans out about \$100 per week to the hand. The mines in Phelan Gulch are making big money. Talbot & Co.'s sluices were cleaned up by thieves a few nights ago—about \$500 gone.

**ELK CREEK.**—The miners here are in better condition than ever before. Mid-danah & Jones are taking out \$15 to \$20 to the hand. Kinds & Co., and Crogan & Co. are averaging from \$800 to \$1,000 per week, with two years work ahead. Dooley & Brogan have bought Jas. Dugans flume for \$3,500. This Co. have been offered \$24,000 for their ground in this camp.

**LINCOLN GULCH.**—Eleven companies are at work here; five whims are running; population of the camp 100—none idle.

Work in McClellan and Jefferson gulches is going on as usual. The Pull boys in the latter have been offered \$5,000 for their claims; Harris & Bros. are taking out \$50 per day to the hand. The Lone Man gulch has 80 tons of rock in sight.

**WEST SIDE ITEMS.**—*Helena Herald*, July 13th: Woodcock & Co.'s sluice boxes were robbed in Bear gulch last week, of about \$200 worth of dust. One company working at the head of Deep, is making \$100 per day to the man. Bilk gulch is paying well—much better than last year.

Water in Gold creek is getting low, and falling faster than ever before. Several pipes on Brattan bar have suspended for the season, and others will have to be stopped in a few days. Car & Co., of Boyle's gulch, on the Boulder, are making \$20 per day to the hand. Devine & Co. are rigging a wheel, and will shortly attempt to reach bed-rock in the main boulder. It is believed that if bed-rock can be reached it will be found rich.

**DR. HOPKINS** is running the Butterfield mill, and crushing ore from the Dakotah. Mr. B. P. Hopkins is running his mill for quartz from the Mandham lode, and the two furnaces at Argenta are kept in operation. All are reported doing well.

**FLINT CREEK.**—*Deer Lodge Independent*, June 30th: Bell & Co. have just completed the erection of a small water mill on the upper part of Flint creek, for testing ledges. A firm are engaged at Phillipsburg in taking out quartz, but the furnace and Stuart mill are idle, and will most likely so remain for the next two months.

**THE CABLE PLACERS.**—Same paper, July 8th: During four days' work in these mines the average was \$100 in gold and six tons of quartz rich in gold. Water coming in too rapidly work was suspended and the locality will be flumed.

**PILGRIM BAR.**—The following clean-ups are reported: Roe & Bell, \$6,400. Timber lake, Hogan & Co., \$700; Steele & Irvine, \$900; Brelsford & Co., \$1080; Beery & Holcomb, \$800.

**HIGHLAND.**—Away up on the very summit of the Rocky Mountains, is turning out better than ever before. The Only Chance company has just cleaned up 408 ounces of bullion, valued at about \$8,250. The Nevins company is doing better than ever, is working first-class ore, and the mine looks

remarkably well Park & Dickey, on Moose Creek, are making money fast. Trainer & Canovan have struck it rich in the bed-rock flume. They get prospects from 75 cents to \$3 per pan, and will shortly have a very large clean-up.

### Oregon.

**THE SANTIAM MINES.**—A correspondent of the *Willamette Farmer*, July 8th, has lately visited these mines. Quartzville, once the scene of busy mining operations, is now rapidly falling into decay. The quartz mill has been broken up, and that which was movable sold and taken away.

The Galena lead, some seven miles southeast, is being worked, and gives evidence of much value. It contains a large amount of silver, and systematic operations are being made in its development. When first opened it was only 5 inches thick; it is now 13 inches thick, and is known as the Cox lead.

**LEWIS RIVER GOLD MINES.**—The Kalama Beacon, July 11th, says: The town is yet agog with rumors of "a big thing" being struck somewhere up the river toward St. Helen's. The story goes, that Skellenger and a party were on that river hunting land claims, and happening to saunter upon a bar that looked auriferous, they commenced to prospect, and soon found a "pocket" that yielded an ounce; and subsequently found another spot where they washed an ounce from a dozen pans.

### Utah.

**BULLION.**—*Salt Lake Tribune*, July 11th: A large amount of bullion presents itself in front of Walker Bro's. from their mines in Little Cottonwood. Wood & Co. are receiving from 13 to 25 tons of bullion per day for shipment East. Wells, Fargo & Co. shipped to New York on Sunday last bullion to the value of \$7,995 from the Meadow Valley Works, Pioche. Large quantities of bullion are hourly arriving from the mines, while machinery and merchandise is being shipped to them by hundreds of teams.

**LARGE SALE OF MINING INTERESTS.**—Messrs. Seaman & Smalley have disposed of one-half of their mining interests in this Territory to Warren & Kingsbury, late of Illinois, for the sum of \$153,500. The property, which is very valuable, seems to have been sold at low figures, but it brings to the aid of the operators a couple of business men of great experience and enterprise, while it insures the success of the new company. Col. Warren was one of the pioneers of Colorado.

**NEW MINES.**—*Corinne Reporter*, July 15th: The hills about Bear lake are being prospected with very promising results. A ton of rock has been taken to Corinne to be tested.

**OPHIR CITY, July 9th: A large cave was discovered on the 30 inst., on the extension of the Sunnyside mine, by two miners who fell through into it from the bottom of a shaft in which they were working.**

**LION HILL.**—A careful estimate places the amount of ore now lying on the various dumps of mines on Lion Hill alone, at 6,000 tons, awaiting the completion of the stamp mills there. The average value of this aggregate amount is not less than \$150 per ton. The Sunnyside mine, lately and rapidly developed, is considered not only the best mine of that hill, but of the entire district. Its dump now contains twelve tons of \$1,000 ore, four tons of \$1,500 ore, and 100 tons of \$150 ore. A large number of excellent mines are now idle, waiting for the completion of reduction works.

**BINGHAM CANON.**—A correspondent of the *Nevada Transcript* writes as follows from this locality: The cost of living here is the same as in California, taking everything into consideration. We have no coin, it is all greenbacks. The mines are thought to be inexhaustible, but the same thing is lacking here that is in most mining camps, and that is capital to develop them. There is one advantage here, which is this: A poor man may strike a good lead near the surface, take out his ore, sack it, and sell it at his dump for what it is worth. Some are availing themselves of this opportunity. We have here two smelting furnaces. At present there is but very little ore taken out, compared to what there should be. The following is an assayed value of ore from several of the mines here: Buel & Co., \$40 per ton, on an average; West Jordan \$80 to \$250; Watson's \$30 to \$375; Blue Jacket, a copper mine, from 40 to 80 per cent. Junction, \$30; No You Don't, \$60. These mines are not any of them down over 125 feet, most of them from 20 to 60. We have assays here that go up into the thousands, but that is from selected ore and scarce at that.

### Mining Stock Market.

[San Francisco Stock and Exchange Board.]

THURSDAY EVE., JULY 20, 1871.

The principal feature in the Stock Market this week has been the rise in Hale & Norcross. This sold from \$72 to \$85 from Thursday to Monday and then rose to \$170, falling immediately to \$122½, and selling to-day at \$92 to \$82.

The following table gives last Thursday quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock during the week.

### Leather Market Report.

[Corrected weekly by Dolliver & Bro., No. 109 Post st.]

SOLE LEATHER.—Eastern shipments still keep the market firm and the demand good.	
City Tanned Leather, \$10.	25@30
Santa Cruz Leather, \$10.	25@30
Country Leather, \$10.	25@30
The French market remains the same. California skins are higher and in demand.	
Jodot, 11 to 12 Kil, per doz.	\$62 00@
Jodot, second choice, 11 to 12 Kil, per doz.	\$52 00@ 95 00
Lemino, 16 to 18 Kil, per doz.	\$38 00@ 63 00
Lemino, 12 to 13 Kil, per doz.	\$38 00@ 70 00
Cornellian, 16 Kil, per doz.	\$72 00@
Cornellian, 12 to 14 Kil, per doz.	\$65 00@ 70 00
Opera calf, per doz.	\$1 00@
Mercator calf, 16 Kil, per doz.	\$5 00@
Common French calf skins, per doz.	\$5 00@ 75 00
French Kips, per doz.	\$6 00@ 75 00
Eastern Hump Stuffed Calf, per doz.	\$8 00@ 12 00
Eastern Hump Stuffed Calf, per doz.	\$1 10@ 12 00
Eastern Calf for Backs, per doz.	\$8 00@ 12 00
French Road, for Top and Colors, per doz.	\$8 00@ 12 00
Sheep Roams for Linings, per doz.	\$5 00@ 10 00
Best Jodot calf Boot Legs, per pair.	\$5 00@ 5 50
Good French Calf Boot Legs, per pair.	\$4 50@ 5 00
French Calf Boot Legs, per pair.	\$4 00@
Harness Leather, per doz.	\$8 00@ 12 00
Trance or Brink, per doz.	\$3 40@ 7 00
Skirting Leather, per doz.	\$2 00@ 50 00
Wet Leather, per doz.	\$2 00@ 50 00
Buff Leather, per doz.	\$1 80@ 24 00
Wax Side Leather, per foot.	\$1 80@ 24 00

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

## PATENTS & INVENTIONS.

### Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING JULY 4TH.

PREPARING SEAL SKIN.—Louis Falkenau, San Francisco.

TILTING CHAIR.—Chas. R. Peters and William P. Taylor, San Francisco.

ROLLER SKATE.—Georgs Vincent, Stockton, Cal., assignor of two-thirds his right to Wm. H. Van Vlear and Charles D. Ladd, same place.

ROTARY SOD CUTTER.—Josiah Pool, Rio Vista, Cal.

TOILET PASTE.—Julis Desmarquess Young, San Francisco.

### Notices of Recent Patents.

IMPROVED PUNCH.—D.A. Faulkner, Centerville, Alameda county, Cal. This invention relates to improvements in stationary punches, such as are used for punching leather, metal and other substances; and it consists in the employment of an adjustable circular plate or disc which is provided with different sized holes, any of which can be readily brought under the punch. It also consists in an improved manner of attaching and operating this punch, so that it can be readily removed and replaced with a different size when necessary.

IMPROVED WAGON.—C. Elliott, Woodland, Cal. This invention applies to huggies, carriages and light wagons. It consists in a peculiar manner of mounting the bed or body upon the carriage frames, so as to secure an easy and undulating motion, and at the same time a strong and substantial construction, while the expenses of manufacture are kept within reasonable limits. The device recommends itself to the attention of carriage-builders and others.

AN IMPROVED IRONING AND STRETCHING BOARD.—J. W. Davis, Reno, Nevada. The object of this invention is to provide an ordinary ironing board with a stretching device, by means of which clothes and other fabrics, which have been shrunk by washing, can be stretched to their original length and set by ironing so that they will retain their length. The device is simple and of easy use, and is said to answer its purposes very well.

ROTARY ROASTING FURNACE.—F. Kessler, S. F. This is a combination of a stationary and a revolving hearth, one placed above the other, over which the heat from the furnace passes. The revolving hearth is placed below the stationary one, and first receives the heat from the grate. From the chamber in which this hearth revolves, the heat is led through a convenient flue to the upper chamber, which is provided with the stationary hearth. From this chamber the heat escapes to the open air. The ore is first fed from a hopper upon the stationary hearth of the upper chamber, where it is subjected to the action of the heat, being stirred meanwhile by a series of plows which are moved around over the hearth. After being sufficiently subjected to the action of the heat in this chamber, it is passed through proper gates to the revolving hearth of the lower chamber, by which it is carried slowly around beneath a horizontal shaft, which is provided with peculiarly shaped beaters and lifters which consecutively mat down the ore and lift it into the air, so that, by dropping, it is loosened up and exposed equally to the heat, thus also permitting the volatile gases to escape. After being sufficiently subjected to this process, it can be removed from the hearth by suitable traps or gates.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

THE St. Louis Iron Co. contemplate erecting the largest blast furnace in the U.S.

### Editorial Notes Eastward.—11.

#### Through Wyoming.

Now we come to the region of snow fences and snow sheds, for we are creeping slowly to high elevations. We pass into Wyoming Territory, and at Evanston see some of the coal mines, which form such an important part of this wealth of this section. We pass such mines also at Point of Rocks, Hallville, Black Buttes,

DALE CREEK BRIDGE, UNION PACIFIC RAILROAD.

Carbon and Rock Creek, but daylight permits us to see but a few of these points. Coal is not the only mineral, however, along the railroad, but copper, iron and gold are also reported at several places.

We breakfast next morning at Laramie,

and see that the farmers are taking advantage of the opportunities offered by this railroad and are settling up the country. We come to the great Valley of the Platte, of huge extent, rich and beautiful. We sail over the plains, which at sunset are lighted up with rich hues and present a scene of the deepest space. The morning sun shows us a like view, and we rush ever forward into the day, until we finally reach, in the middle of the afternoon, the

terminus of this road, and will rest awhile at Omaha.

### What a N. Y. Library Association Does.

Fifty years ago, a number of gentlemen

Elizabeth, Jersey City and Paterson, New Jersey. In the city, the library delivers books at the residences of members, if desired. It has just introduced the practice (being the first in the United States to do so) of circulating monthly and quarterly magazines and reviews as it circulates books. A weekly charge of five cents is made for their use. It has lately started a bindery of its own in its building, this being far more satisfactory and probably more economical than the old plan of giving out the work. The project has been mooted of having the library open on Sundays, but the feeling against it, on the part of those who have already secured comfortable homes, is so strong that the subject has been dropped for the present. As the library is intended principally for the use of clerks, so many of whom have no proper place of resort on Sunday, and many of whom would be kept from worse places if they had a pleasant place to go to, we hope that the plan may be carried out at no distant day.

There are, in connection with the institution, classes in French, German, Spanish, English, Phonography, Elocution and Gymnastics. These are self-supporting, but the attendance is growing small, and there is some question as to the advisability of continuing them all. The practice of public lecturing under the auspices of the association was once a

leading feature, but had died away for several years previous. It was successfully revived, however, last winter. The association has four free scholarships,—two in Columbia College and two in the University of New York. By law the President,

Vice-President and Treasurer of the library are *ex officio* trustees of the Institution for the Savings for Merchants' clerks.

These few items, which we have taken from the fiftieth annual report, will serve to show something of the scope and influence of the association. It is a great credit to New York that the institution can be in so flourishing a condition, and that it receives the aid which it does from the merchants of the great metropolis. It appears to have received a steady and liberal encouragement from the mercantile community from its start. We hope that the fiftieth annual report of the San Francisco association will be able to give a corresponding state of affairs.

SILK.—The Grass Valley Union of July 12th, says: The silkworm business this year, in this county, has been remarkably successful. The worms have hatched, attained full size and have spun without

SCENE ON THE PLAINS—CROSSING OF LOUP FORK RIVER.

famous for its plains, its healthy position, and from the fact that here the gentler sex have acted on jury duty, Wyoming being the first to make trial of female jurors. Before long we come to one of the most noted structures on the road, Dale Creek Bridge, some 700 feet long and 126 feet high, which is a monument to the skill of the U. P. R. R. engineers. [The accompanying illustrations are from Croft's Transcontinental Guide Book.] Soon we come to Sherman, the highest railroad station in the world, 8,242 feet above the level of the sea.

Now we glide on a downward grade, having surmounted all the difficulties of our path. At noon we are at Cheyenne, where the Denver Pacific branches off to the south.

#### Through Nebraska.

Between three and four o'clock we pass into Nebraska. On its rolling prairies we

founded in New York a Mercantile Library Association. This had in all 204 members during its first year, and acquired 1,000 volumes. Now this same association admits to its halls nearly thirteen thousand members, has on its shelves over one hundred and twenty-seven thousand volumes, and circulates in the course of one year two hundred and sixty-nine thousand publications. Its library is excelled in size by only three libraries in the country, and exceeds in circulation all others. Its annual income amounts to over forty-two thousand dollars, and it expends yearly some eleven thousand dollars in books.

Besides the main library, with its reading rooms, halls, etc., there is a branch library in another part of the city, and also branch offices in Yonkers, N. Y.; in Norwalk and in Stamford, Connecticut; and in

being troubled by any disease whatever. The season has been favorable, and, besides that, those engaged in the business have learned much about the worms. We saw yesterday samples of cocoons from Dimon's Silken Grove ranch, and they are very fine. These cocoons were spun by the French annual worm, and by the Salt Lake worm. The cocoons made by the Salt Lake worm are easily reeled, requiring no wetting or soaking in the process. Dimon informs us that his mulberries are flourishing beyond his expectations. He has not lost a worm this year, has plenty of eggs for next year, and will have food for a largely increased number of worms. Mulier, of Nevada City, has also been successful, as he always is. Nevada county will be well represented as to the silk business at the Mechanics' Institute Fair and the State Fair.

## POPULAR LECTURES.

[Concluding address before the MECHANIC ARTS COLLEGE. By Rev. Horatio Stebbins. Reported expressly for the PRESS.]

### The Theory of Common Schools Established by the State—Some Misconceptions, Social, Secular and Religious, Concerning Them.

You are, said the lecturer in commencing his address, not merely pupils of nonage, but you are citizens on whom the State imposes duties and obligations. Many of you are heads of families, and the education of your children becomes an object of increasing importance as they come forward to the responsible conditions of life. It may therefore be deemed not inappropriate to speak to you to-night concerning the principle on which our school system rests; for a clear conception of this places the citizen firmly on his feet.

#### The Principle on Which the State Supports Public Schools.

The Public School is founded on the well-established principle that Government may assume and exercise powers for the public good. This principle is identical with the very idea of civilized society, and is involved in almost all the benefits of social order. In the regulation of commerce, the coining of money, the building of roads and bridges, paving, lighting and cleaning the streets of a city, improving harbors, building light houses, establishing hospitals and asylums, levying taxes and military service, Government displays its power for the common good. It is not for individual good, but for common good. Government has no right to enforce what is best for the individual in his individual capacity, nor to seek the individual welfare save only indirectly through the common welfare.

Popular ignorance is the deadly foe of freedom. Liberty has gained power and place on earth through the growth of intelligence. Ignorance is fit only for oppression, tyranny and wrong. Freedom lays positive duties which ignorance cannot perform. Therefore ignorance is an injury to the State; it is garbage in the streets of the city, it is an impassable road in the country, an epidemic, a nuisance. By a principle as plain as that by which the Government compels the unhappy victims of contagion to be cut off from society, or sweeps the streets, or builds bridges, it may require that ignorance be removed. It has nothing to do with ignorance as it affects the man himself, but as it affects the common good.

Thus the State, imposing obligations which intelligence alone can discharge, is bound to supply the means of the intelligence, on the same ground that, requiring military service, she is bound to furnish implements of war. Therefore the State establishes schools and offers the advantage to all. The only thing needed to carry out the principle and interest of the State is a provision, already made in some portions of the country and attracting attention everywhere, against neglect and truancy, requiring that all children not provided with the means of education by their parents, shall attend the public schools. This would complete the system.

#### Immense Social Value of Public Schools.

Thousands have no conception of the real foundations of the public school, or of the rights of the State, and feel that education, being free to all, is free to be let alone. And this opinion is not confined to any one class or condition of society. There are those who feel that they are at liberty to allow their children to grow up in ignorance, if they choose. Whereas the theory of a free State is, that ignorance is a perpetual standing menace to the public welfare, a social and political nuisance, a dead obstruction to the peace and dignity of the commonwealth. Omitting altogether the relation ignorance has to crime, outrage and violence, it is incapable of discharging the positive duties which the State enjoins upon its citizens. The immense social value of the public school, when carried forward to realize the principles upon which it is founded, is not easily comprehended, because its results are remote and not exclusively material. But it is no exaggeration to say that the Board of Health cannot so promote the public welfare as the Board of Education. Ignorance is only a more intellectual nomenclature for the most pestiferous conditions of sewage, nuisance and miasma. The reply of thousands of men of the highest educational experience, of different sects and professions, to questions propounded by Horace Mann as to the result of the highest development of the common school system, with the best teachers and the attendance of all children during the years appropriate to pupilage, was, that if the system should be thus developed *not two per cent.* of the rising generation of the people would fail to be good citizens.

#### Public Schools are Not Charities.

There is another fallacy. We sometimes hear the public school system spoken of as a charity, and the man who has no children contributing to educate other people's children. It is no more a charity than is a bridge, or a road, or a street lamp. There is a superficial yet specious statement that runs like this: "A is a man of property without a family; B is a man of family without property. Why should

A pay taxes to educate B's children?" For the same reason that he should pay taxes to light the city. And it is not for B's children in either case, but for the common good. It might just as well be said: "Why should B, who does not keep a carriage, pay taxes to pave a street for A, who does keep a carriage, to drive on?" Taxes are moneys exacted from property chiefly to pay the expenses of social order. The chief expenses of social order are for the protection of the rights of property. Therefore it is just that property, and not persons, should pay the taxes. And it is no more unjust for a man without children to pay taxes for the schools, than it is for a man without a carriage to pay taxes for the streets.

#### Religious Education in Public Schools.

As is most natural and to be expected, a warm discussion, arising chiefly with the Roman Catholic church, is now going on with regard to the religious character of the public schools. Although there is at present a full in the discussion, it is not to be assumed that the questions involved are decided.

The ground of the Catholics is, that all schools ought to have religious education connected with them; that a school of any kind in which religion is not taught, is a godless school. Holding these views (and some other sects hold similar ones), they claim that the moneys raised in the State for public schools ought to be divided among the sects; or, at least, that those who insist on religious education should be allowed their share. This amounts to breaking up the present system and establishing another which may be properly called the sectarian system.

#### Religious Education Does Not Belong to a Public School.

The true correction for this and the proper reply are found in what I believe to be the fact that the public school is not, never should have been, and never should be, a religious institution at all. With the progress of liberty, the State exists independently of the church. Its purpose is to make intelligent citizens, not Christians. This latter is a matter of private, domestic conscience. All religious instruction should be left to the family, the Sunday-school and the church. This is best for religion itself. Nothing produces indifference more surely than the attempt to force religion in mechanical and unnatural methods. And it is unwise and unjust to enforce doctrines on those who object to them. As to calling the school godless because the Bible is not read there, you might as well call your place of business godless because the Bible is not read there.

Religion is a home sentiment, and not of the school. God himself has seemed to make this distinction in the very frame of our being and our earthly lot. All cannot teach their children intellectually, but all can teach them religiously. Religion is not taught by exact methods, but by divine influence, the temper and spirit of a household, a mother's loving care. A boy cannot have his business training in his father's house, nor his religious training in the public school. To turn children out into a public school to be taught religion is heaving them of their birthright and heavenly privilege.

#### Secular System Financially Impossible.

Let us see what this demand means. The State is required to divide its moneys among the religious sects under the specious plea that it tolerates all and cherishes all. I emphasize that: *tolerates all and cherishes all.* But this tolerant condition defeats itself, inasmuch as it diffuses and dissipates the public money and so increases the expense of education, by increasing the number of educational centers, that practically very many would be deprived of their benefit. And who is to determine about the sects? Even within the limits of Protestantism, what standard would you erect to determine the rights and apportion the funds to the religious classes of society? The State could not give the sects money enough to make a school for each one. The distribution of the public moneys among the sects is an absurdity. It cannot be done.

#### Secular System Means Church and State.

But suppose that society would divide into simply Protestant and Catholic, which is really what is wanted. Suppose that the Romanist should be let off on religious grounds and take with him his share of the funds. What does that logically end in? Here is a school, and a system of schools, supported by the State on religious grounds; that is, endowed by the State. If a school may be endowed by the State on religious grounds, then a church may; and if a church may be, then a priesthood may; and that all together means Church and State. There is no logical middle ground between a school thus sustained and the hierarchy thus sustained. To suppose that the American people intend to do any such thing, or make a beginning of any such thing, seems quite absurd, when England is trying to relieve herself of that incubus after an experience of centuries.

And look at it on other grounds. It is proposed to instruct on the church theory. The State and all good citizens whose money is thus expended, have a right to enquire into the ability and fitness of the church to educate persons. The church has never made a free State. Those countries now most directly under her influence display no particular fitness for popular liberty. American citizens may certainly be excused not only for their unwillingness to set up this power of the medieval time here in the new world and the modern age, but for their suspicion of its sympathy with freedom.

## • GOOD HEALTH.

## Dyspepsia.

This is the scourge, perhaps the sin, of the American people. It is caused, in the most common cases, by eating improper food, in improper quantities, and at improper times. O. P. Ford, of Oswego, New York, gives his experience in the case, which may be made a benefit to some who are suffering from this terrible complaint. He says:—"Many of the pies, the cakes, and the puddings we take into our stomachs, if spread on the outside, would cause a blister; and still, to please the palate, we take them down, and expect to enjoy good health? The stomach grinds on, and continues to work over this unhealthy mass of food, until it gives out, and we call it dyspepsia.

"Now, then, when the digestive organ becomes thus weakened, blistered, and sore, the best thing to be done is to poultice it on the inside by eating, slowly, something that will soothe and heal. This may be bread and milk; corn starch, boiled in milk; eaten with a little cream and sugar; boiled rice and milk; eggs cooked in water, and rarely done; and, if the bowels are sluggish, bread made from Graham flour must be used, and all irritating substances must be avoided. No liquids should be used while eating, such as tea or coffee, as all fluids weaken the gastric juice of the stomach.

"I have received," concludes Mr. Ford, "the greatest benefit from a bandage wet with cold water, laid on my stomach every night. It may be applied by taking a linen towel and doubling it in size, to cover the stomach and region of the liver, wetting it in cold water, and wrapping a dry one over it. This treatment must be persevered in; for we did not take the dyspepsia in a day, neither can it be cured in a day."

Some of our friends are suffering much with dyspepsia. The remedial agents recommended by one who has been "a fellow sufferer," are easily obtained; and as they have been successful in curing one case, they may be in others.

## Good Health as an Element of Success.

It is no exaggeration to say that health is a large ingredient in what the world calls talent. A man without it may be a giant in intellect; but his deeds will be the deeds of a dwarf. On the contrary, let him have a quiet circulation, a good digestion, the bulk, the sinews of a man, and the alacrity, the untinking confidence inspired by these, and, though baving but a thimbleful of brains, he will either blunder upon success or set failure at defiance. It is true especially in this country, that the number of men in whom heroic intellects are allied with bodily constitution as tough as horses—is small; that in general a man has reason to think himself well off in the lottery of life if he draws the prize of a healthy stomach without a mind, or the prize of a fine intellect with a crazy stomach. But of the two, a weak mind in a herculean frame is better than a giant mind in a crazy constitution. A pound of energy with an ounce of talent will achieve greater results than a pound of talent with an ounce of energy. The first requisite to success in life is to be a good animal. In any of the learned professions a vigorous constitution is equal to at least fifty per cent. more brains. Wit, judgment, imagination, eloquence, all the qualities of the mind, attain thereby a force and splendor to which they could never approach without it. But intellect in a weakly body is "like gold in a spent swimmers pocket." A mechanic may have tools of the sharpest edge and biggest polish; but what are these, without a vigorous hand and arm? Of what use is it that your mind has become a vast granary of knowledge, if you have no strength to turn the key?

## Carpets, Dust, and Disease.

The course of recent inquiry into the causes of morbid states has rendered it more and more probable that the active causes of various maladies exist extensively diffused through the atmosphere, and having immediate access to the blood through respiration, become efficient sources of vital derangement. Hence the attention lately given to what is termed the "germ theory of disease," and the confirmation that has been lent to this view by Professor Tyndall's phrase, "dust and disease." Professor Tyndall calls attention to the efficiency of a mass of cotton fibres

placed before the mouth to strain out the atmospheric dust; and this property of fibrous or textile masses to separate and retain the floating impurities, suggests that carpets must exert a more or less harmful influence upon health. That they are traps and reservoirs of dust everybody knows; and it is notorious that they often become so foul that every step charges the air with their emanations. In this period of household changes it is well to remember that, although carpets are not perhaps absolutely dangerous to life, yet they are unhealthy than matting, and that naked floors are healthier than either.—*Galaxy.*

## Evils of High-Heeled Boots.

The high heels which it is now the fashion to put on men's, women's and children's shoes and boots, is beginning to attract considerable attention, from their numerous injurious effects. The practice is openly condemned by learned surgeons, and Dr. Wm. H. Pancoast remarked the other day, after performing a painful operation on an interesting little girl, whose feet had been ruined by wearing wrongly constructed shoes, "this is the beginning of a large harvest of such cases." And what else can be expected? Mothers walk the streets with heels on their boots from two and a half to three and a half inches high, and not more than an inch in diameter, and their daughters follow the same bad and barbarous practice. In many cases severe sprains of the ankles are suffered. But these are not the worst fruits of the high heel torture. The toes are forced against the fore part of the boot, and soon begin to assume unnatural positions. In many cases they are actually dislocated. In others the great toe passes under the foot, the tendons barden in that position, and lameness is contracted, for which there is no cure but the knife. When the injury does not take this form, it assumes other aspects almost as horrible, and it is high time society should set its face as a flint against any continuation of the absurd and unnatural custom.

## More About the Oleander Poison.

We made mention, a few days since of the fact that the Oleander, so common and popular in our gardens, was a very poisonous plant. We have since met with the following paragraph in the last number of *Tilton's Journal of Horticulture*, in further relation to this matter:—

The oleander is classed by botanists in the Dogbane family, of which many of the species are acrid-poisonous. Phillip Miller, of the Botanic garden, Chelsea, England, marks in his *Gardener's and Botanist's dictionary*, that "oil in which oleander leaves are infused, is recommended in the itch and other cutaneous diseases, in preference to mercurial preparations for children and delicate constitutions; but that the leaves are acrid and poisonous, and therefore not proper to be used internally without great caution. The branches, when burnt, emit a very disagreeable odor." Even the odor of the flowers, when inhaled in close rooms, sometimes produces very unpleasant effects.

The remedies for this poison on such as are commonly used for narcotic and acrid poisons.

TREES OUT OF PLACE. Trees are out of place when they over-shadow the roof of a house or darken its windows. No small part of the sickness of families is attributable to the shading of dwellings by overhanging trees and thick clustering vines. Our bodies need light, pure sunlight, and a great deal of it, and our spirits need it none the less; and he who shuts out this genial dispenser of health makes a great mistake, and does a great wrong. All medical testimony is concurrent upon these facts.—*Ex.*

LIGHT IN THE SICK CHAMBER.—The quantity of light admitted into the sick chamber is a matter of immense importance to its suffering occupant. As light is an element of cheerfulness, it is on that account desirable that as much should be admitted as the patient can bear without inconvenience. The light should be soft and subdued and not glaring. Care should be taken that bright, lustrous objects, such as crystals and mirrors, should be kept out of sight.

THE waters of Lake Michigan now flow through the formerly filthy Chicago River into a canal and thence to the Illinois River. An important sanitary fact for Chicago.

Patent Fly Trap, Ill.; Elastic Car Wheel, Ill.; Mechanic Arts College; Yellow Fir for Ships.....	41
To Cool Water; Soap; Tanning Leather; How Much Bread a Barrel of Flour Makes.....	42

**THE STRIKE AT AMADOR.**—The troops have returned from Sutter Creek and affairs have been adjusted. The terms of agreement are,—that the rates of wages shall be \$2.50 and \$3 for underground work, and such prices for top men as may at the time of employment be agreed upon; and that no Chinese shall be employed. It is a matter of congratulation that affairs have been settled. Should in the future any causes of disagreement arise, we hope that these may be amicably discussed and adjusted without any actual rupture between the parties.

## Important Railroad Rumors.

Various rumors have been afloat during the past few days, to the effect that the Central Pacific has bought out the California Pacific Railroad. The suspension of work on several branch roads of the latter company, and the coincident departure of Messrs Latham and Stanford for New York have given rise to much speculation.

There is another rumor that the Pennsylvania Central has purchased both of the above named roads.

We have no definite facts to give in the matter, and the first positive knowledge, should the reports turn out true, would be the announcement of the completion of some bargain on the part of the companies. We notice, however, that advertisements have been withdrawn from the papers for the Yosemite routes, and give the item for what it is worth.

If the reports turn out true, either way, some of our projected railroads will not be completed just at present.

## Contributions From Japan and China.

Mr. H. D. Dunn, agent for the Industrial Fair, has brought 170 packages of most varied description from Japan, and 19 packages from China, making a total of 60 tons. These will make a fine showing. The next steamer will bring 20 to 25 tons additional. The Japanese Government has appointed a special committee of nine, who are now in the city, who will report on the Fair, and on our agricultural, mining and manufacturing industries.

In order that the public may form some idea of the variety and extent of the proposed exhibit, we append the following list furnished the Institute by Mr. Dunn:

Flax in its raw state.  
Flax in various stages of manufacture.  
Vegetable Tallow in its raw state.  
Vegetable Tallow manufactured into wax and other articles.  
Coal.—Sample lumps of the different varieties in Japan.  
Iron Ore.—Samples of the different qualities in Japan.  
Iron in pig and in various forms, as rod, bar, sheet and plates.  
Steel, cast and in bar and other shapes.  
Copper Ore.—Sample specimens.  
Copper in pig and in bar, rod, sheet and other forms.

Lacquer and Varnish Gums.—Samples of the various kinds.  
Oils of vegetable and mineral production.  
Lacquer varnishes of the various kinds used.  
Tools used by carpenters, stone masons, blacksmiths, plasterers and farmers.  
Mating in rolls of various kinds. Also mat clothing used against rain.  
Cotton in its raw state. Also seed of same.  
Cotton manufactures, say in thread, piece and smaller articles.  
Silk, raw, dross, reeled ready for manufacture.  
Silk in skeins and woven in different ways.  
Also silk garments.  
Paper, all varieties made.  
Paper stock or materials from which the various kinds of paper are made.  
Bamboo Work, all the various kinds of manufacture, viz.: basket work, carvings, thread work, wove and spun work.  
Lacquered ware in all its varieties.  
Porcelain ware in all its varieties including inlaid and enamelled ware.  
Fans.—An assortment of the different kinds made.

Ivory Carvings.—An assortment showing skill in workmanship.  
Crystal Work.—Plain stones, also mounted in gold and silver jewelry.  
Bronze Work.—Plain, carved and inlaid with other metal and enamelled.  
Bird cages of bamboo and other material.  
Fishing tackle, lines, etc.  
Colors in lacquer and in a dry state.  
Brushes, armor, Japanese war weapons, ancient and modern.

Cutlery.—From swords to the smallest articles made.  
Leather.—In skins of all kinds made.  
Leather Manufactures.—All varieties.  
Sugar in its raw and refined state.  
Tobacco in the leaf and manufactured states.  
Umbrellas, lanterns, mirrors, costumes, hats, shoes, musical instruments, kites, toys, etc.  
Wheat and other grain, dry vegetable produce, flour.  
Fruits dried and preserved.  
Stons suitable for cutlery and lithographic purposes.  
Mineral specimens and curiosities.  
Coins.—Specimens of ancient and modern dates.

Carvings in wood and stone.  
Tea.—Specimen boxes of various kinds.  
Tortoise shell work in all its varieties.  
Fine metal castings, bells, copper smith work.  
Glass work in its varieties.  
Woods used for cabinet and furniture purposes.  
Screens, ornamental and useful.

## University of California.

### Meeting of the Regents.

The annual meeting of the Board of Regents was held on Tuesday, July 18th. In accordance with the recommendation of the Faculty, it was voted to confer the degree of Bachelor of Arts on F. H. Whitworth, E. W. Blaney, G. D. Cobb, C. B. Learned and E. B. Pomeroy, of the graduating class; and the degree of Master of Arts on J. R. Glascock and G. E. Sherman of the class of 1865, C. A. Garter and W. D. Harwood of 1866, and W. Gibbons and M. P. Wiggins of 1867.

Reports were received from Prof. Carr; on the Medal Fund (which now amounts to \$1,976), the proceeds of which are to be applied annually for a medal for the most distinguished student of the year; of the Land Agent; of President Durant, on the condition and wants of the University; and on

the Preparatory Department.

The Regents resolved to attend the Commencement exercises in a body.

### Commencement Day.

Wednesday was Commencement Day at the University at Oakland. A procession was formed at 10 A. M., received the guests from San Francisco at the railroad station, and escorted them to the Music Hall.

The following was the order of exercises here:

1. Music—Invocation, by Rev. Dr. Thomas.
1. Salutatory Oration (in Latin)—Edward Wellington Blaney, San Francisco.
2. "The Growth of the Democratic Principle"—Everett Benedict Pomeroy, Oakland.
3. "The Limits and Progress of Knowledge"—Charles Burt Learned, Oakland.
4. "A Student's Retrospect"—George Downes Cobb, San Francisco.
5. "A Defense of Doubting"—Edward Wellington Blaney.
6. "Columbus and the Genius of Discovery," with the Valedictory Address—Frederick Harrison Whitworth, Seattle, W. T.
7. The University Oration—His Excellency H. H. Haight, Governor of California.
8. Poem; by Miss Ina D. Coolbrith; read by Rev. H. Stebbins, DD.

Degrees were then conferred as per vote of Regents above.

### Alumni Meeting.

The meeting of the Alumni of the Pacific coast was held at 3 P. M. This association comprises the alumni of all colleges, who are resident on the coast. President J. B. Felton presided. An election of officers resulted as follows: President, J. G. McCullough; Secretary, Prof. M. Kellogg; Executive Committee, E. Tompkins, J. W. Dwinelle, O. P. Fitzgerald. Several honorary members were elected. Rev. G. Ames, of San José, delivered the oration. The meeting then adjourned to Brayton Hall to partake of the dinner given by the Regents. Toasts, speeches and songs followed in quick succession, and then the meeting broke up after singing Auld Lang Syne.

## A Valuable Dovetailing Machine.

The Heath dovetailing machine, patented by Elander Heath in 1870, and since improved by Mr. S. W. Shaw, is now on exhibition at B. H. Freeman's stair building establishment on Mission street near First. The device is certainly a most valuable one.

In its improved form, there is a cone, made up of a number of frusta, or parts of the cone, so arranged as to hold most securely a set of cutters, and allow of their easy placement or removal. Over this cone is a guide, inclined at an angle to the horizontal, for holding the boards, which is moved over the revolving cutters. This part of the device is for cutting the mortises. For cutting the tenons, a cylinder is used in the place of the above mentioned cone, and the guides are at an angle to the axis of the cylinder.

The machine originally had saws, but now has cutters. The advantage is that the cutters can be sharpened with great rapidity—in much less time than the saw teeth, being fewer in number. Again, as they are sharpened on the under side, there is no difficulty about gauging them to cut the proper depth. When properly gauged at the commencement, they will not lose over one sixty-fourth of an inch in all until completely worn out, and they will last with ordinary care for many years. The cutters are arranged in two spirals, of 9 cutters each, on the cone or cylinder. By means of a light frame placed over the guides, blind dovetails for drawers, etc., can be readily cut.

This machine has been used for eight months at the Box Factory of Swan, Dunbar & Co., 114 and 116 Spear street. Driven by 3-horse power, with one man's attendance, it will do the work of 20 men at least, as Mr. Swan has assured us.

We are very much impressed with the value of this device. Mr. Shaw proposes to introduce it now at the East. Persons here can see the machine, and learn further particulars, by applying to Mr. Swan at his factory, as above.

**EARTHQUAKE.**—A severe shock of earthquake is reported as felt at the Joe Walker mine, Kern country.

## California Mines and English Capital.

The London *Times* attempts to show the dangers of investing capital in the mines of our country, and succeeds in showing that it knows nothing of the actual condition of affairs, and that its prejudices against the United States render it incapable of drawing any logical conclusions on the subject. Starting on a foundation of gross ignorance, and building up its articles in blind prejudice, it succeeds in erecting a most pitiable monument of journalistic nonsense. The gist of its remarks is that there are no paying mines here, and that all American (or, at least, Californian) miners are swindlers.

The *Times* has just so much reason for its remarks, viz: that some dishonorable schemes have been gotten up here to catch English capital, and that some dishonest people are concerned in mining. But this is no argument at all against mining itself. The same may be said against any country, people or occupation. J. Ross Browne has written a letter to the *Times*, which effectively answers it, and in reply to which that paper has but lame remarks to make. He speaks of the yield of our mines and of the profits of mining investments. He says that in twenty years' experience on our coast, he has not learned of half a dozen cases in which British capital has been sacrificed by fraud, "and in those cases which have occurred, I venture to assert that the guilty parties do not all reside on the Pacific coast."

We quote the following from Ross Browne's letter, as it touches on a point on which considerable stress has been laid. He says:

"Why do you come here for capital? is a very common question. If our mines are so productive, why not enjoy the profits of them ourselves? Let me answer these questions Yankee fashion. If you can get four per cent. a year at home for your money, why invest it in foreign securities? If your domestic investments are so much safer, why not enjoy them? Because you do not get enough at home for your money, and we come here because we have to pay too much at home for our money. The last number of the San Francisco *Scientific Press* says: 'On this coast a mine is not considered a success unless it returns the enormous dividend of five per cent. a month—at least, our capitalists are unwilling to invest at lower rates.' The truth is, they have not the capital to invest; the demands for capital to open up good mining properties are far greater than the supply. As long as the superficial deposits lasted, expensive machinery and skilled labor were not required; but quartz mining requires both, and we are compelled to seek for capital to secure them where it is most abundant. Many excellent mines, capable of producing two or three per cent. a month upon a given capital, remain idle because the owners have gone as far in opening them as their means will permit, and cannot borrow money, even at five per cent. a month, to erect the machinery necessary to work them with profit. It is a great mistake to suppose that because an enterprise is promising or a property valuable, there can be no good reason for disposing of it. Such logic would put an end to all exchange of commodities, all traffic between individuals, all intercourse between nations. I contend that no business, judiciously conducted, is more profitable than mining."

**SMITH TRUSS BRIDGE.**—This bridge appears to be ever increasing in popularity, and we often see the highest testimonials in its favor. Not only are they extensively used in the "Western States," but they are also adopted on the Atlantic and Pacific coasts. The bridges over almost all the rivers in Nebraska have been built by the Smith company. After a most searching comparison, the Atlantic & Lake Erie Railroad have adopted the Smith Truss for all the bridges over their line. The company is said to have the most extensive works of the kind in the United States at Toledo, Ohio. The Pacific Bridge Company at Oakland, Cal., are the agents for this coast, and we recommend an examination of their plans.

### A Patent Fly Trap.

The simple device herewith illustrated is the invention of Mrs. Farnan, of Indiana, and is known as the "Hoosier Fly Trap." It was patented January 31st, 1871, and is one of the list of useful devices of which it may be truly said, that "necessity is the mother of invention," for we are quite sure that the lady patentee was vexed by both the troublesome flies and the unsatisfactory appliances for destroying them patented by male inventors by the thousand, all of which had failed of entire success.

The device is very simple, as our cut shows. Its basis is merely a tin dish with several corrugations formed in the rim, so that when the round wire screen is set into it, openings are left for the flies to enter, as shown near the arrow point. The bait is placed on the bottom in the center, and the flies attracted in, after eating, naturally fly upward towards the light, and pass through the small opening at the apex of the inner cone into the outer cylinder and are trapped effectually, and may be "mercifully destroyed" by boiling water, or they may be mashed or starved to death at the pleasure of their captor. Over one quart at a time have been caught by the patentee for this State, T. B. Hopkins, No. 244 Sixth street, in this city. Several thousands of the little pests may thus be hived in a batch.

For bait, bread soaked with sugar and milk will answer, but it is more attractive when lager beer is used with sugar or molasses. The best bait, however, is considered to be sawdust mixed with molasses and lager beer, and we would advise all humanitarians to give the flies their choice for their last meal. The trap is retailed at the reasonable price of \$1.25, or four for \$5, and at favorable rates to dealers. It may be had at the number above stated, where rights for territory in California are also for sale.

### A Good Move.

Messrs. Vale & Warner of the S. F. Employment Office, 230 Sutter street, are seriously at work getting immigrants who will go to work on farms. It is difficult to find persons in the city who are willing to accept such situations. Messrs. V. & W. have a branch office in Scotland and propose establishing one in England, and their efforts are directed mainly to getting farm laborers, a class which we need most of all out here. They can draw from a healthy and industrious population, and we wish them success. Mr. Vale informs us that he will have here, before next Christmas, one hundred good farm hands. Such an institution as his is capable of doing our coast a very great benefit.

**YELLOW FIR FOR SHIPS.**—Letters to the Secretary of the Treasury, Hon. G. S. Boutwell, from T. G. Phelps, Collector of the Port, R. H. Waterman, U. S. Inspector of Hulls, and C. T. Hopkins, Secretary Board Marine Underwriters, all of this city, have been published. They all praise Puget Sound Yellow Fir for ship building in comparison with any other wood, as light, strong, cheap and easily worked, and as obtainable of any length up to 120 or 130 feet and of almost any required dimension. It is likewise of very considerable durability; and all the writers concur in the statement that, if preserved, it must be considered one of the very best ship building materials in the world.

Boston has a palace street car.

### The Excelsior Elastic Car Wheel.

For a long time the ingenuity of inventors has been taxed to produce a car wheel which should have a certain measure of elasticity while retaining a proper amount of rigidity to carry the car with safety. The advantage of the elastic system of wheels having been long ago demonstrated, its value in preserving the axles from the granulating effect of the jar and in relieving the truck from the heavy hammering in fast motion, nothing remained but to devise the best form for the wheel. We give herewith cuts of one of the latest and most simple forms presented. The metal portions of the wheel consist of but three parts. These are so arranged as to enclose sufficient space for the rubber packing which is preferably of solid round rods, cut of the proper length.

The following description will render the construction plain: Fig. 1 is a trans-

Fig. 1.

Fig. 2.

Fig. 3.

THE EXCELSIOR ELASTIC CAR WHEEL.

verse section through the center of the wheel. Fig. 2 shows the wheel with the covering cap removed, showing the shape of the center-piece or hub and position of the rubber. The letters refer to similar parts in each of the figures. A, is a flanged center-piece, having something

THE HOOSIER FLY TRAP.

like the form of a four-rayed star, with the points rounded off. B, is the exterior portion of the wheel, separated from the center-piece, A, by the cylindrical rubber springs, C. A side plate, D, is pressed on to the axle, E, simultaneously with A, after having been made to assume its proper position by the bolts, F, passing through A and D. When thus bolted, it, together with the center-piece, A, compresses rubber rings, G, let into grooves formed in the exterior part of the wheel, B, and also compresses longitudinally the series of cylindrical rubber springs, C. The result is a wheel, elastic vertically and laterally.

The bolts, F, are only necessary to hold the parts in adjustment while the wheel is pressed on the axle in the usual way. They sustain no strain in use. Fig. 3

shows the wheel as completed and placed on the axle ready for use.

The points claimed for this wheel are these: It is as nearly noiseless as it is possible to make a wheel where an iron tread comes upon an iron rail. The wheel being elastic virtually puts springs under the whole of the weight, excepting only the thin strip of metal constituting the rim and flange. In an ordinary truck only a small part of the weight is supported on the springs, and the axle, one of the most vital parts, is exposed to the full force of the concussions when running over rough roads, or when running fast on the smoothest. The "Excelsior" wheel relieves the axle from the force of these shocks and vibrations by the row of elastic rollers which connect the hub with the rim of the wheel, and thus prevents the crystallization which they would otherwise induce.

Another point not to be lost sight of is the fact that when the rim of the wheel wears out so as to need renewal, it is unnecessary to take the hub off from the axle and replace it. Nor is a new wheel necessary.

It is only needful to remove a few bolts, take off the center-piece, remove the old rim and substitute a new one. The hub being as good as ever, there is saved, of course, the expense of the hub and the cost of boring out a new wheel. The wheel has a lateral elasticity which enables it to resist easily the tremendous side thrusts to which wheels are subjected. The circular ring of packing, G, receives the full force of the lateral shocks before they can be transmitted to any part of the hub or axle.

Should our readers desire any further information upon this subject, we would refer them to the Excelsior Car Wheel Co., 30 Vesey St, New York City, who, we understand, are now manufacturing and introducing these wheels.

### Mechanic Arts College.—Closing Exercises.

The course of lectures of the Mechanic Arts College was closed by appropriate exercises last Saturday. President Durant, of the University, presided, and made fitting remarks on the occasion, speaking of the advantages of such a course, and referring to the influence of the arts and sciences, of all education, on the solution of the great problem of the world, the social problem. He extended an invitation to the Mechanic's Institute to participate in the Commencement Exercises of the University on the 19th, and hoped that the class, having a right to join in these, would largely avail themselves of this right.

Rev. Horatio Stebbins, one of the Trustees of the University, then delivered a most excellent address on the Public School System of the United States, the principles on which it is founded, and some social, secular and religious misconceptions which exist in regard to it. The address was most valuable and interesting, and we commend to our readers the report of it which we give on another page. It was preceded and followed by remarks to the class in regard to the course of lectures which had now come to a close.

The class was then dismissed. One of

its members then called it to order again, and a meeting was organized with Mr. M. Lynch as President and Mr. R. Y. Hayno as Secretary. On proper motion, a committee was appointed by the President to draft resolutions of thanks. This committee was constituted as follows: Mr. R. A. Marden, Miss Kate Kennedy, Mr. S. H. Daniels, Mrs. M. F. Grover, Mr. J. P. Damron, Miss Jessie Smith, Dr. W. A. Grover, Miss J. Parker, Mr. P. F. C. Sanders and Miss Kate M. Atkinson. The committee reported the following resolutions which were adopted:

WHEREAS, The course of lectures provided by the Board of Regents for the students-at-large of the Mechanic Arts College of the University of California, has now terminated, and the class, which for nearly eight months has attended these lectures with so much satisfaction, improvement and pleasure, will to-night go out of existence, and the 500 members be separated and scattered; and as these lectures have been a constantly-recurring source of instruction and pleasure, their absence will create a void difficult to fill, and be a loss to that portion of the community they are intended to reach, and which we realize more fully now that the term is completed,

Resolved, That we, the students-at-large of the Mechanic Arts College, desire to express our warm gratitude to the Regents of the University of California, and our appreciation of the efforts made on our behalf, in furnishing, during the last eight months, the choicest mental food and the most delicate recreation, through means of the distinguished Professors of the State University and the Saturday evening lectures now terminated.

Resolved, That to the Professors of the University of California, for their patience and consideration to the class, occupying as they did a new and untried field, we are under deep and lasting obligations, and we consider that to them the success of these lectures are mainly due.

Resolved, That we desire to thank the Mechanics' Institute of this city for their hearty coöperation in the efforts of the Regents.

Resolved, That it is the sense of this meeting that the Regents, in adopting this mode of instruction, displayed a knowledge of the needs of the community, which gives us an assurance that the benefits of the State University will be extended in the broadest sense; that they are not unmindful of the needs of the people; and that the University established by the wisdom of the people represented in the State Legislature, and being still in its infancy, is deserving of the warmest sympathy and best wishes of the people; as its sphere of usefulness is large, its means should be equally so—and the Legislature should see to it that in its infancy it has a generous subsistence, that it be during its youth imbued with broad and generous principles—so that in its manhood it be may be liberal and great.

Resolved, That to the distinguished head of the University and President of the Faculty, Dr. A. Durant, at this moment of parting, we respectfully tender our kindest wishes and regards.

Resolved, That to A. S. Halladie, President of the Mechanics' Institute and Regent of the University, we respectfully tender our heartfelt thanks for the many acts of kindness he has shown us, and we will always remember that to his kind and watchful care we are indebted for many of the privileges we have enjoyed during our attendance at the Saturday evening lectures of the Mechanic Arts College.

The class then voted to be present in as large attendance as possible at the University Commencement, and to attend as a class. Mr. M. Lynch was elected Class Marshal for the occasion.

A vote of thanks to Rev. Horatio Stebbins for his able address was enthusiastically carried. The class then adjourned.

**PEARS FOR THE EAST.**—C. W. Read, of Washington, Yolo Co., shipped 10 tons of Bartlett pears East by the C. P. on the 19th, from his orchard. He ships 20 tons more on the 22d. They go in Booth's refrigerating cars.

## DOMESTIC ECONOMY.

### How to Cool Water.

At this season of the year a cool draught of water is a luxury which we may enjoy with a little care. By the following method, simple and inexpensive, water may be kept almost as cold as ice. Let a jar, pitcher or vessel used for water, be surrounded with one or more folds of coarse cotton, to be constantly wet; the evaporation of the water will carry off the heat from the inside, and reduce it to a low temperature. In India and other tropical countries, where ice cannot be procured, this expedient is common. Let every mechanic and laborer have at the place of his work two pitchers thus provided, and with lids or covers, one to supply water for the evaporation, and he can always have a supply of cold water in warm weather. Any person may test this by dipping a finger in water and holding it to the air on a warm day; after doing this two or three times he will find his finger uncomfortably cool. This plan will save the bill for ice, besides being more healthful. The free use of ice water often produces derangement of the internal organs; which, we conceive, is due to the property of the water independent of its coldness.

### Soap.

When you take up a small square of perfumed soap and lather your hands briskly with it, do you ever stop to think how hard it would be to get along without the cleansing agent? "How are you off for soap?" would become one of the most important questions of the day, if you were to have a soap-dearth as well as a coal famine. Yet the use of soap is not three hundred years old. We hear about the lily hands and the pure cheeks of the fair ladies of the days of old renown—but how in the world did these *belle dames sans merci* manage to keep their hands and faces so clean and sweet without any soap? The high-bred lords and ladies of the Middle Ages were compelled to resort to the free use of aromatic essences and oils to atone for a want of cleanliness; while the voluptuous Greeks dipped their garments into perfumed water. So we see that the world learned to be sweet before it learned to be clean. Just imagine that Tennyson's "Lily Maid of Astolat" never saw even so much as a cake of brown Windsor—not even a piece of homely rosin soap!—*Lake Side Monthly*.

**TO DESTROY FLYING MOTHS, ETC.**—For all moths, and beetles that fly by night, use fire to trap them. A fire of shavings, or any thing that will make a blaze, kindled in the evening, will destroy thousands. The more flame the better, if it does not scorch the leaves. A cheaper method still, is to take the half of an old sugar-hogshead, or any open vessel, with a broad surface, partially filled with water, and set a lighted glass lantern on a block or stone in the center of the water at night. The moths are attracted by the lantern and its reflection, and fall into the water. The advantage of the sugar-hogshead is, that it serves for a trap by day as well as by night. For moths that fly by day, take wide-mouthed bottles, half fill them with sweetened water, and vinegar, and hang them in the trees, changing the liquid weekly. Thousands of insects are drowned.

**HOW TO CLEAN FLOORS.**—Office floors darkened by dirt may be satisfactorily whitened at the spring cleaning by washing with hot ley of caustic soda to remove any grease, and when nearly dry, moistening with very dilute hydrochloric acid, and then with a thin paste of hypochlorite of lime, left on over night. When washed off in the morning, the whiteness of the floor will be equally surprising and delightful. Stone house fronts are cleansed by throwing against them a jet of water under steam pressure. This method is cheap, and does not injure ornamental parts. Aside from the clean and fresh appearance thus secured, it is calculated that if all the walls of the buildings in London were kept clean, instead of being grimy and dark from top to bottom, a gain would be obtained of half an hour of daylight out of every twenty-four.

**TANNING LEATHER.**—It is often a matter of both convenience and economy in the household or on the farm to be able to do a little tanning; so we give here an approved receipt which may prove useful to some one who is not acquainted with it: "Soak the skin or hide eight or nine days in water, then put it in lime; take it out, and remove the hair by rubbing it, and soak it in clear

water until the lime is entirely out. Put one pound of alum to three of salt, dissolve in a vessel sufficiently large to hold the hide; soak the hide in it three or four days, then take it out, let it get half dry, and then beat or rub it until it becomes pliable. Leather prepared by this process will not do so well for shoes, but answers well for ham strings, back hands, and various other purposes on the farm.

### How Much Bread a Barrel of Flour Will Make.

They have had a bread controversy in Washington City. Some weeks ago fault was found with the bakers for raising the price of bread; and, a practical baker taking the ground that bread could be made for five cents a loaf, while others claimed it could not; to settle the matter it was arranged that three barrels of flour should be purchased and baked at the government bakery the officer in charge to be the arbitrator. The result was a yield of 560 pound loaves of bread to the barrel. This, it is stated, is at variance with the past experience of the Washington bakers, who have not been able to obtain more than 250 pound loaves from the barrel in the regular course of business.

### Pickling Green Corn.

This is a much cheaper method of preparing corn to be used in winter in a fresh state, than that of canning it: When the corn is a little past the tenderest roasting-ear state, pull it; take off one thickness of the husk, tie the rest of the husk down at the silk end in a close and tight manner; place them in a clean cask or barrel compactly together, and put on brine to cover the same of about two-thirds the strength of meat pickle. When ready to use in winter, soak in cold water over night, and if this does not appear sufficient, change the water and freshen still more. We have used corn prepared in this way for two seasons, and it is excellent; very much resembling fresh corn from the stalk.—*Ec.*

**TO FLAVOR TOBACCO.**—This is done by a mixture of one part each of lemon peel, orange peel, figs, coriander seed, and sassafras; one-half part each of elderberries, and cinnamon; two parts of saltpetre, three of salt, and four of sugar. This mixture must be digested in fifty parts of water, and, before applying it, flavored with an alcoholic solution of gum benzoe, mastic, and myrrh. It is said that this decoction gives a flavor to common leaves resembling closely the Porto Rico; but to this end the leaves must be well dried, about a year old, well permeated with the preparation, kept in a pile for eight days, turned daily, and finally dried.

**TO KEEP MILK SWEET.**—A teaspoonful of fine salt or horse-radish, in a pan of milk will keep it sweet for several days. Milk can be kept a year or more as sweet as when taken from the cow by the following method: Procure bottles, which must be perfectly clean, sweet, and dry; draw the milk from the cow into the bottles, and as they are filled, immediately cork them well, and fasten the cork with pack-thread or wire. Then spread a little straw in the bottom of a boiler, on which place the bottles, with straw between them, until the boiler contains a sufficient quantity. Fill it up with cold water, and as soon as it begins to boil draw the fire and let the whole gradually cool. When quite cold, take out the bottles and pack them in sawdust in hamper, and stow them away in the coolest part of the house.—*Southern Farmer*.

**PEA-SAUSAGE.**—The *Vallejo Chronicle* says that a citizen of that town has on exhibition a pea-sausage, which is a specimen of the condensed rations carried by the Prussian soldiers in their late campaigns. It is made of the condensed juices of beef and pea flour, and in that shape a soldier can carry enough for thirty days substance without inconvenience. Our own Government will test the new rations among the troops in Arizona.

**MENDING TIN PANS.**—A correspondent of the *Rural New Yorker* says: "Tell your lady readers to mend their tin pans with putty. It is very easily done, and is much better than to throw them away. Put it on the outside; let it thoroughly dry, and they will never have to mend that place again. I have them that I have used for twenty years."

**TOMATOES.**—With meat, raw, should be sliced up in vinegar, salt and pepper, like cucumbers. For tea, use sweet cream and sugar; they are almost as good as strawberries.

## Eastern Advertisements.

## WALTHAM WATCHES.

In soliciting anew the public patronage of WATCHES of domestic production, the AMERICAN WATCH  
COMPANY respectfully represent—  
That no fact in the history of manufactures is more completely demonstrated than that the best system of  
making Watches is the one first established by them at Waltham. That system always had the warrant of reason  
and common sense, and now the test of time in the trial of the Watches themselves cannot be denied to have been  
ample and satisfactory. It is admitted on every hand—the evidence of daily observation and common reputa-  
tion—that the Watches not only keep correct time, but that as machines they ENDURE. It should seem that nothing  
more is needed, but that their sizes, shapes and appearance should suit the tastes of the people. As to all these  
conditions the American Watch Co. are now fully prepared to answer the exactions of the market. They con-  
fidently assert there is no longer any need for such reasons to import watches of any description whatever. Every  
size in ordinary demand, every shape and every variety of finish and decoration, may now be had. And as to  
price, the recent reductions leave no room for doubt that the Waltham system of Watch-making is

The Most Economical as well as the Most Reliable,

And that the Waltham Watch is the Cheapest as well as the Best.

Many new varieties of movements have been added during the last year, all of which display the Latest Im-  
provements in design and finish, and evince the rapid progress the Company is making toward perfection in the  
art. Among these the new small size Watch, for Boys and young gentlemen, is to be specially noted. A very  
low price has been made for this Watch because it is a boy's watch, and with the object of bringing it within the  
means of boys of all classes. Price being considered,

No such Watch, in Quality and Beauty,

Has ever, in any country, been produced.

The "CRESCENT-STREET" FULL PLATE WATCH, added during the last year, is now made either with  
or without stem-winding and setting attachment. This Watch, in either form,

The Company Challenges all Manufacturers of all Countries

To heat or equal for its price. It is made with all the latest improvements in every part—improvements which  
insure to be the only good SAUCE. The success of  
this most delicious and  
unrivalled Condiment  
having caused certain  
dealers to apply the  
name "Worcestershire Sauce" to their  
own inferior compounds, the public is  
hereby informed that the only way to  
secure the genuine is to ask for LEA &  
PERRINS' SAUCE, and see that their names  
are upon the wrapper, labels, stopper and  
bottle.

"American Watch Co., Crescent Street."

Counting on such destination for this variety of their manufactures, the company devote the greatest care to its  
construction, employ upon it only their best men and best machinery, and issue it with their reputation at stake  
upon its success.  
For sale by all leading jewelers. No Watches retailed by the Company. For all other facts address

## ROBBINS & APPLETON,

General Agents for American Watch Company, No. 1 Bond street, New York.

13t-3a

## LEA & PERRINS'

CELEBRATED

## Worcestershire Sauce.

Declared by Connois-  
seurs to be the only good  
SAUCE. The success of  
this most delicious and  
unrivalled Condiment  
having caused certain  
dealers to apply the  
name "Worcestershire Sauce" to their  
own inferior compounds, the public is  
hereby informed that the only way to  
secure the genuine is to ask for LEA &  
PERRINS' SAUCE, and see that their names  
are upon the wrapper, labels, stopper and  
bottle.

Soms of the foreign markets having  
been supplied with a spurious Worcester-  
shire Sauce, upon the wrapper and labels  
of which the names of Lea and Perrins have been  
forged, L. and P. give notice that they have furnished  
their correspondents with power of attorney to take in-  
stant proceedings against manufacturers and vendors of  
such, or any other imitations by which their right may  
be infringed.  
Ask for LEA & PERRINS' Sauce and see name on  
wrapper, label, bottle and stopper.  
Wholesale and for export by the Proprietors, Worces-  
ter; Crosse and Blackwell, London, &c. &c., and by  
Grocers and Oilmen universally. Agents, CROSS &

The Prices are now all Reduced!  
SOLID SILVER HUNTING WATCHES as low as \$15.  
SOLID GOLD HUNTING WATCHES as low as \$65.

Our Prices are all in Greenbacks, and we deal in none  
but GENUINE WALTHAM WATCHES.  
Every one who wants a Watch or feels a desire to be  
posted, should write to us for our Illustrated History of  
Watchmaking. It will cost you nothing, as we send it  
postpaid without charge, and with it a full Catalogue of  
all the Watches with prices of each. When you receive  
this you will be surprised at the low rates, and you will  
then understand our plan of sending Watches to any  
place, however remote, without any risk to the pur-  
chaser.  
We send any Watch you order, and let you examine it  
before you pay for it. Do not order a Watch until you  
have first sent for the Prices List, and when you write  
please mention the SCIENTIFIC PRESS.  
Address in full,

**HOWARD & CO.,**  
Watchmakers and Jewelers,  
NO. 885 BROADWAY, NEW YORK.

We have a full stock of extra heavy Cases, such as 4,  
5, 6 and 8 oz., always on hand, and can fill all orders  
promptly. 26v1-hp-aw

SURGEON,  
No. 108 Stockton street, S. F., Cal.

## Irrigation in Yolo.

We were at Woodland last week, and witnessed with our own eyes the wonderful effects of water upon the grain crops in that vicinity. We had been told of the sharp lines of demarkation between adjoining fields, otherwise in all respects alike—one having received the benefits of a "flooding," while the other had been left to drink only what nature had supplied them with; but seeing is believing. Many fields of wheat that did not receive the water until so late that all seemed nearly dead—all the lower leaves being sunburned and crisped—have come forward since the irrigation, and will yield from twenty to thirty bushels to the acre.

So fields of alfalfa that were pastured with sheep until the 20th of April, so close that scarcely a green leaf could be seen—the sheep being then taken off and the water turned on—are now covered with a most luxurious growth of clover, standing as thick as it can be, and from three to four feet high. The clover is just coming into blossom, and will yield from four to five tons and a half of good hay to the acre with a growth of only three months. The same ground will furnish another good crop for seed, or will give good pasture all the balance of the season.

So much are the farmers of Yolo county impressed with the benefits of irrigation that they are preparing to increase and lengthen their ditches, by tapping Cache creek higher up in the cañon, so as to run the water over almost the entire surface of the land in Yolo county.

In conversation with those who have had the longest experience in irrigation, we find they all agree that for grain crops the land should be flooded in the winter season. That with a thorough soaking then, the very best of crops can be secured with almost a positive certainty; and this without any injurious effect on the sanitary condition of the country. They will irrigate their garden vegetables and summer crops later in the season, and thus secure the year round all the substantial and luxuries of rural life.

Had the farmers of Yolo county used all the facilities for irrigation which they might have done the past winter, the crops of this season would have netted them a thousand dollars for each dollar they will now bring them.

In striking contrast to the dried up grain fields we noticed that the vineyards through this section of the country are making a most luxuriant growth, and promise an extraordinary yield of luscious fruit. No irrigation is necessary for vineyards of bearing age, even in the driest of seasons.

We noticed that some of the vineyardists had used the pruning knife most too freely, of late, lopping off too much of the young canes. Experience will teach them that it is better to use the thumb and finger in pinching off the tender ends of these canes, earlier in the season, than to use the knife so freely now. The latter process takes off too many of the full grown leaves, and thus destroys the lungs of the plant, and exposes the tender fruit to the direct rays of the mid summer sun; while the former would have increased the growth of those same leaves, and thus added to the power of the vine to mature its fruit in greater perfection—the leaves at the same time affording the fruit the necessary protection from the burning sun.

**SPECIAL PREMIUMS.**—We notice that offers of special premiums for specific objects not considered by the State Agricultural Society, are still being announced in the Oregon papers. These offers come from public spirited citizens, who thus testify to their earnestness in the agricultural progress of their State. We are curious to see a full list of these premiums, and if it was before us might be provoked to publish it as an incentive to a similar public spirited action on the part of the people of California.

## New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

**OREANA MILLING, SMELTING AND REFINING Co.** Oreana, Humboldt Co., Nev.—June 24. Capital stock, \$1,000,000 in 20,000 shares. Trustees: B. F. Tuttle, A. B. Paul, F. B. Wongard, W. H. Tuttle and H. A. Harmon.

**SUNBEAM G. AND S. M. Co.** Bingham Canyon Utah.—June 24. Capital stock \$220,000 in 2,100 shares. Trustees: O. M. Hall, G. T. Babcock, W. E. Miller, J. Regensherger and H. Palmer.

**LA GRANGE DITCH AND HYDRAULIC M. Co.**—June 29. Capital stock, \$5,000,000 in 50,000 shares. Trustees: D. Taft, W. F. Babcock, B. M. Hartshorne, E. Green and R. E. Brewster.

**ALTA WATER Co.**—July 6. Object, to take the waters of the North and South forks of the American river, the North fork of the Middle fork of the American river, the tributaries of the Truckee river and conduct them to San Francisco. Capital stock \$1,000,000 in 1,000 shares. Trustees: A. W. Von Schmidt, J. Trench, R. Samson, G. H. Eusign and C. W. H. Concy.

**SOUTH CHARIOT M. Co.** Cwyhee Co., Idaho. July 10. Capital stock, \$2,000,000 in 20,000 shares. Trustees: Hill Beachey, G. W. Grayson, C. E. McLane, G. Hearst and M. Livingston.

## Meetings and Elections, Etc.

**MAMMOTH S. M. Co.**—June 5. Trustees: S. Linkton, W. F. Sime, J. Sime, G. Congdon, O. V. Sawyer, F. G. Berry and I. Livingston.

**CROWN POINT M. Co.**—June 6. Trustees: J. D. Fry (President), A. Hayward, R. Sherwood, J. A. Pritchard and B. Peart. Secretary, C. E. Elliot; Superintendent, J. P. Jones.

**IMPERIAL S. M. Co.**—June 27. Trustees: A. K. P. Harmon, T. Bell, J. D. Fry, H. C. Kibbe, W. Norris, J. H. Robinson, A. Bull.

**MAHOGANY G. AND S. M. Co.**—June 28. Trustees: O. H. Bogart (President), M. J. McDonald, T. G. Owens, M. Herman and A. P. Minear. Secretary, C. M. Richardson.

**POCAHONTAS G. M. Co.**—Trustees: L. A. Booth (President), J. Barton, J. Sedgely, J. O. Earle and O. G. Stiles. Secretary, D. A. Jennings.

**OPHIR C., S. AND G. Co.** Trustees: O. H. Bogart, H. C. Swain, C. E. Gibbs, C. F. Brown and W. J. Kip Jr. Secretary R. G. Brush.

**CHOLLAR-POTOSI M. Co.**—July 10. Trustees: A. K. P. Harmon (President), J. D. Fry, W. Norris, A. Bull, J. H. Robinson, H. C. Kibbe and J. Freeborn. Secretary, W. E. Dean; Superintendent, I. L. Requa.

**THE SAN JOAQUIN CANAL.**—Antioch Ledger, July 15. The Friedlander and Bessley Cos. have consolidated. Work is prosecuted on the so-called King's River and San Joaquin Canal. Work has been commenced at the mouth of Fresno Slough, at the confluence of the San Joaquin, 100 miles above Ellis. From here they strike to the foot-hills which will be followed to Antioch. The canal will have an average width of 45 feet. Some 300 teams are already employed.

## Our Printed Mail List.

Subscribers will notice that their names are printed on colored paper and pasted upon each copy of the Press. This is done by machinery, to expedite the issue of our paper, the regular edition of which has become too large to be convenient to send out by the old method of writing the names. The figures found on the right of the pasted slips represent the date to which the subscriber has paid. For instance, 21sep70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4jy72, that he has paid to the 4th of January, 1872; 4j10, to the 4th of July, 1870. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or addresses of subscribers occur at any time an early notice will secure their immediate correction.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

## Traveling Agents.

W. H. MURRAY—Colorado Territory.  
M. W. LEVY—Denver, Colorado.  
M. B. STARR—Pacific Coast.  
THOS. FOYER—California.  
WM. J. CLARK—California.  
L. P. MCCARTY—California.  
E. P. RICKS—California and Oregon.  
A. C. KNOX, City Soliciting and Collecting Agent.

**Complete Volumes of the Scientific Press** from January, 1864, can be had at this office at \$3 per volume. Bound in cloth, \$5. A limited number only on hand.

READERS will favor ourselves and advertisers by mentioning the fact when they obtain information from our columns.

**FOUR MONTHS' SUBSCRIPTION FOR \$1.**—Subscribers to the Press who remit direct to this office \$5 coin, in advance, hereafter, will be credited four months over a year for the extra dollar received above our regular rates. This will render it both convenient and profitable to enclose a \$5 piece in a registered letter, in which case we will be responsible for its safety.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at this office.

## A Good Binder for \$1.50.

Subscribers for this paper can obtain Koch's Patent Elastic Newspaper File Holder and Binder for \$1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and returned in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Postage 35 cts. extra. It can be used for Harper's Weekly and other papers of similar size.

**THE Scientific Press**, of San Francisco, Cal., is now illustrating the beautiful scenery on the line of the Central and Union Pacific Railroads. This journal is of the same size and form as the *Scientific American*, and is one of the most valuable publications on the Pacific Coast. Published weekly by Dewey & Co., 414 Clay street. Terms, \$4 per annum.—*Iron World and Manufacturer, Pittsburg, Pa.*

**MARAVILLA COCOA.**—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopathic and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium.

**TO THE MINING INTEREST.**—Believing that they can thereby aid the mining interest, the managers of the Eighth Industrial Exhibition of the Mechanic's Institute request contributions of ores, minerals and metals from the mines, mills and furnaces of the coast. Such contributions will be given a prominent place, and will be labelled, with details furnished of the condition, etc., of the works from which they come. The collection, if a full one, will attract attention and capital to our mines. Wells, Fargo & Co., will forward, free of charge, all such packages, to be sent before August 5th, addressed to Mechanic's Institute, care J. H. GILMORE, San Francisco.

WOODLAND, July 14, 1871.

DEWEY & Co., Gents: I received the patent paper on my improved wagon all right, and I return thanks for the promptness with which you pushed it through.

Respectfully, C. ELLIOTT.

**PATENT BROKERS.**—Inventors having valuable patents and needing reliable assistance in selling them should consult WEISTER & Co., No. 17, New Montgomery street, under the Grand Hotel, San Francisco.

**\$5 TO \$20 PER DAY AND NO RISK.**—Do you want a situation as salesmen at or near home to introduce our new 7-Strand White Wire Clothes Lines, to last for ever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 16 Dearborn street, Chicago, Ill.

**LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine** against easy monthly installments may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave., New York Good work at high prices if desired.

"I CAN'T SEE IT" say many. But if you really wish to see with a good strong sight you should go to the store of C. MULLER, No. 205 Montgomery street, and look through his glasses.

**CONTINENTAL Life Insurance Co.**, 302 Montgomery street, corner of Pine.

## A CHEAP AND DESIRABLE BOOK.

It contains a complete colored MAP OF THE WORLD, worth double its cost,

AND OVER 40 INTERESTING ENGRAVINGS. 225 pages. In pamphlet, 75 cts.; cloth bound, \$1.00.

FOR SALE BY

DEWEY & Co., of this office.

Postage free.

## HUGHES' PATENT REMOVABLE GLOBE LANTERN.

Since the time when King Alfred made the first lantern by surrounding a candle with a transparent casing of horn, this class of appliances has been one of the greatest utility and most extended use. Among the latest improvements in its construction is that illustrated in the accompanying engravings, and designed to secure the threefold object of providing for the easy cleansing of the glass portion, the secure retention of the lamp in place upon the lower part of the lantern, and the affixing of the hall to the top of the lantern in a durable and efficient manner. The base of the lantern is provided with the usual detachable lamp, and at one side has hinged to its upper edge a wire frame designed to carry and protect the glass portion or body of the lantern, and at the other end of which is the cylindrical top, perforated in the ordinary manner to permit the escape of the products of combustion from the lamp. Arranged at that side of the base opposite the hinge is an angular spring-catch so applied as to catch over the annular lower rim of the wire frame, and in conjunction with the hinge, to hold the said frame firmly in place upon the base as required when the lantern is in use.

This Lantern is offered as

The Best and Most Desirable in Use,

all things considered. Its price is reasonable, and when once tried no other will be accepted.

Individuals, Dealers, Railroad Companies, and all persons and institutions about to purchase Lanterns, should inquire for this kind; and if not for sale in your locality, address the inventor for circular of full description, price list, etc.

Patented August 10 and December 28, 1869, by

Address 1811 Sidney street, East Birmingham, Pa.

JOHN HUGHES.

3723-24 amfm

## Mining and Other Companies.

During the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can revise advertisements.

## Eagle Quicksilver Mining Company—Location of works, Santa Barbara County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of June, 1871, an assessment of twenty dollars per share was levied upon the mines of said Company, payable immediately in gold coin of the United States, to the Secretary, at his office, Room No. 3, No. 302 Montgomery street, San Francisco, California.

Any share upon which said assessment shall remain unpaid on Wednesday, the 9th day of August, 1871, shall be deemed delinquent, and will be duly advertised August 12th, 1871, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 14th day of August, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.  
Office, Room 3, No. 302 Montgomery street, San Francisco, California.

## Highland Silver Mining Company—Location of works, Railroad District, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 13th day of July, 1871, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately, in United States coin, to the Secretary, at No. 28 Merchants' Exchange, San Francisco. Any stock upon which said assessment shall remain unpaid on Monday, the 21st day of August, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 13th day of September, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILCOX, Secretary.  
Office, No. 28 Merchants' Exchange, California street, San Francisco, Cal. July 15-1d

## Marcelina Silver Mining Company.—Location of works, Eureka District, Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 24th day of June, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the 8th day of June, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the sales-room of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on the 8th day of August, 1871, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.  
Office, 206 Front street, San Francisco, Cal. July 22-2w

## Office Alleghany Consolidated Gold Mining Company, Sierra County, California.

Notice.—The annual meeting of stockholders of the above named company, for the purpose of electing Trustees and transacting any necessary business, will be held at the office of the company, No. 31 New Merchants' Exchange (third floor), California street, San Francisco, on Monday, the 31st day of July, 1871, at 3 o'clock P. M.

J. M. BUFFINGTON, Secretary.  
July 22-2w

## Taylor Mill and Mining Company—Location of works, Georgetown District, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of July, 1871, an assessment of ten (10) cents per share was levied upon each and every share of the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 529 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 15th day of August, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 4th day of September, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

SAM'L S. MURFEY, Secretary.  
Office, 529 Montgomery street, over Sather & Co's Bank, San Francisco, Cal. July 15-1d

# BERRY & PLACE,

## MACHINERY AND SUPPLIES.

Importers and Dealers in  
SAN FRANCISCO, CAL.  
Sole Agents in Pacific States for Sale of

Blake's Patent Steam Pumps,  
Smith's Wood-Working Machinery,  
Davis & Furler's Woolen Machinery,  
The Swain Turbine Water Wheel,  
Wood, Light & Co's Machinists' Tools,  
Sturtevant's Pressure Blowers,  
Hardy's Portable Drillers,  
Dreyfus' Patent Self-Oilers,  
Gardner's Safety Stop Governor,  
Page's Belting, Etc., Etc.

We keep in stock the above, with a large variety of other Machinery and Small Tools.

## Dreyfus' Patent Self-Oilers and Cylinder Cups.

A saving in oil of 75 to 95 per cent, guaranteed. No trouble of "oiling up" No waste of oil! No oil cans needed!

### NATHAN & DREYFUS

#### SELF OILERS.

These Oil Cups are too well known to require any lengthy description; the following are the main points of advantage.

We guarantee a saving of  
75 PER CENT OF OIL.

They are composed of a transparent Glass Cap, mounted in Brass, provided with a hollow tube, inside of which is placed a loose acting solid or hollow wire, which acts as a Feeder and Regulator. The wire rests constantly upon the Journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion.

They are as reliable in Winter as in Summer.

Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' constant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give perfect and entire satisfaction.

No testimonials are printed, but ask any one who has them what they think of them. Be sure you get Dreyfus'. Send for Circular and Price List to BERRY & PLACE, San Francisco.

## GARDNER &amp; ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.

The Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, positive insurance against all accidents liable to occur from slipping or parting of the Governor or driving belts, and a convenient arrangement for adjusting the speed of the Engine while in motion, without change of pulleys.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. Thus we warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheerfully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE; and either BLACK OR FINISH, as you may require. Send for Price List to BERRY & PLACE, San Francisco.

## Nathan &amp; Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup to the public, we desire to call very particular attention to its many special advantages: First—Nothing but clean oil or tallow is admitted into the Cylinder; no lime or sediment of any kind. Second—Its great economy of both tallow and fuel. Third—It is self-acting, and supplies the lubricating material only while the Engine is in motion. Fourth—Its certainty and regularity of feeding, and increase of the power of the Engine.

The principle upon which this apparatus is founded is that, instead of admitting tallow into the Cylinder in considerable quantities at uncertain intervals by means of tallow cups, grease cups, and other crude contrivances, and allowing it to be instantly blown out at the exhaust (as must necessarily be the case), this Cup, by its peculiar action, delivers the lubricant in drops into the body of the steam, which thereby becomes thoroughly impregnated or greased before passing into the steam chest or Cylinder; the consequence is, that instead of falling to the bottom of the Cylinder, as it does when admitted through a tallow cup (which passes the lubricant from the bottom of the Cup to the Cylinder), it enters into the form of minute globules, and hence the whole of the internal parts of the engine become regularly and constantly greased. The result of its action has been proved in a very great number of cases to be an enormous saving of tallow, a considerable increase in the power of the engine, a great saving in fuel, and reduction of internal friction to a minimum.

These Lubricators will save you 75 per cent. of the Lubricating Material, and cost no more than the common Compression Cups.

PINTO MINING COMPANY.—The above sale is postponed until Wednesday, the 16th day of August, 1871, at the same time and place. By order of the Board of Trustees.  
D. B. ARROWSMITH, Secretary.

Sects and Creeds differ, but there are no dissenters from the general principle, that a great medicine is a great blessing. We have many of these blessings, but among them all, in the province to which it belongs, no greater than

Tarrant's Effervescent Seltzer Aperient. A column would not suffice to enumerate the ailments for which it is prescribed by physicians of the highest standing. It does not belong to the class exclusively termed patent medicines, but is an article based on scientific analysis, and will stand the test of the sharpest and most rigid medical criticism as a cathartic, a stomachic, an anti-febrile preparation, and an admirable remedy for all bilious complaints. LET THERE BE NO MISTAKE. SECURE THE GENUINE ARTICLE ONLY. SOLD BY ALL DRUGGISTS.

First Premiums awarded by American Institute, N. Y. MICROSCOPES.

Illustrated Price List sent free. Magic Lanterns and Stereoscopes. Catalogue, priced and illustrated, sent free. McALLISTER, Optician, 49 Nassau street, New York. 3v23-1y

## BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETTS'S NAME IS ON EVERY CAPSULE he makes for the principal merchants in England and France, thus enabling the purchaser to the class exclusively termed patent medicines, but is an article based on scientific analysis, and will stand the test of the sharpest and most rigid medical criticism as a cathartic, a stomachic, an anti-febrile preparation, and an admirable remedy for all bilious complaints. LET THERE BE NO MISTAKE. SECURE THE GENUINE ARTICLE ONLY. SOLD BY ALL DRUGGISTS.

## Machinery.

### STEAM JET PUMP.

Blakeslee & Williams' Patent. For Water, Oils, Acids, Etc.

The best COLD WATER PUMP for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit:—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

**Warranties guaranteed or the money refunded.** Send for Circular. PARKER & HUNT, Southeast cor. Tenth & K Streets, Sacramento City Cal. AGENTS—CHAS. F. BROCK, 117 California st., San Francisco; KEEL & BARGON, Stockton. Can be seen at McAFEE, SPIERS & Co's. Boiler Works, S. F. 21v21-tt

## WHY THE WILSON

### Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbag," but call and investigate the merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation. For further particulars address

FURMAN R. WILSON,  
San Francisco.

### THE PATENT Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fenning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired. For further information apply to R. STONE, 25v22-3m 422 Battery street, San Francisco.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION.—D is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. F is the discharge pipe for the lubricant, provided with an inverted siphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. H, a valve and pipe to introduce water under the lubricator for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the selection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. 1818-tf

San Francisco,  
who have the different sizes always in store. 4v22

## Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows: The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surface and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely sheared.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

## Miscellaneous.

### 7-30 GOLD LOAN

OF THE

## Northern Pacific Railroad.

RAPID PROGRESS OF THE WORK.

The building of the Northern Pacific Railroad (begun July last) is being pushed forward with great energy from both extremities of the line. Several thousand men are employed in Minnesota and on the Pacific coast. The grade is nearly completed 266 miles westward from Lake Superior; trains are running over 120 miles of finished road, and track-laying is progressing at the rate of one to two miles per day. Including its purchase of the St. Paul & Pacific Road, the Northern Pacific Company now has 413 miles of completed road, and by September next this will be increased to at least 660. A GOOD INVESTMENT. We are now selling, and unsubstantiated by recommendation, are from the perfectly safe investment, the First Mortgage Land Grant Gold Bonds of the Northern Pacific Railroad Company. They have 30 years to run, bear Seven and Three-tenths per cent. gold interest (more than 8 per cent. currency), and are secured by first and only mortgage on the ENTIRE ROAD AND ITS EQUIPMENTS, and also on 21,000 ACRES OF LAND, covering more of track, or 500 Acres for each \$1,000 Bond. They are exempt from U. S. Tax; Principal and Interest are payable in Gold; Denomination: Coupons, \$100 to \$1,000; Registered, \$100 to \$10,000.

LANDS FOR BONDS. Northern Pacific 7-30's are at all times receivable at TEN PER CENT. ABOVE PAR, in exchange for the Company's Lands, at their lowest cash price. That is, in addition to their character as first-class, prompt-paying Railroad securities, these Bonds are in effect Land Warrants bearing a profitable rate of interest until exchanged for Homesteads, at TEN PER CENT. PREMIUM.

SINKING FUND. The Land Grant of the Road exceeds Fifty Million Acres, having an average soil of great fertility, in a climate that is simply unsurpassed. The Trustees of the Mortgage, Messrs. Jay Cooke and J. Edgar Thomson, are required to devote the proceeds of all Land Sales to the repurchase and cancellation of the Company's Bonds. This immense Sinking Fund will undoubtedly cancel the principal of the entire issue of First Mortgage Bonds (now selling) before they fall due. With their ample security and high rate of interest there is no investment accessible to the people, which is more profitable or safe.

EXCHANGING U. S. FIVE-TWENTIES. In view of the Government's expectation soon to call for the surrender of its outstanding 5 per cent. Bonds, under the present movement for funding the debt at lower interest, many holders of United States Five-Twenties are exchanging them for Northern Pacific Seven-Thirties, thus realizing a handsome profit, and greatly increasing their yearly income.

OTHER SECURITIES.—AGENCIES. All marketable Stocks and Bonds will be received at their highest current price in exchange for Northern Pacific Seven-Thirties. EXCESS CHARGES ON MONEY OR BONDS RECEIVED, and on Seven-Thirties sent in return, will be paid by the Financial Agents. AGENCIES for the sale of this loan are established in nearly every city and important town throughout the United States and Canada. Full information, maps, pamphlets, etc., can be obtained on application at any agency, or from the undersigned.

## The California Powder Works

No. 314 CALIFORNIA STREET.

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

## HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office. 16v20-3m JOHN F. LOHSE, Secretary.

The "PAIN KILLER" may justly be styled the great medicine of the world, for there is no region of the globe into which it has not found its way, and been largely used and highly prized. Moreover, there is no claim to which it has not proved to be well adapted for the cure of a considerable variety of diseases; it is a speedy and safe remedy for burns, scalds, cuts, bruises, wounds and various other injuries, as well as for dysentery, diarrhea, and bowel complaints generally, it is admirably suited for every race of men on the face of the globe. It is a very significant fact, that notwithstanding the long period of years that the "Pain Killer" has been before the world, it has never lost one whit of its popularity, but on the contrary, the call for it has steadily increased from its first discovery and at no previous time has the demand for it been so great, or the quantity made been so large, as it is to-day. Another significant fact is, that nowhere has the Pain Killer ever been in higher repute, or been more generally used by families and individuals, than it has been here at home, where it was first discovered and introduced. That the Pain Killer will continue to be, what we have styled it, THE GREAT MEDICINE OF THE WORLD, there cannot be the shadow of a doubt.—Providence Advertiser.

## BOONE'S C-SPRING ROLLER SKATE.

PATENT GRANTED.

This SKATE surpasses in Elasticity, Durability and Ease of Operation, any other Skate in existence. Its  
superiority has been proved wherever it has come in competition with any other Roller Skate.

FOR DESCRIPTION SEND FOR DESCRIPTIVE CIRCULAR.

Warranted to run longer without requiring to be repaired than any other Skate.

Owners of Rinks will find it the most profitable as well as the most satisfactory to their patrons. The  
patentees guarantee the right to run this Skate to purchasers of rights for the full term of the patent, and

Warrant it to be no Infringement on any Existing Patent.

State, County, Town and Rink Rights for sale at reasonable terms.

Apply by letter or in person to

**WILLIAM SMALL,**

105 Montgomery Street, S. F., Cal.,

General Agent for the United States.

## THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

**GIANT POWDER, A NO. 2 GIANT POWDER,**

Somewhat slower in its Explosion, which we recommend for

**BLANK BLASTING, COAL MINES,**

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD  
It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

## Improvements in Sewing Machines.

We lately had an opportunity of examining some important improvements in the sewing machine. The device, which we saw adapted to Howe's large cylinder machine for sewing leather, is the invention of Mr. H. W. Hanna, of Petaluma, and its description will be found of interest to many of our readers.

The invention consists principally of the following points. The shuttle is curved upwards on its lower side to a certain distance from its point, and the driving mechanism is so arranged that the shuttle is drawn back the length of this curve while the needle is rising out of the work. The result is that there is no extra tension on the thread during this time, but sufficient slack is given to correspond to the thickness of the work. In the common form of the machine, this slack must be gained by a corresponding stretching of the thread, and if the thread is not elastic enough for this, it must break. In the improved form there is no such extra strain on the thread and consequently no liability to break at this period.

Another point must be noted. In the common form, there is a space left between the shuttle and one side of the shuttle guide for the insertion of the shuttle thread, but the shape of this space is such that occasionally the thread can kink and get between the shuttle and guide, in which case it is broken by the forward motion of the shuttle. In the improved form, a little flange is added to the side of the guide in such a way that, as the shuttle moves and slack is given to the thread, this last cannot curl up into this space; and consequently this trouble is obviated.

These are the principal points of the invention, and it will be seen that they are of very considerable importance in using the sewing machine, obviating many vexatious troubles to the operator. Several indirect advantages arise from the improvements, and as these can be adapted to other machines of the kind, they are certainly worthy of careful investigation. Steps have been taken to secure the rights of the inventor through the SCIENTIFIC PRESS Patent Agency.

**CARBOLIZED COMBINATION HOSE.**—This hose will soon be tested by the City Fire Department. It is said to be almost exclusively used by the fire departments of New York and Brooklyn, to have given such satisfaction at Marysville that it is to be adapted more extensively there, and to have been most successfully used by the C. P. R. R., the C. Steam Navigation Co., the Cal. Powder works and the Blue Gravel M. Co.

**THE RIVERSIDE COLONY** has a tract of 30,000 acres in the Santa Anna valley, San Bernardino county, where some 50 families are now settled. A ditch, 10 miles long, has been completed and another is being constructed. The scheme originated in Boston.

## The Bavarian Breech-loading Rifle.

The London *Mechanics' Magazine* has given an illustration and description of this arm, called the Werder rifle, which did good execution in the late French campaign. As a matter of interest to many of our readers, we re-publish this, with the cuts for which we are indebted to the *Amer. Artisan*.

The breech-block of this rifle is something like that of the English Snider, only much shorter; it is hinged on lugs at one side, so that it can be lifted and thrown

stem projects is provided with a lip, and the nose of the hammer in coming down upon the striker engages itself thereon, and holds the block secure while the explosion takes place.

The construction of the rifle will be well understood by referring to the engravings, where Fig. 1 shows the breech portions, with the block thrown over to expose the bore ready to receive a cartridge, while Fig. 2 shows the block closed and the hammer on the nipple. The other portions of the arm are of the ordinary construction. It will be seen that the back force of the ex-

Fig. 1.

Fig. 2.

THE BAVARIAN BREECH-LOADING RIFLE.

over to open the breech by means of a lump projecting from the other. The hammer rises through an opening in the top of the tang, similar to the English Snider, and acts upon the stem of the striker at the center of the block to ignite the charge. There is a projection on the extractor, which is struck sharply by the lip of the block when the block is thrown over, so that the empty case is withdrawn from the chamber.

In order to prevent the escape of gas at the breech at the time of the explosion, the bottom face of the block is grooved, which grooves take over the ribs on the top face of the box, and thus divert the gases from the face of the soldier, should there be an escape from a faulty cartridge.

The nipple through which the striker

plosion is received by the two cheeks against which the block rests when closed down.

**WATER ENTERPRISE.**—The Virginia City *Enterprise*, of July 18th, says that the Virginia & Gold Hill Water Co. are making the final survey for bringing water to Virginia City from streams emptying into Lake Tahoe. The total distance is 51 miles, 35 miles of flume, 8 miles of iron pipe, and then 8 miles of flume again. Eight miles of the pipe, from the foothills of the Sierra to the range on which Virginia City stands, will be of cast iron, of an internal diameter of 12 inches. The greatest pressure is given as 1,660 feet, which is enormous.

The borax consumption of the world is about 11,000 tons annually.

## Swamp and Overflowed Lands.

Application was made last June to the U. S. Land Commissioner to have action taken for examining the segregation maps and surveys of swamp and overflowed lands made by the State of California, in order to have township-plats constructed and approved by the General Land Office in accordance with the Act of July 23, 1866, to "quiet land titles in California." Directions were issued, in accordance with the Act, in September, 1866, but since then the State has heard nothing of the matter. The General Land Commissioner in reply to the application, has sent, under date of July 7th, to the State Surveyor General and to the U. S. Surveyor General at this city, segregation maps of such lands in the counties of Colusa, Alameda, Monterey, Santa Clara, Yolo, San Joaquin, Lake, Humboldt, Sonoma, Napa, Sacramento, Sutter, Placer and Solano. These were found amongst the files of his office without any data as to the time or purpose of transmission.

If these conform to the system of surveys adopted by the U. S., township-plats are to be constructed, approved and forwarded to the General Land Office for approval. If discrepancies occur, they are to be noted on the official plats forwarded. If U. S. surveys have not been made in any places, such are ordered made within one year.

## The Santa Cruz Railroad.

The final report of the Chief Engineer (Mr. W. J. Lewis) of the Santa Cruz & San José R. R. has been published. A line was run from San José (at the intersection of San Carlos street and the Southern Pacific in Front street), to near Los Gatos to the Los Gatos Creek, thence to Ten Mile House, along the tollroad through the cañon, and through Lexington to near the Forest House. It then runs near the channel of Los Gatos creek and transversely up the ridge to a tunnel at Taylor's Pass, then down to Soquel and to the landing at Santa Cruz. The projected tunnel and cut are 2,000 feet in length, through soft sand rock. The total length of the line is 38.12 miles; the maximum grade, 132 feet; the minimum radius, 230 feet, except at one point where a curve of 130 feet would save considerable expense.

The cost of the road bed and superstructure is estimated at \$450,000, or about \$11,805 per mile. This may be reduced considerably. By adopting a higher grade, the tunnel at Taylor's Pass may be avoided. The object of the survey was to ascertain the practicability of the route for a narrow gauge road. This is demonstrated, and also the fact that the cost of road bed and superstructure of the narrow gauge will be less than that of the superstructure alone of the 4 ft. 8½ in. gauge.

THE UTAH SOUTHERN R. R. is located and let for the first 20 miles. Track is laid as far as Little Cottonwood.

## MECHANICAL PROGRESS.

**STEAM TYPE-COMPOSING MACHINE.**—The *Mechanics' Magazine*, July 1st, says that A. Mackie, of the *Warrington Guardian*, has invented a machine which really does efficiently the work of the compositor. It consists of a perforating and a type-setting machine. The former is a small apparatus with 16 finger keys, which prepares strips of paper which govern the type-setter. The strips are about 2 in. wide, perforated with a central, continuous row of equidistant holes, on each side of which are eight other rows, not continuous but intermittent. These strips are to the type-setter what the Jacquard cards are to the loom. The rate of production with one perforating machine is about 10,000 letters per hour. The composing machine is a circular metal framing, having around its periphery 29 boxes or "pockets," each divided into 8 compartments, 7 for letters and 1 for spaces. A lip at the bottom prevents the type from falling out, but room is left for the insertion of the "pickpocket." Inside the circle of pockets another wheel revolves, carrying a number of type-extractors, or "pickpockets," arranged around its periphery. Each pickpocket has a receiving table, in which are formed 8 holes through which pins are caused to rise. These tables are hinged and can be lowered so that any type on them will clear the pockets, or they can be raised horizontally to pass close under the pockets. If when thus raised any of the pins project above the face of the table, each pin, passing under a pocket, will draw out a type from that division under which it passes. Such types fall on the receiving table, which is then depressed and carries the types to the point of delivery. The perforated paper strip is fed into the machine and fed forward by pins fitting the central row of holes. Sixteen levers with pegs are always seeking to enter the other perforations. Two of the first eight levers find the perforations which set the pickpockets, so that they will act on the proper pocket. The second eight levers find holes according to the word wanted, so that a pickpocket can take type out of all the 8 divisions of any pocket simultaneously, when necessary. A certain method of arrangement is observed in placing the types in the pockets, and thus Mr. Mackie has been able to produce combinations by which he can withdraw from the pockets, each at a single operation, about 700 words or parts of words. We have thus a machine possessing the almost wonderful power of composing complete words at one operation. The types are discharged from the receiving tables, by proper devices, in a continuous stream into lengths of brass rule. Then manual labor removes them at times, divides them into lines, and justifies. The distribution of the letters into duplicates of the pockets is done by boys. The composing power of the machine is stated to be 12,000 letters per hour, equal to a column of the *Times* in minion, or small type. The machine has been operating for nearly a year for the *Guardian*, and is now used for the *Graphic*, and is highly praised.

**BALLOON COMPASS.**—The French astronomer, Janssen, has invented a compass for determining the course and speed of balloons. It is described in the *Comptes Rendus* of last February. It consists of a cylindrical metal case,  $3\frac{1}{2}$  to 4 inches in diameter, and the same in height, with a glass bottom and open at the top. Two small arms on branches rise from the upper end of the case and support between them a little metallic disk 10 to 12 in. above the glass bottom. This disk serves as an eye piece, having a small hole in it in the line of axis of the cylinder. Upon the glass bottom are engraved a number of concentric graduated circles, whose radii are so calculated as to be visible through the eye piece under angles of  $1^\circ$ ,  $2^\circ$ ,  $3^\circ$ , and  $10^\circ$ . Four diametrical lines divide the largest circle (the "great circle") at equal distances. The instrument is hung by a Cardan apparatus so as to insure verticality during observation. A compass needle is fitted to the glass bottom, a little eccentrically (to leave the vision unimpeded) and is provided with a small graduated circle, of which the needle's pivot is the center, so divided that the cord of  $180^\circ$  may be parallel to the line  $0^\circ$ — $180^\circ$  of the great circle. By looking at points on the earth through the eye piece, and by the aid of calculations, the course and speed of the balloon can be ascertained.

**AUTOMATIC OR FAST-SPEED TELEGRAPH.**—Prof. Wheatstone's apparatus consists of a perforator, a transmitter and a receptor. The perforator is an iron case with three keys struck down by the operator. These keys work with three punches which produce holes corresponding to dots, dashes and spaces in the strip. The transmitter consists of a clockwork which draws the prepared paper continuously forward by the teeth on the periphery of a spurwheel entering the central line of holes of the paper. The holes on the one side or the other represent the positions of positive or negative currents. Two small vertical pins move up and down underneath the paper strip, one under each row of holes. When a hole occurs, the pin rises through it and, by a connecting lever, suitable contact is made with the battery. When no hole occurs, the pin stops against the paper and no contact is given. The receptor is similar to the ink-recording Morse apparatus, but of somewhat finer arrangement and very light, thus allowing great sensibility and fast working.

The Siemen's system differs principally in providing the paper strip with a continuous line of holes previous to punching it with holes for giving currents, and in the current-holes being provided in the requisite groups by punches worked by a keyboard, so that the operator has only to press one key for each letter, instead of composing the letters of the elementary signals. The keyboard has as many keys as there are letters, figures and punctuation marks. The momentary touch of a key punches properly and advances the strip for the next punch. The transmitter is arranged either for magneto-electric or for galvanic currents. For the latter the contacts with the alternate holes are given by a special commutator of the form of a roller cut in balvics, which come together in saw-teeth and fit into one another without touching. The halves connect with the two poles of a battery, and as the holes in the paper strips occur at intervals corresponding to the breadth of the teeth, the contact spring or brush falling through a hole makes contacts with the alternate holes as the grouping of the signal requires. The receiving apparatus is a very delicate inkwriter, the cores of its electromagnets being made of rolls of sheet iron. *Mechanics' Magazine*.

**FERRIE'S SELF-COKING BLAST FURNACE.**—The one at the Monkland Iron Works is illustrated in *Engineering* of June 16. It is 83 ft. high, 18 ft. in diameter at the boshes and  $12\frac{1}{2}$  ft. at the top. The upper part for 20 ft. below the bell and cone space is divided into 4 compartments by vertical walls, resting on arches and radiating from the center. These walls and the circumferential walls are pierced with flues, into which is received a portion of the gases taken from the top. These gases are here ignited, receiving a supply of air through gratings in the external wall of the furnace. The temperature in the flues ranges from  $1500^\circ$  to  $1700^\circ$ . This effects a coking of the coal in the compartments, a driving off of all moisture in the ore, etc., and the expulsion of the carbonic acid out of the limestone. The materials fall from these compartments into the smelting zone. Very good results are reported. Mr. Ferrie claims a saving of nearly 1 ton coal to 1 ton of iron produced, and a saving of  $2\frac{1}{2}$  cwt. ore per ton of iron, at least in certain districts. The furnace runs regularly and produces good iron.

**THE BURDEN HORSE SHOE** patent has been extended. The machine turns out a shoe each second, of an average weight of 1 lb. One machine often uses  $10\frac{1}{2}$  tons of bar iron in 12 hours, equal to the work of at least 600 men. The average cost of making a horse shoe by hand is estimated at 16 to 20 cts. (exclusive of material); the average cost of the Burden shoe is  $8\frac{1}{2}$  to 5 cts. Since the introduction of the machine, 82,000 tons of iron have been used by it, and the sales have amounted to \$9,000,000,—a saving of \$18,000,000 to the public.—*Ex.*

**SLATE FOR ENGRAVING.**—The use of slate, instead of box-wood, for engraving is said to have been found both economical and efficient. The blocks are easily cut, will wear as well as electrotypes, furnish over 100,000 impressions without loss of detail, are not affected by oil or water, do not vary with the temperature, and do not warp.

**THE SUEZ CANAL** is regarded as definitely completed, having a depth of 26 ft. 8 in. throughout. M. de Lesseps is stated to have been negotiating with the Duke of Sutherland for additional capital. The financial results of the enterprise are not favorable.

## SCIENTIFIC PROGRESS.

**METALS PRECIPITATED FROM SOLUTIONS BY SULPHIDES—GOLD AND SILVER DEPOSITS.**—Mr. Daintree had observed that gold, when placed in a solution of its chloride undergoing decomposition by contact with organic matter, acts as a nucleus for the liberated gold. Copper, iron and arsenical pyrites, galena, zincblende, stibnite, wolfram and molybdenite also act thus as nuclei, but brown iron ore and quartz do not. Mr. Wm. Skeay, of the New Zealand Geological Survey, has been seeking an explanation of this. His results were given in a paper which has been published by the *Chemical News*. We condense: That gold should act as a nucleus for gold liberated from solution, is similar to the action of numerous other substances. The protoxide of iron in wolfram explains its action, as soluble proto-salts of iron reduce gold salts. The other cases are those of sulphides and arsenides. Experiments show that these have a reducing power on gold chloride. The presence of organic matter is no help, but rather a hindrance. Gold chloride was found to be reduced by contact with proto- and bi-sulphide of iron, ferro-sulphide and sub-sulphide of copper, sulphides of zinc, tin, molybdenum, lead, mercury, silver, antimony, bismuth, arsenic, platinum and gold; also by mispickel ( $\text{Fe As}_2 + \text{Fe S}_2$ ) and arsenide of silver. Cubical iron pyrites is rather slow in its action; antimony sulphide scarcely affects it at first, but rapidly after some hours. All these effects occur at common temperature, except with sulphide of bismuth. There is no reason to suppose that light has been concerned in these reactions.

The mode in which these effects were produced was by the oxidation of the metal and of the sulphur (arsenic) of the nuclei. Silver and platinum also, and possibly most or all of the metals of the platinum series, are found reducible in this way from their solutions in acids by metallic sulphides and arsenides. Thus, silver is reduced from its nitrate and acetate very readily by galena, copper pyrites and the inferior sulphides of iron and copper. From ammoniacal solutions, however, it is not reduced by any of these sulphides, not even when heated with them, except by sub-sulphide of copper. As deposited by galena, wire-silver was formed just as found in nature. Cubic iron pyrites and stibnite has little or no effect on silver salts, even when heated with them; arsenide of silver has a feeble effect. Platinum is reduced slowly from its bi-chloride solution by galena and grey copper ore, and still more slowly by iron pyrites. These were the only sulphides tried. None of the sulphides enumerated appear to reduce metallic mercury from its bi-chloride solution, but most of them reduce it to sub-chloride. Sulphide of gold even thus effects this mercurial salt, the sulphur being oxidized, and the gold set free. Neither sulphate nor acetate of copper are affected by these sulphides. Perchloride of iron is reduced to protochloride by galena and grey copper ore.

Now, when, in place of the chloride used in the above experiments, the oxide of gold was used in solution of either potash, bicarbonate of soda, or an alkaline silicate, the same reduction of the metal followed—at least, this occurred with galena and the inferior sulphides of iron and copper. With the oxide dissolved in ammonia, to produce this result, the solution must be heated to about  $200^\circ$  F. The sulphide of gold, however, dissolved in any of these salts or alkalies, could not be reduced by contact with any of these sulphides, even by boiling or adding strong deoxidizing agents, as tannic or gallic acids. This tends to show that in the case where Mr. Newberry obtained the reduction of gold upon iron pyrites from a solution of its sulphide in bicarbonate of soda mixed with organic matter, the gold had, prior to its reduction, in some way lost its sulphur and taken up oxygen, thus becoming a salt readily reducible by deoxidizing agents. Anyway, it is inconceivable how organic matter and metallic sulphides, alone or together, can desulphurize a good sulphide. Organic matter by its decay would rather generate than decompose sulphides. Gold has far more affinity for sulphur than for oxygen, and therefore a chemical interchange effected by the mere addition of bicarbonate of soda to gold sulphide is hardly supposable. Besides, if it were, the reduction should have proceeded as

well with this kind of solution as with gold oxide in solution of bicarbonate of soda, which I found it did not. Further experiments in this direction are, however, absolutely necessitated by the importance of ascertaining positively whether there is any solution of gold (likely to occur naturally) able to resist the reducing power of either metallic sulphides or decaying organic matter.

**MICROSCOPIC CHARACTER OF IRON AND STEEL.**—According to Mr. Schott, the different qualities of iron and steel can readily be distinguished by means of the microscope. Thus, the crystals of iron are double pyramids, in which the proportion of axes to the bases varies with the quality of the iron. The smallness of the crystals and the height of the pyramids composing each element, are in proportion to the quality and density of the metal, which are seen also in the fineness of the surface. As the proportion of carbon diminishes in the steel, the pyramids have so much the less height. In pig iron, and the lower qualities of hard steel, the crystals approach more closely the cubic form. Forged iron has its pyramids flattened and reduced to superposed parallel leaves, whose structure constitutes what is called the nerve of the steel. The best quality of steel has all its crystals disposed to parallel lines, each crystal filling the interstices between the angles of those adjoining. These crystals have their axes in the direction of the percussion they undergo in the working. Practically, good steel examined under the microscope has the appearance of large groups of beautiful crystals, similar to points of needles, all parallel and disposed in the same direction.—*Van Nostrand's Magazine*.

**WYOMING FOSSILS.**—Prof. Marsh has described several new fossil land lizards, discovered in the tertiary deposits of Wyoming. Some of these are as large as any now living in tropical America, but all are quite distinct from any hitherto found. They represent a new genus, called *Glyptosaurus*, because the head and parts of the body are covered with highly ornamented bony plates. Four species are described, readily distinguished by the form and ornamentation of the shields on the head: The largest, *G. sylvestris*, was about 4 feet long; the smallest, *G. anceps*, about 2 feet; the others are called *G. nodosus* and *G. ocellatus*. They will be fully described in the *Amer. Jour. of Science*.

**EXTRAORDINARY RAILROAD IRON.**—The *Montreal Gazette* states that the Canada Grand Trunk Railway has received from England samples of steel for rails and axles which will challenge comparison with any material ever made for these purposes. "A rail was twisted cold 13 times before fracturing, in the shape of a spiral spring; and the fracture indicated that the metal still retained its hardness, toughness and malleability. An axle was bent cold in a testing machine, with a pressure of 2 tons at 3 ft. 6 in. bearings, into a complete knot without any fracture whatever." Other remarkable samples are also reported.

**AQUEOUS SOLVENT FOR SULPHUR.**—Various experiments have been made for the purpose of finding an aqueous solvent for sulphur, a great desideratum in facilitating the use of this substance in medicine. Dr. Pole announces that if flowers of sulphur, previously well washed and dried at  $212^\circ$  F., are mixed with an aqueous solution of pure carbonate of soda and the whole digested at  $212^\circ$  for 10 hours, considerable sulphur will be taken up. Linseed-oil is another solvent for sulphur, the amount increasing with the temperature.—*Harper's for August*.

**STRUCTURE OF MOSASAURUS.**—The cretaceous fossils of the Rocky Mts., discovered by Prof. Marsh (*Amer. Journal of Science* for June), prove conclusively that the mosasaurid reptiles had a well developed pelvic arch and posterior limbs, a fact hitherto considered very doubtful. Some of the species were more attenuated than any before described. One, *Clidastes Wymani*, was about 30 feet long, and had the terminal caudal vertebrae less than 1-12th inch in transverse diameter.

**KNOT-TYING MACHINE.**—P. A. Perry, of Perth Amboy, N. J., has patented a device which is said to tie a square knot precisely like that made by hand. The nearest approach previously to tying by machinery has consisted in twisting the ends of the string or wire together and tucking them under the band.

# CORRESPONDENCE.

## A Trip to Colorado.—No. 3.

By OUR OWN TRAVELER.  
Golden City.

Leaving Denver on the Colorado Central R. R., we have a beautiful ride to Golden City, situated on the Vasquez Fork of the South Platte. This place has an exceedingly pretty site, and the natural resources of coal, fire-clay, building stone, iron ore, copper, etc., together with a good water-power, seem to indicate that the city must assume a very important position as a manufacturing center.

Already it has a large number of factories of various kinds, flour mills, paper mill, saw mills, tannery, brick works, etc., etc. It has also churches, a college, free schools, the Territorial School of Mines, etc.

The Golden City Mineral and Land Company has a capital of \$500,000, and owns much valuable property in the shape of coal and iron beds, deposits of "glass silica," etc. It manufactures fire-brick, tiles, drain pipes, etc. It has leased its coal lands to the Hazelton Coal M. Co., of which I shall have more to say. The efficient agent of the M. and L. Co. is Mr. M. C. Kirby.

### Manufactures.

One of the first places I visited was Boll's Fire Brick Works. These have been leased by Weibel & Co., and have a capacity of some 6,000 fire bricks weekly of excellent quality. Their bricks are used at Hill's smelting works at Black Hawk, and elsewhere. They furnish these at Golden City at the rate of \$100 per thousand. They also manufacture crockery.

The Golden City Paper Mill is a credit to the place and is ably managed by the superintendent, Mr. R. C. Wells. This mill supplies the daily and weekly papers of the Territory with a very good article of printing paper, and turns out also manilla and wrapping paper. Its full capacity is one ton in 24 hours, but at present it manufactures only about 10 hundredweight daily. It is run by water-power, employs 9 hands, and has a 36-inch cylinder machine.

The Rock Flouring Mill is owned by Mr. O. F. Barber, has three run of stones, is run by water-power, and has, I believe, an excellent reputation. I noticed two other flour mills here which were not running, however, at the time of my visit.

Large smelting works are to be erected here, I am told, within a short time.

### Schools—Papers—Hotels.

Jarvis Hall is a prominent institution here. It is intended to give a thorough course of studies, fitting boys for business and professional pursuits. The name is given in honor of Mr. Geo. Jarvis, of Brooklyn, N. Y., who donated the money for erecting the building. It is located very pleasantly about a mile out of the city on rising ground, and is a fine edifice. The Rt. Rev. Geo. M. Randall is rector. To Mr. Geo. W. Davies, the Vice-Principal, and to Mr. E. L. Berthoud, instructor in Civil Engineering, Botany and Geology, both gentlemen of fine attainments, I am indebted for several acts of kindness and valuable facts concerning the locality.

I visited the School of Mines, for which the Territory has given \$3,280, and much more has been raised by subscription. The building, at present unfinished, is of brick, three stories high, with a bell tower 80 feet in height, and has already cost nearly \$5,000. In this institution, Colorado has set an example which others of our Pacific States and Territories would do well to follow.

The *Weekly Transcript*, edited and published by Mr. Geo. West, looks carefully after the interests of the place. The *Jarvis Hall Record and Church Monthly* is an excellent publication, well edited by Messrs. G. W. Davies and C. H. Marshall.

The largest and most commodious hotel here, with good bath rooms and other conveniences, is the Golden House, C. S. Abbott, proprietor. There are other hotels here, as the Overland and the Astor.

### Coal Beds.

The Hazelton Coal M. Co. has leased the coal veins in this district for a space of 20 years, and has been working for some time under the superintendence of Mr. E. B. Maltby. They have a shaft down 160 feet

on the vein and are now drifting to the west, working three shifts. The vein they are on averages 8 feet in width. They are now erecting large hoisting works. They have contracted to supply the smelting works with 100 tons daily, furnish the railroad with fuel, and produce a coal which is used by blacksmiths, containing but little sulphur. The company has a capital of half a million, and is developing the coal treasures of the Territory. It controls over 4,000 acres of coal land at Cañon City. It was originally formed in Kansas.

Coal was discovered here some 11 years ago. The formation is cretaceous, and the strata have been tilted up, having a dip of about 80° to the west. In order to give your readers a better idea of the veins, I send you a section of the mining locality, whence are obtained all the supplies for manufacturing, as coal, fire clay, potter's clay, building stone, iron ore and glass sand. For the original drawing I am indebted to Mr. E. L. Berthoud. The drawing is on a horizontal scale of 100 feet, and a vertical scale of 20 feet, to the inch. [Reduced in the engraving to a scale of 270 and 54 feet, respectively, to the inch. Ed.] The following is the explanation of the letters in the drawing:

A is a bed of iron conglomerate; B, layers of potter's clay; C, fire clay; L, hog

SECTION THROUGH CRETACEOUS COAL BEDS AT GOLDEN CITY, COLORADO.

ore; K, glass sand; D, coal vein 5 feet thick; E, coal vein 9 to 12 feet thick; F, coal vein 3 feet thick; G, coal vein 2 1/2 feet thick; H, coal vein 2 feet thick. Between these strata mentioned occur sandstone and clay or sandstone as denoted by the shading.

### Colorado Central R. R.—Proposed Extension.

The Colorado Central is built as far as this place, and two trains are run daily to and from Denver. The road passes through a good country for farming and stock raising. It is under good management. Mr. J. B. Shepherd is superintendent.

The Colorado Central R. R. Co. was organized to build a road from the eastern to the western boundary of the Territory, and was granted a charter in 1865. The road is in running order from its junction with the Kansas Pacific and the Denver Pacific, 3 miles north of Denver, to Golden, 15 miles, and is under construction and location to Central City, 22 miles further.

It is proposed to prolong the line ultimately, via Clear Creek Valley, to Georgetown (the center of the silver mines of Colorado), and over the main Rocky Mountain range, 12 miles N. W. of that town, into Middle Park, near the Hot Springs, thence via Gove's Pass northwesterly to the head of either the White or the Yampa river. Thence, by one of these valleys, to Green river, near the mouth of the Uintah river, up the Uintah to Duchesne River, up Duchesne Fork to Strawberry Valley which it ascends to the summit of the Wahsatch mountains. It will then follow down Daniel's Creek, and Timpanogas river to Provo City, to meet the Cal. Central Pacific, if extended eastward, or else to join the Utah Central at Salt Lake City.

### Comparative Distances.

The following table gives, as near as I can find out, the distances from Golden City to various places on the routes to Salt Lake City by this road and by the one now built.

COLORADO CENTRAL R. R.	
Golden to Central (branch).....	22 miles.
" " Georgetown.....	33 "
" " Summit Berthoud Pass.....	47 "
" " Hot Springs, Middle Park.....	71 "
" " Gove's Pass.....	96 "
" " Green River.....	284 "
" " Duchesne Fork.....	296 "
" " Summit Wahsatch Mts.....	384 "
" " Timpanogas River.....	396 "
" " Provo City.....	415 "
" " Salt Lake City.....	460 "

PRESENT RAILWAY ROUTE.	
Golden to Junction Kansas & Denver Pac. R.R.	15 miles.
" " Cheyenne.....	118 "
" " Ogden.....	718 "
" " Salt Lake City.....	780 "
Difference in favor of Col. Central	
From Golden to Salt Lake City.....	320 miles.
" " Junction to Salt Lake City.....	305 "
" " Cheyenne to Salt Lake City.....	84 "

Moreover, if these figures are correct, there would be a saving of fully 285 miles in traveling by this proposed route from St. Louis to Salt Lake City. I think that the above tables will be found as near the truth as can now be reached. W. H. M.

### The Loss of Quicksilver.

Ens. Press:—Some three weeks ago, C. H. A. asked a very important question relating to the loss of quicksilver—whether it was to be estimated by the ton of ore worked or by the silver extracted. I have waited in hopes that some one of your many experienced readers would answer it, thinking possibly I might pick up some additional information on the subject. As C. H. A. has from time to time contributed articles of much interest to the mining community, I do not think his query should be passed by without attention, and in absence of other response, I propose giving him my ideas, although I must confess

I do not think they will satisfy his demands fully. As my experience goes, if the ore is carefully manipulated, the loss will be per ounce of silver extracted, but close attention being so requisite, neglect often produces a loss, which should not be charged up to the "per ounce" of silver.

My investigations of the loss in the Comstock mills show the average to be about 1 1/2 pounds per ton of ore worked, while it has run as high as 1 1/2 pounds per ton, and I may say, in some instances as low as 1 pound. In other portions of the State of Nevada, and wherever there is lead and copper in the ore, the loss has reached as high as 5 pounds per ton, but this, of course, is exceptional. In the majority of instances, where lead, copper, zinc or antimony is present in the ore, it is sure to equal 2 pounds per ton. The statistics of loss for five years of the Freiberg works show it to be one and one-sixth pounds per ton of ore worked. The Real Del Monte shows 5 1/2 ozs. of loss to every 8 ozs. of silver extracted. The loss of mercury depends on so many things—care in retorting must be included here—that every one really has got to work it out for himself. To work what is popularly termed "rebellious ores," and bring the percentage of loss of quicksilver within the loss of mills working free ores, like the Comstock, is a matter of impossibility. As to the loss in our gold mining, that does not amount to much, as they do not use enough to catch the gold even alone—an evil which, they will learn after awhile, is "holding on to the spicket and letting out at the bung."

In view of the enormous consumption—waste, we may say—of quicksilver, in connection with its high price, it is a subject not to be lost sight of; and I think C. H. A. has done a good service in bringing the question up. ALMARIN B. PAUL.

### Mines and Mining at White Pine.

EDITORS PRESS:—The developments of the last two years in the leading mines situated along the western brow of Treasure Hill, have proved the existence of a large vein of spar of a known length of some three thousand feet. Commencing at a point west of the O. H. Treasure mine, it extends southerly, forming the western wall of both the Ward Beecher and the Aurora North and South mines.

It has many of the characteristics of a true fissure. Its structure is what may be termed banded, being made up of narrow bands or layers running parallel with the walls. The dip is about 45 degrees easterly, the limestone strata having a nearly

corresponding westerly dip, thus showing that it cuts the limestone of the country rock almost at right angles. The same vein, or one supposed to be a continuation of the same from its corresponding character, commences near the north wall on the west side of the Eberhardt, and follows the ridge, running south nearly to the locality of the Mazeppa mine. And here too we find large masses of low grade ore following its course along the east side; but there has been too little done in the way of real development to enable one to determine their importance or value. It is likewise possible that the same spar may continue to the north beyond the Hidden Treasure, and even through the rich mines west of Hamilton; but as the coralline limestone of the south part of Treasure Hill is covered by a thick body of shale on the north, we cannot make the assertion that such is the case until developments prove it.

Nearly all the most important mines in the free metal part of the district are found lying immediately on the east side of this spar, and the opinion is becoming general amongst the most experienced and best informed miners that the main north and south "ore channel" of Treasure Hill will be found accompanying it in an almost unbroken vein throughout its entire length. May we not likewise expect irregular bodies of ore to follow it in depth, possibly occurring only on one side, but more probably alternating from one to the other. This main "ore channel" is crossed at right angles by several east and west lines of deposits, but they differ from the north and south channel in many important particulars, being apparently more superficial in their character. They do not make in depth, but spread out in flat deposits varying from one to twenty feet in thickness. Neither are they accompanied by any defined spar veins.

### Mines.

The mines situated along the spar are, first, the O. H. Treasure. This mine is too well known to require any special description. It is without doubt one of our very best mines, but it has been badly worked, or, more properly, scarcely worked at all. And such might be expected to be the result when we take into consideration that it has had a new superintendent on an average about once every two months, none of them having remained long enough in charge to develop their particular plan for working the mine. It is to be hoped that, for the benefit of this community at least, a better system will be adopted by the owners in the future. Superintendents should have ample time to study the character of the mine they have in charge. The formation of this district is a new problem to most of them, and one that requires its own special solution.

The next mine on the south is the Ward Beecher Cons. This is the latest development in the district, but already gives promise of great value in the future. The first ore was found in this mine at a depth of 80 feet. A perpendicular shaft was sunk 40 feet to the spar vein, which was followed by an incline on its upper side until the ore was found. The present yield is about 40 tons of high grade ore per day. The Ward Beecher of the Eberhardt & Aurora, (limited) London, is a continuation of the last named on the south. It has been worked steadily the year past with constantly improved prospects. It is one of the best mines in the State, and the very best in this district at present. Though not so rich as the Eberhardt was in its best days, yet it far exceeds that famed mine in the quantity of high grade ore already produced, as well as that still in sight. The ore body has been traced in the drift of this mine 300 feet north and south and in connection with the Ward Beecher Cons. a total distance of five hundred feet. Its thickness is sometimes claimed to be as much as 60 feet, but probably the estimate is excessive. Present yield, about 80 tons per day.

The Aurora North, situated to the south of the last named, has never been worked very extensively, consequently it is difficult to form any estimate of what its future may be. But there is good reason to suppose that the body of ore developed in the two last named will be found running through this also. Indeed, the broken character of the surface gives good evidence of the disturbing action of the "ore channel" beneath. Aurora South, for a long time one of the leading mines of the district, is not at present yielding ore in as large quantities as usual, but with the amount of prospecting now going on, we may expect important developments and consequently an increased yield in the near future.

OBSEVER.

Treasure City, July 15th, 1871.

## MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

### California.

#### ALPINE COUNTY.

**MISCELLANEOUS.**—We gather the following items from the *Miner*, of the 15th: The Leviathan is fast establishing a reputation as one of the best paying enterprises in the county. Schenectady Co. has again struck it rich.

**DEEPER—BETTER.**—The last strike in the Tarshish lode adjoining the Schenectady Co., shows better ore than any before found.

**THE GLOBE.**—The ore (copper) in this mine resembles the Levithan and Merimac. One shaft took out two tons, yesterday, on the dump.

Water in a large body has been struck in the Mountain claim.

The furnace of the Monitor & N. W. Co., is now nearly completed. It combines all the valuable features of both the Stetefeldt and Whelpley and Stores furnaces, and it is thought will prove a grand success in smelting the rich ore of the Tarshish.

#### AMADOR COUNTY.

**THE MINERS' STRIKE** has again assumed serious proportions and, at the present time of writing it is difficult to predict what the end may be.

**SALE OF THE MARKLEY MINE.**—The Dispatch of July 22d learns that the Markley quartz mine, near Volcano, was sold on the Wednesday previous to an English company, for the sum of \$35,000. Persons who are acquainted with the mine say it was sold very cheap.

#### CALAVERAS COUNTY.

**MINES AND MINING ABOUT CAMP SECO.**—As this is the dry season, and there is no water to work placer diggings a goodly number of the miners have turned their attention to quartz, with very fair prospects so far, as several very promising lodes have already been struck. Better times are looked for in this section of the county.

**QUARTZ MILL REPAIRED.**—Parties engaged in working the Foot and Thompson quartz lead at Rich Gulch Flat have leased the old French mill, near by, and are having it thoroughly repaired—so says the *Chronicle*.

#### NEVADA COUNTY.

**MINING LOCATIONS.**—*Gazette* July 18th: E. Booth and others have located 21 claims of 100 ft. each on Bald mountain, Euroka township.

Lorine, Heath and others have located 12 claims of 100 ft., each running from the bank of McGuire's creek to the centre of Heath's Hill, Washington township.

**RICH STRIKE.**—Grass Valley Union, July 19th: The Seven-Thirty mine is yielding rich specimens again. The rock coming out is so rich that it is boxed up and put in the vault of Delano's bank.

Same papers say of the Daisy Hill Quartz mine: Several crushings have been taken out, and not one but has paid a good round figure. The last crushing, 15 loads, yielded \$805.37, over \$40 to the ton. Previous crushings have been better. This shaft on the Daisy Hill mine is now down 114 ft.

#### PLACER COUNTY.

**RICH STRIKE.**—The Auburn *Herald* of the 15th, says: On Tuesday last, Johnson & Co. opened a remarkably rich ledge three miles west of here, and near the famous St Patrick mine. They sunk a shaft some fourteen ft. and opened on rock that pays some six or seven dollars to the pound; or, if it holds out, about \$12,000 to the ton. At last accounts, two of the men were quarrying the rock and packing it to the cabin where the other was pounding out the gold by the use of a common hand mortar. This discovery has created quite a sensation.

The St. Patrick mine proves richer as the shaft descends (now down over 200 ft.). The company have purchased the Empire Quartz mill, and are repairing and adding improvements that will make it one of the best gold and sulphuret-saving mills in the State.

The Peter Walton mine, now owned by John McFadden & Co. is about to be reopened. It formerly yielded well. The Shipley mine is down 137 ft., 10 ft. ledge, and looking well; 100 tons of ore out, will pay from \$15 to \$20 per ton, can be worked at company's mill for \$4 per ton.

The Crate Hill mines, 2½ miles west of Auburn, are being developed by an association of capitalists. Fine prospects have already been found. The New York mine at this locality is looking well. Have a 12 in. ledge that will pay about \$40 per

ton. The excitement in this mining section grows more intense each day, and new locations and rich strikes follow each other rapidly.

**GOLD RUN.**—A correspondent of the *Stars and Stripes* says that Bradley & Kinder have completed their tunnel, after two years' work, through which they will run their sluice.

Judd & Co. continue to take out their usual quantity of dust—from \$6,000 to \$8,000 for each 20 days' run. The Brogan mine adjoining, is equally as good. The Kearsarge, owned by H. H. Brown & Co., has paid well; more than any other claim in this district in proportion to expenses. The correspondent claims for this locality the best gravel mines in the State, and Ophir district the richest quartz mines, not excepting Grass Valley.

#### SAN BERNARDINO COUNTY.

**RICH ORE FROM "SNOW STORM" AND "BEATRICE."**—*Guardian*, July 15: McFarland Bros. shipped, to San Francisco last week, 10 tons of ore from these ledges, to be worked in that city. The yield will be from \$500 to \$1,500 per ton. These rich mines, newly discovered, are situated in the famous Clark District in this county. Mr. Mintzer will soon make a similar shipment from his claims in the same district.

#### SAN DIEGO COUNTY.

**BULLION.**—The bullion shipment from Julian District for the week ending July 25th, amounted to \$2,600.

**CLARK DISTRICT.**—The *News* July 22d says: Three tons of selected ore from the McFarland mine, Ivapah, Clark District have been forwarded by Messrs. Brunn & Roe of San Bernardino and will arrive this evening. This firm has already made many shipments giving rich returns; but this last is expected to surpass them all and to establish beyond a doubt the reputation of the Clark District as a rich argentiferous region. Twenty-three sacks of ore from the ledge called "My Mary Anne" have assayed at the rate of \$971.62.

**ON THE SAN GABRIEL.**—The Zapata mine, on San Gabriel river, which has been worked with varying success for several years, is reported as increasing in its promise of prosperity, both as to the width of the vein and the quality of the ore. The placer diggings, also located on the upper San Gabriel, are said to promise well.

The mining operations have so disturbed the waters as to have driven the trout higher up the stream. The favorite fishing grounds now frequented by experts, are to be found on the north fork.

#### SIERRA COUNTY.

We condense from a correspondent of the *Messenger*, as follows:

**MORRISTOWN.**—The mining interests here are flourishing. The Galena hydraulic claim, after being unworked 11 years, was opened this season, and is already paying dividends over wages, without as yet any full clean up. Other mines in this vicinity are also doing well.

Poker Flat is not very lively just now; but strong hopes are entertained of "a better time coming."

**POVERTY HILL.**—But little has been done here, for several years, except to prosecute the work in the various tunnels, searching for the rich leads known to a certainty to exist hereabouts. Brighter days are dawning. The long tunnel below town is nearly finished and will soon be turned to good use. The San Francisco owners are here, and seem well satisfied with their prospects.

The Poverty Hill Tunnel Co. has been 11 years running a hed-rock tunnel, now in about 1,400 ft.

**SCALES DIGGINGS** presents a lively appearance. The miners are doing well.

#### SOLANO COUNTY.

**QUICKSILVER.**—*Recorder*, Vallejo, July 21st: On the Ranch owned by John Brownlie of this place, there is an ore found containing a large amount of quicksilver. Mr. B. has frequently thought working it and has made several assays, but never extended the work to any considerable degree. Now it is proposed to immediately commence the erection of works for that purpose. A kiln of the best quality of brick has been purchased from Mr. Hanks which are being hauled to the ground. The work will be pushed forward with vigor to completion, and the smelting process began.

### Nevada.

#### COPE DISTRICT.

**THE MINES.**—*Elko Independent*, July 22d: The company owning the El Dorado is down 60 ft., and has a five foot ledge, well defined and rich. This lucky company has now a fortune in sight.

The Monitor under management of Geo.

Cartier, is vigorously prosecuting its work upon a four-foot ledge, well defined and very rich. The mine will prove one of the richest in the district.

The Constitution mine is sinking on the ledge at a depth of 30 feet, with a three-foot ledge of good ore, some of which assays as high as \$5,000 per ton.

Pride of the West, is down 85 feet. The men are now running levels through fine bodies of very rich ore, and there is no doubt of this mine being a permanent thing.

The Independent Co., has out about 100 tons of high grade ore waiting for the stamps to be put in the upper mill.

The chloriders are still at work. They have made about \$20,000 within the last three months.

**BULL RUN.**—During the last few days there has been quite a delegation in from Bull Run district procuring supplies, and our merchants have been doing a lively business. The Blue Jacket, Johnson, Ontario and Nevada companies are all taking out large quantities of very rich ore. Gov. Chillis has out a large quantity of the Pound Treasure and Prominent which he will ship to Mountain City for reduction.

**RAILROAD CITY.**—A rich mine.—The first systematic effort to develop this district was by the Hussy tunnel, which runs 80 ft. through a body of silver-bearing galena, the breadth or depth of which no one knows. The ore is undoubtedly rich.

The Elko tunnel is in about the same distance in similar ore.

**GALENA ORE PERMANENT.**—Much distrust was recently felt about the permanency of this galena ore; but those doubts are about removed, and the impression is now general that this will become one of the best and most permanent districts in the State.

**RICH ORE.**—The *Elko Independent* July 22, says that A. J. Rolastone has just shipped 30 tons of ore from the Tripoli Railroad district to San Francisco. The ore assays high up in the hundreds of dollars. He has a large quantity still on the dump which will soon follow. The mine is turning out splendidly.

**A NEW AND RICH MINING DISTRICT.**—A dispatch from Ogden, dated July 10, says: The new mining district on the line of the Central Pacific Railroad, four and a half miles from Tecoma station, is reported to be turning out some ore, ranging from \$45 to \$300 of silver, and \$35 to \$65 of lead to the ton. The Tecoma mine bids fair to be a second Emma. It is now sending ore to the Truckee Smelting Works, which will

#### ELY DISTRICT.

**BULLION—PICOCH,** July 18th: Wells, Fargo & Co. shipped, from July 9th to 14th, through their Agent, B. F. Sides Bullion valued at \$69,518.43

**DEFIANCE.**—The *Ely Record*, of July 2d says this mine has been worked steadily of late and considerable ore taken out. The proprietors, Wilson & Co., are shipping ore to Meadow Valley, and are expecting handsome returns. There are several other mines near by, partially developed. A great obstacle to the prosperity of this locality is the lack of a custom mill near by.

#### EUREKA DISTRICT.

**THE MARCELINA Co.** originally formed in San Francisco, for the purpose of working smelting ores, according to a correspondent of the *Sentinel*, has recently shown signs of life, having lain for a long time dormant. This company built the first furnace on the present Jackson site, and after having completed it made one "run," took a ride over toward Hamilton, and failed to put in an appearance again in this section. At that time the mine was considered worthless, but under the supervision of George Bibbins it soon commenced to show signs of paying ore, and after a few weeks a large body was struck. We trust that somebody will take hold of this property and work it to advantage, as a large amount of money is to be realized.

**THE EUREKA,** after a long probation, is showing signs of a speedy and permanent prosperity. It is impossible to say too much in favor of the Eureka District; as results from actual workings is the best and safest criterion of excellence to be adduced in our favor. Owners of property are constantly coming here—those of the Consolidated, of the Richmond, Tilton, Phoenix, and, in fact, all the companies and corporations here existing.

#### HUMBOLDT.

**BULLION.**—*Silver State*, July 22d: The amount of bullion shipped from the Arizona mine, through Wells, Fargo & Co., since our last issue, was \$11,115.

The Sheha mine continues to show increased rich ore. This mine is now proven to be one of the most valuable in the State, and its lucky owners will ere long realize

handsomely from its embedded treasure.

The Eclipse mine is being vigorously pushed ahead. The tunnel is in 175 ft., progressing a foot a day. The boys are feeling confident of acquiring large fortunes, once the vein is reached.

**ENCOURAGING REPORTS.**—A correspondent of the *Silver State* writes from Galena, July 16th, that at no time since the formation of the district have the indications been better for a prosperous and permanent mining camp. In almost every instance where the water line has been reached on well defined ledges, good prospects have been obtained. The mines are also very generally improving. Several mines have lately made gratifying discoveries.

A new strike on the best defined ledge here, was made recently. The parties owning the mine, after encountering considerable difficulty, were finally rewarded with goodly showing of mineral.

The Copper Co. have found a fine body of ore within the past few days. The Superintendent, Capt. Richards, is now making weekly shipments of copper ore.

The Buena Vista mine, owned by McBeth & Millander, is being steadily pushed ahead. The proprietors have spent much money in fitting up and opening their mine, and deserve a rich and extensive deposit of mineral, as a reward for their nerve and energy.

The White mine is reported to be in a rich body of mineral in the south level and close to the Shiloh line. The latter mine is now ready to commence operations.

#### WASHOE.

**BULLION.**—Gold Hill *News* July 25th: Silver bars to the value of \$28,000 were yesterday received at the Virginia branch of the Bank of California. They were from the Yellow Jacket and Crown Point mines.

Bullion to the aggregate value of \$13,000 passed through Carson Saturday afternoon, from Benton and Independence. About 200 pounds also arrived at the Branch Mint from the southern districts.

**ASSESSMENTS.**—An assessment of \$5 per share has been levied by the Segregated Belcher Mining Co., and \$1 per share by the Buckeye Gold and Silver Mining Co.

**RICH ORE.**—*Virginia Enterprise*, July 19: Some very rich ore is said to be coming out of the Gould & Curry at present. We understand that it comes from the second station, and the Savage Co. are digging in the same direction with excellent success. It is also reported that a body of ore assaying some \$700 per ton has been cut into in the Crown Point.

**SUTRO TUNNEL.**—The Sutro Tunnel is 2,247 feet. The ground is working very well. There are now seams of quartz in the face of the tunnel.

**CHOLLAR.**—The Chollar Company are taking out 200 tons per day. The mine looks as well as ever throughout and there is ore in sight everywhere.

**LADY BRYAN.**—The ore breasts of this mine continue looking and yielding excellently, and the mill of the company is reducing about 30 tons of ore per day on the average.

**KENTUCK MINE.**—This mine continues to yield an abundance of fine ore on the 600 and 700 foot-levels. They are opening out on the 400-foot level and getting it in shape for taking out ore whenever it may be thought advisable to do.

### Arizona.

**RECENT DISCOVERIES.**—Recently, says the San Bernardino *Guardian*, there has been discovered in the Hualapai District, Arizona, some seventy or eighty ledges of mineral, gold, silver, copper and lead, in paying quantities. The ore in the leads have been assayed and go from \$70 to \$2,000 per ton. The road from this place to Ft. Mojave, and this District, has recently been worked and placed in good condition with plenty of water and grass on the route. The hill known as Piute, Hill has been graded and improved. The whole work has been performed through the perseverance and instrumentality of that indomitable Arizonian, Mr. William H. Hardy.

### Colorado.

**CARIBOU.**—New discoveries continue to be reported in this district. The *Post* says Chas. A. Barstow and associates, within the last few days have discovered a gold lode, near the town, from which the first test showed gold at the rate of \$500 per ton; the second \$900.

Eleven distinct discoveries are reported by the *Post* in one week.

**RICH ORE.**—Lesh & Bernham within the week, have opened their claim to the depth of 17 ft., at which point they have found ore exceedingly rich—"half as good as Mexican dollars."

**SUMMIT COUNTY.**—Col. Candler, of the Boston Silver Mining Association, has several wagon loads of machinery, etc., on the way to Breckenridge. The works being constructed by this company will be complete, combining amalgamation with smelting, and of 20 tons capacity per day.

This county contains 125 miles of ditches, and 50 miles more will soon be commenced. Prospecting has been very brisk during the summer, and many good gulches have been found.

Blue River has been more or less worked for 20 miles of its length. Many rich spots have been found since '50, but of late not much over expenses have been realized.

**CLARK COUNTY—MILL CITY.**—The work of development goes on in the mines about Georgetown. Prospecting is pretty much suspended. The present work is being done in old and well-known lodes. The Capital lode, in Ohio Gulch, is giving employment to nine men. The developments are very satisfactory. The Mohawk, and Wild Wagoner, are doing well.

Riley, Gilliam & Jones have recently discovered and are developing the "4th of July" lode on McClellan mountain. They report progress. The character of the ore is gray copper, brittle silver, carbonate and sulphuret of copper, mixed with fluor spar. It looks very rich; assays show \$891 per ton.

**Idaho.**

**FROM THE BASIN—CHRISTIE GULCH.**—The World of July 13th: The old Christie Ditch, better known as the "Big Ditch," belonging to the Buena Vista Bar Co., has been connected with the old Dunn ditch, so as to afford the Co. a larger supply of water at their extensive diggings on the bar.

**BOYLE'S GULCH—A NEW DISCOVERY.**—The same paper is informed that a new quartz lode, which prospects very rich, has recently been discovered near Boyle's gulch about one and a half miles from Placerville. It was accidentally found while piping on Petersons & Weiss' claims and discovered to be a well defined lode of about three feet in width, filled with decomposed gold quartz; 1,400 feet, were located and work will be commenced thereon next week.

**Montana.**

**THE BOULDER COUNTY.**—Mr. Devine, of Boylis Gulch informs the Independent of Virginia City, that Messrs. Carr & Co. are making \$20 per day to the hand. Devine & Co. are rigging a wheel, with which they hope to reach the bed-rock in the main boulder, which is supposed to be rich.

**OPHIR BAR.**—The Helena Gazette says that claims on Ophir Bar pay from \$10 to \$25 per day to the hand. There are some 12 companies on the bar.

**OPHIR GULCH.**—Claims in Ophir Gulch are also doing well.

**PILGRIM BAR.**—Among the clean-ups on Pilgrim Bar last Sunday, says the *Montanian* of the 15th inst. were Holcomb & Berry, \$4,190; Brelsford & Co. \$1,190; Roe & Bell, \$2,000; Steele & Co., \$1,050. Brown & Blakeley, who have the extension of Pilgrim Bar south, struck it last week and cleaned up 19 1/2 oz. from one box. This strike has had quite a good effect on mining property in that vicinity. Wilbur & Co. on Independence Bar cleaned up, for three consecutive weeks, \$350, \$500 \$750. Jas. McMasters cleaned up \$350 in three days, and was expected to take out \$1,000 during the next week.

**Utah.**

**SALT LAKE CITY,** at the present time presents a scene of busy life, and *bullion* seems to be the crowning feature of the city and country at present. Vest monuments of it in various localities giving proof of the steady, onward progress of mining interests in Utah.

**MINE SELLING** seems also to be a good business, as nearly every mine which can be had at fair figures finds a ready purchaser among the capitalists, who are constantly flocking to that region.

**THE EMMA MINE,** says the *S. L. Tribune* is par excellence the mine of Utah, and is doing more than is generally supposed. It is turning out on an average 100 tons of ore per day, worth \$135 per ton, over and above all expenses, making the handsome sum of \$13,500 net profit for every 24 hours. This multiplied by 365 gives the astonishing product of \$4,927,500 per annum! It requires a hundred hands to get this ore above ground, besides a large number that are employed in timbering.

**THE REVOLUTION MINE** in Little Cottonwood, is developing with encouraging results. It is the oldest location on Emma Hill. A large vein of chloride assaying

from \$133 to \$250 per ton, has been reached, and the amount of mineral is unquestionably large. It bids fair to become one of the big mines of Little Cottonwood. The fortunate owners are Harlow, McKay and Howland.

In the Davenport mine a 16-foot vein was struck a few days ago. The owners had been offered \$75 per foot before the last discovery, which amounts to \$90,000 for the mine. The figures we understand will have to be increased now.

**THE PROVO MINE.**—A fine lump of ore, weighing 230 pounds, from this mine, is to be seen at Wells, Fargo & Co.'s. The body of ore in this discovery, is 24 feet wide, and up to the present no wall rock has been found. Assays give \$227.70 in silver to the ton, with 69 per cent lead; 25 tons are already on the dump, and it is the purpose of the owners to commence the shipment of ore as soon as their trail is finished—so says the *News*.

**CHURCH DIGNITARIES GOING INTO MINING.**—The *Tribune* says that a new mining company is being formed to operate in Provo Valley, comprised of Church dignitaries amongst whom the name of A. Milton Musser appears prominently. This appears to be a "New departure" on the part of Mormon Church dignitaries, who have heretofore refused to have anything to do with the developing of the mines.

**SNAKE RIVER.**—Reports from this region and from Stockton are very favorable. Stockton is developing some famous mines. They have now a smelting furnace there which is reliable and doing well. The mines there it is thought when fully opened may keep a number of furnaces in operation.

FROM OPHIR word comes that the new furnace erected by the Ophir Co. is still pouring out the bullion. It fired up the first time on Wednesday, the 4th inst., and up to date continuously run with no sign of "stop." It is an immense success, being used without admixture with other ores fluxes, and the bullion assays \$143.50 per ton. Daily smelting is being made successful, and Utah is being aggrandized by its mineral productions.

**Cinchona.**

The Agricultural Bureau at Washington, are cultivating with apparent success, from importations from the British Governor of Jamaica, a quantity of these (Peruvian bark) trees, and will have some 2,000 to transplant and distribute in January. They will not bear over two degrees of frost. Elevated ground free from frost is preferred. We think that California offers a very desirable field for their culture, and hope our State will share liberally in the contemplated distribution, although its quota be necessarily delivered at a more favorable season for transit over the mountains. Seed for this tree could doubtless be secured by application to His Excellency, W. A. G. Young, Colonial Sec'y, Kingston, Jamaica, W. I., or to U. S. Consul Runsey, Quito, Ecuador, South America. Instructions for cultivating would doubtless be given freely by those gentlemen. It certainly would by the department at Washington.

**Japanese Persimmons.**

The Department of Agriculture at Washington, is cultivating 75 persimmon trees brought from Japan by Capt. Ammen. They were taken overland from San Francisco, and although they met with a delay of three days in our custom house, every tree lived and appeared to be thriving when we saw them recently. This fruit in Japan is said to be equal in size to apples and superior to our American persimmons.

**PIONEERS AND SUTTER'S FORT.**—A '49 Pioneer, in the *Calistoga Tribune*, suggests that the various Pioneer Societies in the State unite to the purchase of the site of Sutter's Fort, at Sacramento, with the view of restoring its broken down walls and fitting it up as a place of public resort and infirmary for indigent pioneers. The site, if not thus rescued, will soon be cut up into city lots, and the last vestiges of its walls destroyed. The City Street Railroad will soon be extended to the locality, and there is no question but that the speculation could be made to pay for itself, if it was so desired. The suggestion is an eminently proper one, and most timely.

**Mining Stock Market.**

(San Francisco Stock and Exchange Board.)

THURSDAY EVE., JULY 27, 1871.

There has been considerable fluctuation in stocks during the past week. Eureka, which has been falling for quite a number of weeks and has lately gone down rapidly, has sold this week for \$28 1/2 to \$21. Anadior has been quoted at \$300 to \$260.

**Savage M. Co.**

We have received the annual report of the Savage M. Co. for the year ending July 10th 1871. We extract the following from the superintendent's report:

Amount of ore extracted.....	39,716 tons.
" reduced.....	38,147 "
" sold.....	802 "
Average yield per ton of ore reduced.....	\$21.45
" cost per ton of production.....	\$11.06
" cost per ton of reduction.....	9.95 21.01
Average profit per ton.....	0.42
Total product of mine.....	\$827,230.46
Cost of extraction and reduction.....	818,719.78
Total profit.....	\$8,510.68

The average assay value of the ore reduced was \$32.73 per ton, and the average yield was 65.5 per cent. of this value. The proportion of gold and silver in the ore was 27.8 gold to 72.2 silver; in the bullion, 31.8 gold to 68.2 silver. The percentage returned of gold and silver contained in the ore was 75.0 gold and 61.9 silver. The average value of the bullion after melting was \$1,83 1-10 per oz., and the loss of weight in melting 2.9 per cent.

The superintendent says: "The future of the mine must be determined by reaching a greater depth. Without doubt considerable ore yet remains in the upper levels; but at this time we have no knowledge of any extensive body of ore in any part of the mine."

**QUOTATIONS.**

The following table gives last Thursday quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock during the week.

July 20 Highest.	Lowest.	July 27.	Adv.	Dec.

**Leather Market Report.**

[Corrected weekly by Dolliver & Bro., No. 109 Post st.]

SAN FRANCISCO,

## PATENTS & INVENTIONS.

### Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

#### FOR THE WEEK ENDING JULY 11TH.

MEDICAL COMPOUND OR BITTERS.—Ahram M. Loryea, East Portland, Oregon.

PRINTER'S GALLEY-REST.—John M. Murphy, Olympia, Washington Territory.

GANG-POW.—William Hay and Thomas B. Freeman, Hillsborough, Oregon.

SHINGLE MACHINE.—Oliver A. Olmsted, Sebastopol, Cal.

CURTAIN FIXTURE.—Lodowick L. Sawyer, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

### The State University.

Last week we had the pleasure of visiting the chemical and physical laboratories of the State University. We had heard that some of the very extensive chemical apparatus, (purchased some years ago in Germany by Professor Fisher for the University) had been unpacked, and Prof. Carr very kindly gave us the opportunity on inspecting the laboratories.

It would fill up a very large portion of our space to enumerate the articles which we saw, which comprise full sets for qualitative and quantitative analysis of solids, liquids and gases, (the last to a certain extent). Vessels of glass, porcelain and platinum, of every kind, a large assortment of the rarer and more difficultly obtainable chemicals, everything necessary for a complete laboratory, are here collected. Only a part of the apparatus has been unpacked, and we were shown the exterior of numerous boxes stored away in different places, whose contents are yet undisturbed. It is therefore very difficult to make comparisons of the amounts here and elsewhere, but we can at least say that we very much doubt whether any institution of the country has a larger collection than has the State University.

This apparatus is intended for all the various colleges of the University, agricultural, mining, medical, mechanical and classical, and hence its large size. It would appear as if the equipment of such a laboratory as Bunsen's, in Heidelberg, had been taken in part as a guide for its collection.

We were also shown considerable apparatus for assaying, drawings of metallurgical apparatus, and the basis of a mining library. We were next shown a collection of physical apparatus, some of it very excellent, made by Prof. John LeConte.

In the technological department were several sets of materials, showing the various substances and reagents employed in powder manufacture, sugar making, wood preserving and artificial stone manufacture (Ransome's), and illustrating the various stages of each process, forming very interesting collections.

A large geological collection and a number of cases of minerals were likewise viewed. We saw enough to convince us that the University has sufficient equipment in these respects for full courses of study; and we likewise saw that it has not yet sufficient room for the proper arrangement thereof. Prof. Carr has, we understand, been occupied for some time in arranging what is now visible, and he has yet plenty of work to do. We believe that he has no assistant (we omitted asking him), but certainly he must need one, as the calls upon his time are very numerous,—more than any one man can properly respond to. For his kindness in devoting several hours to us, we are indebted to him,—and just as deeply indebted as if it were not vacation for the students.

### The Yosemite Valley.

A statement has been published, said to have been made by Galen Clark, Guardian of the Mariposa Grove and the Yosemite Valley, which shows that the State ought to do more for the preservation of these places. The Legislature of 1865-6 made an appropriation of \$2,000, which was to last two years and to pay all expenses incident to taking charge of the Valley and Grove. There are eight commissioners, it will be remembered, and all their traveling expenses, printing, building two bridges, etc., etc., were to be paid for out of this sum. Mr. Clarke was to receive \$500 per year for himself and a sub-guardian, or \$250 each. This has not been paid since 1867.

Some complaint having been made with

of justice. We join him in the expressed wish that action should be taken for improving the Grove and Valley. There is a most urgent necessity therefor.

These two localities ought to be well preserved. They were given to the State with the understanding that they should be. The State dare not be meanly parsimonious in the matter, for parsimony means destruction of many of their chief beauties. If the State is unable to take care of them, then she should re-convey them to the United States. Indeed, it would be better that they should be kept in proper condition as private property, than injured through public neglect. The good condition of the Calaveras Grove shows that they can be preserved. But the State ought to own them and to care for them. We hope the next Legislature will set all this matter right.

#### The Yosemite Falls.

In connection with these remarks, we

NEAR VIEW OF THE YOSEMITE FALLS.—2,634 FEET IN HEIGHT.

From a Photograph by C. L. Weed.

regard to tolls charged at the Valley, Mr. Clark explains that a bridge over the Merced and a series of ladders and a trail leading up to the Nevada and Vernal Falls were considered a necessity. The commissioners had no money for them. They therefore allowed them to be built (and toll charged) with the understanding that the State can purchase them at any time at a valuation which is to decrease every year; and at the end of ten years they revert to the State if not purchased beforehand.

While we were at the Mariposa Grove last month, we noticed with pain the ravages made by fires. It now appears that Mr. Clark spent eight days last year, and undoubtedly more previously, in checking fires. What we saw was probably the result of previous fires.

Mr. Clark distinctly disclaims any desire to make complaints against the State for arrears of salary, due him. But we, although we have never seen the gentleman, do complain of this on the very principles

of justice. We join him in the expressed wish that action should be taken for improving the Grove and Valley. There is a most urgent necessity therefor. These two localities ought to be well preserved. They were given to the State with the understanding that they should be. The State dare not be meanly parsimonious in the matter, for parsimony means destruction of many of their chief beauties. If the State is unable to take care of them, then she should re-convey them to the United States. Indeed, it would be better that they should be kept in proper condition as private property, than injured through public neglect. The good condition of the Calaveras Grove shows that they can be preserved. But the State ought to own them and to care for them. We hope the next Legislature will set all this matter right.

ASPHALTUM BEDS.—Says the Gilroy *Advocate*: By the kindness of James P. Sargent, Esq., we were enabled a few days since to visit the remarkable asphaltum beds located in the Juristo Rancho, about four miles from Gilroy, owned by Sargent & Bros. These beds cover about twenty acres of land, have over a thousand springs upon them, and yield in large quantities a superior quality of asphaltum. They have produced over five hundred tons this year. The same parties have an asphaltum bed of six hundred and forty acres in Los An-

geles county, which they intend to have worked in a short time. The Sargent Bros. are carrying on an extensive business, not only in the production of asphaltum, but also in stock dairies, etc. They own in all about 50,000 acres of land. They have at present 15,000 head of cattle, and 300 head of horses, mares and colts, among them some of the finest stock on this coast.

### A Coal Mine on Fire.

The Philadelphia *Bulletin* describes the ineffectual efforts made to extinguish a fire in a coal mine in Pennsylvania, which was in progress in 1858. It says: The miners had as yet had no experience, and a very simple, in fact entirely too simple, means of extinguishing the fire was adopted.

A dam of timber was built across the gangway, of but little more strength than a partition between two rooms. This was intended to retain the water and back it upon the fire, which would then certainly be extinguished by it. The theory was good, but, unfortunately, when the water rose to a considerable height, the dam gave way before the pressure. A second dam was immediately erected, but met with the same fate. It was then decided to build a dam which could not be hurst by all the pressure that could be brought to bear on it by the waters of the mine. Four feet were cut out of the solid coal in the top, sides, and bottom of the gangway, and a solid structure of oak, strong as a canal lock, was erected, and clay packed in behind it for the space of ten feet. The water backed up against this, but now the water was not the agent of destruction. The fire had made a detour through the coal, and had enveloped the dam on all sides, save one, and on that was the water. No human structure could exist in such a conflict of the elements. It was earth against fire, water and air, and earth succumbed. The dam having given away, the fire soon reached the mouth of the slope, and the hopes of extinguishing it were given up. Since that time the mine has been closed. The fire will soon burn out, but will certainly not be extinguished in any other way. Occasionally small tracts of land fell into the fiery furnace below. The effects of the fire and its accompanying heat are almost as well shown here as at Vesuvius or Aetna. The rocks are baked, and are of many shades of color; they have changed their stratified position, and are inclining in every direction. But perhaps the most interesting of all are the changes wrought in the rocks containing iron pyrites. The pyrites have been heated in the proximity of steam, which causes them to be soluble in water; they have then been dissolved out of the rocks, leaving perfectly cubical, glazed cavities in the solid rock, giving to it a honeycombed appearance.

CALIFORNIA GEOLOGICAL SURVEY.—The Loudon *Saturday Review*, of June 24th, gives a very flattering notice of our State Survey, which we are obliged to condense. It says: Often as we have noted the important and elaborate works compiled by official authority, at the public expense, whether by State or Federal Government, on subjects which in other countries, and especially in England, are left to the disinterested and unremunerated industry and zeal of individual men of science or of voluntary societies, we do not remember any series equal in its prospective extent, and in promise of value and completeness, to the so-called "Geological Survey of the State of California." That survey, "though called geological, was intended to embrace the natural history and topography of the State, as well as its geology." Conceive such a work undertaken in this country at the public expense, and carried out on a scale of which absolute perfection would appear to be the aim, and exhaustion of materials the only limit, by the co-operation of the ablest men in each branch of knowledge! Of the manner in which the work ordered by the State of California is being executed, we have an example before us. If each department of Natural History is to be completed in the same style, the work will be one of the most perfect, in relation to its limited scope, that the world has seen. \* \* \* The elaborateness of the work, and the pains-taking visible in its execution, are remarkable; and having been submitted to the revision of eminent ornithologists, its accuracy may probably be relied on. This specimen will certainly induce all who see it to watch with interest and curiosity for the other volumes of the series; while the example of Californian liberality may be commended to the consideration of certain highly-placed and influential English "Liberals."

## New Publications.

**SORGHUM AND ITS PRODUCTS.**—An account of Recent Investigations concerning the Value of Sorghum in Sugar Production, together with a Description of a New Method of Making Sugar and Refined Syrup from this Plant. Adapted to Common Use. By F. L. Stewart. Philadelphia: J. B. Lippincott & Co., 1867. 8vo., pp. 240. For sale by Dewey & Co., 8 F.

The supply of Southern cane sugar has been gradually decreasing of late years, while the demand for sugar is continually increasing. As the sugar cane cannot be grown except on a limited belt of territory along the shore of the Gulf of Mexico, other sources of supply have been sought. The Northern sugar maple is utterly inadequate. The manufacture of beet sugar has not been fully tested throughout the United States, although we have great hopes in California of its success, and we may here allude to articles in the Press on melon sugar. But the greatest attention of the country generally has been called to a plant which seems as adequate to supply us in futuro with sugar, as, in the few years since its introduction, it has proved itself capable of providing half the tables in the land with a rich and palatable syrup. This plant is the sorghum. It is called by botanists the *sorghum saccharatum*, all the different kinds being recognized as varieties of one species.

The publication of this volume comes therefore most opportunely. It is written for the benefit chiefly of the farmers and planters who foster this branch of industry, and it is written in such a manner that they can understand and use its contents. It is comprehensive in its scope, treating of the method of planting and cultivation, with full instructions at every stage of the process, of manures, soils, effects of climates, harvesting and storing the cane, the process of manufacture, description of mills, re-agents and processes, etc., etc. It treats also of other sugar producing plants.

**THE ILLUSTRATED HORSE DOCTOR.**—Being an accurate and detailed account of the various diseases to which the Equine Race are subjected, together with the Latest Mode of Treatment, and all the Requisite Prescriptions. Written in Plain English. With over 400 Pictorial Representations. By Edward Mayhew M. R. C. V. S., Philadelphia: J. B. Lippincott & Co., 1871. 8vo., pp. 522. For sale by Dewey & Co.

In this book, which is lavishly illustrated, Mr. Mayhew has sought to give to the reader directions which will direct the uninitiated in the primary measures necessary to meet the progress of disease, and which, when professional assistance could not be obtained, might even instruct the novice how to treat equine disorders in such a manner as would afford a reasonable prospect of success. He has also sought to show that cruelty is an extravagant indulgence. He says:

In the writer's conviction, humanity toward animals should be more commonly practiced—if not from any higher motive, because it is certainly the truest economy. To make this fact plain is the intention of the present publication. To prove that horses are gifted with something beyond the mere sensation which is common to all moving things, is the object of the present work. To convince the public, by appealing to the eye and to the understanding through the means of engravings and of letter-press, that the equine race inherit higher feelings than the vast majority of mankind are prepared to admit, is the purpose of the book now in the hands of the reader. To demonstrate how closely nature has associated man and horse in their liabilities and in their diseases—to induce men, by informing their sympathies, to treat more tenderly the timid life which is disposed to serve and is also willing to love them—is the highest reward the author of the following pages can picture to himself.

**CROFUTT'S TRANS-CONTINENTAL TOURIST'S GUIDE**, containing a full and authentic description of over 500 Towns, Villages, Stations, Government Ports and Camps, Mountains, Lakes, Rivers, Sulphur, Soda and Hot Springs, Scenery, Watering Places, Summer Resorts; where to look for and hunt the Buffalo, Antelope, Deer and other game; Trout Fishing, etc., etc. In fact, to tell you what is worth seeing—where to see it—where to go—how to go—and who to stop with while passing along the Union Pacific Railroad, Central Pacific Railroad of Cal., their Branches and Connections by Stage and Water from the Atlantic to the Pacific Ocean. Sold by periodical dealers throughout the United States and in European cities. Sent prepaid by Dewey & Co. for 75 cents; bound, \$1.25.

The above title gives a description of the character of the third volume and second annual revise of this progressive publication, edited by Geo. A. Crofutt, publisher, who has spent years of active and adventurous life in the heart of the wild country portrayed by him in a natural and pleas-

ing style, not in the least dry to the traveller on his way or the home reader who is made to roam with truthful fancy over the longest and most excitingly interesting railway line in the world. Mr. Crofutt makes this publication his regular business, passing over the route and adding new material and improvements to his work constantly. It is now illustrated by over forty engravings. A large and complete colored lithograph map of the world shows the principal routes of travel, and very prominently the lines of a voyage around the world and time and cost of the only truly round trip which travelers make. The map is worth more than the price of the book, for wall or pocket use. We have a bound copy worthy of any library, and must say this book differs from many "guides" in being worthy of preservation and worth buying to those who do not travel the route.

## Lake Superior Iron Mines.

We have received a very interesting pamphlet on the mines and furnaces of the Lake Superior Iron District, written by A. P. Swineford, the able editor of the *Marquette Mining Journal*. A few items from the work may interest our readers.

The iron ores are generally found in hills, rising from 100 to 500 feet above the level of the surrounding country. These hills are simply immense deposits of iron ore, though partially or wholly covered by layers of earth and rock. The ores are also found in the valley, but where so found are usually covered with a deep drift, which renders their extraction more difficult.

There are five varieties of ore: specular hematite, yielding 60 to 70 per cent. of slightly red-short iron; soft hematite, yielding about 55 per cent.; magnetic ore; "flag ore," a slaty, siliceous hematite; and a siliceous ore containing a variable amount of oxide of manganese.

There are 24 mines in operation, 16 blast furnaces, and one rolling mill. All but one furnace run on charcoal. All are hot blast and all but three have steam power. From 1856 to 1870, inclusive, there were produced 3,771,939 tons of ore and 243,460 tons of pig iron, valued at \$29,069,883. The average cost of extracting the ore is estimated at \$2 per ton.

The work gives a history of the district, and contains throughout interesting and valuable matter.

**TULARE COUNTY SODA SPRINGS.**—A correspondent of the *Bulletin* describes the McRelvey soda spring, situated on the north side of the south fork of Tule river, which delivers about sixty gallons of soda water per hour. It bubbles up continuously, is as strong as almost any one would wish, and too strong for some, until they let it remain in the cup a moment, and, I think, quite as good as artificial soda water, if sweetened with syrup, though most people prefer it without sweetening. It contains some iron, but not enough to spoil the taste. There are several other springs near by, some of which I think contain sulphur. There is also a spring on the north fork of Tule river, where, I am informed, hotel accommodations are to be had this summer. They call it Mount Tahor Soda Spring. It is not so strong with gas, but has more sulphur in it. With these healthy plains to live on in winter, and the soda springs as a summer resort, settlers will yet settle upon and irrigate this land, making Tulare county the Paradise of California. We have no mosquitoes, fleas or other pests of that kind to bother us.

**THE CALIFORNIA ELASTIC CAR WHEEL.**—We have seen several certificates of recommendation for the above invention of Dr. A. F. Cooper of this city. His wheels, originally illustrated in the *SCIENTIFIC PRESS*, have been in use for over twelve months, and the endorsements of their merits for utility and durability are by officials of railroads leading out of Boston, where the inventor now resides.

**POISON IN THE CLOTH.**—A dressmaker was poisoned to death a few weeks ago by making up a green tarlatan dress. So much of the arsenic entered the pores of her skin that she died a few days afterward.

## GOOD HEALTH.

## Conditions of Comfort.

Every day we meet with persons who in their families are cross, ill-natured, dissatisfied, hating fault with everybody and everything, whose first greeting in the breakfast room is a complaint, whose conversation seldom fails to end in an enumeration of difficulties and hardships, whose last word at night is an angry growl.

If you can get such persons to reason on the subject, they will acknowledge that there is some "want" at the bottom of it; the "want" of a better house, a finer dress, a more handsome equipage, a more dutiful child, a more provident husband, a more cleanly, or systematic, or domestic wife. At one time it is a "wretched cook," which stands between them and the sun; or a lazy house-servant, or an impertinent carriage driver.

The want of more money than Providence has thought proper to bestow, will be found to embrace all these things. Such persons may feel assured that people who cannot really make themselves comfortable in any one set of ordinary circumstances, would not be so under any other. A man who has a canker eating out his heart, will carry it with him wherever he goes; and if it be a spiritual canker, whether of envy, habitual discontent, unbridled ill-nature, it would go with the gold, and rust out all its brightness. Whatever a man is to-day with a last dollar, he will be radically, essentially, to-morrow with a million, unless the heart is changed.

Stop, reader; that is not the whole truth, for the whole truth has something of the terrible in it. Whatever of an undesirable disposition a man has to-day without money, he will have to-morrow to an exaggerated extent, unless the heart is changed; the miser will be more miserly; the drunkard more drunken; the debauchee more debauched; the fretful still more complaining.

If you are not comfortable, not happy now, under the circumstances which surround you, and wish to be more comfortable, more happy, your first step should be to seek a change of heart, of disposition, and then the other things will follow—without the greater wealth! And having the moral comfort, bodily health will follow apiece, to the extent of your using rational means. Bodily comfort, or health, and mental comfort have on one another the most powerful reactions; neither can be perfect without the other, at least, approximate to it; in short—Cultivate health and a good heart; for with these you may be comfortable without a farthing; without them never, though you may possess millions!—*Hall's Jour. of Health.*

## Medicinal Qualities of Pumpkins.

At a recent meeting of the the New York Farmers' Club, a correspondent wrote of the virtues of the pumpkin, giving the following instance of its value for inflammatory rheumatism:—A woman's arm was swelled to an enormous size and painfully inflamed. A poultice was made of stewed pumpkins, which was renewed every fifteen minutes, and in a short time produced a perfect cure. The fever drawn out by the poultices made them extremely offensive, as they were taken off. I knew a man cured of severe inflammation of the bowels by the same kind of application. I think such subjects as this proper for discussion in a farmers' club.

Dr. Snodgrass:—I have no doubt pumpkins make a good poultice. Whatever holds warmth best is the most suitable.

Dr. Smith:—In my travels in Syria I found pumpkin seeds almost universally eaten by the people on account of their supposed medical qualities—not because they are diuretic, but as an antidote against animalcule which infest the bowels. They are sold in the streets as apples and nuts are here. It is a medical fact that persons have been cured of tapeworm by the use of pumpkin seeds. The outer skin being removed, the meats are bruised in a mortar, into an oily, pasty mass. It is swallowed by the patient after fasting some hours, and it takes the place of chyle in the stomach, and the tapeworm lets go its hold on the membrane and becomes gorged with this substance and in some measure probably torpid. Then a large dose of castor oil is administered, and the worms are ejected before they are able to renew their hold.

**SINGULAR CASE OF BLOOD POISONING IN BOSTON.**—Mr. John Suow, engaged in the fish business on Commercial wharf, recently had the misfortune to cut the top of the thumb on his right hand with a large and sharp knife which he was using. After applying a simple dressing to the wound, which bled profusely at the time, scarcely anything else was done to it, and Mr. Suow continued to attend to his business. On returning home last Wednesday evening he complained of severe pain in his hand and arm. During the night the severity of the pain increased, and inflammation setting in. Dr. Hall was summoned, who, after making a careful examination, discovered that the matter which had formed around the wound had been absorbed by the blood and consequently was circulating through the patient's system. The physician treated the case in the usual manner, but without any beneficial results, and the man continued to suffer apparently

in great agony until last Saturday night, when death ensued. A consultation was held by several medical gentlemen, who stated that death resulted from pyæmia.—*Boston Transcript.*

## Sunshine in Dwellings.

The time will very likely come when sunshine, or sunlight, will be so utilized as to be the entire remedy used for very many diseases. That it is a wonderful vitalizer, none can doubt who know anything about it.

But how many houses are constructed with a view to getting all the sunshine possible, especially when so much needed as in winter and spring? The living, or sitting-room, at these seasons of the year, at least, should have a full southern exposure, with large windows to let in the sunshine. Sleeping rooms, wardrobes, closets, passage ways, should receive the cleansing, vivifying influence of the sun. Sickly persons should court the sunshine as much as possible,—sit in it, lie in it, luxuriate in it. It doesn't cost anything, only appreciation.

A room warmed neither by the sun nor by fire, is unhealthy, and not fit for human habitation. It is a poor theory that sends men, women or children off into a cold room to sleep, on health principles, when warmth has been excluded for a day or a week, or perhaps months. The change in the temperature of a room, having both fire and sunshine, after the sun goes down, is exceedingly marked. A perceptible chill is felt.—*Ec.*

## To Avoid the Ague.

The first suggestion, of course, is to leave those districts where this troublesome complaint prevails. Sometimes, however, one's residence cannot well be changed. To persons so circumstanced, there are preventions by the use of which the majority might generally escape it, which are referred to in the *Journal of Health* as follows:

1. Avoid exposing themselves to the malarial air after sunset and before sunrise.
2. Occupy rooms at night on the sunny side of the house and up stairs.
3. Build a fire in the house as soon as the dew begins to fall. The heat of the fire will do much to kill the malaria.
4. Keep the skin healthy and active by a thorough bath every day on rising, in a warm room, with sufficient friction to produce a healthy reaction.
5. Keep the bowels open by a proper diet. In nine cases out of ten the cause of ague would be easily overcome if the depurating organs were not overtaxed and morbid matters allowed to accumulate in the system to oppress it.

**WHAT IS THE CAUSE OF SO MUCH LOSS OF LIFE.**—What is the deeper cause of this wide spread and lamentable destruction of human life; and, if remediable, how is it to be remedied? Obviously, the cause is want of the mental capacity of self-protection, and the sole remedy is to supply that want, which is the true work of education. We hear of the instinct of self-preservation, but the idea is erroneous; there is an instinct of love of life, but self-preservation is an affair of the reason and of knowledge. Again, there is much said about the injurious consequences of breaking the physical laws, but this also is a mistaken notion. It is not the physical laws that are broken in these cases, but the laws of reason; while the great mass of accidents from which people suffer, are simply the penal consequences of loose thinking.

**WORTHY OF CONSULTATION.**—The "*Manufacturer and Builder*" says that the best article for spectacles is crown-glass. Glasses of Brazilian pebble transmit to the eye the rays of heat, which form 70 per cent. of solar light and much more of artificial lights. Good crown-glass, free from lead, is much less permeable to heat rays and therefore less injurious.

**MOST HEALTHFUL SEAT IN A CAR.**—Other things being equal, the forward seats in a street or railway car are the most healthful. The forward motion of the car causes a current of air backward, carrying with it the exhalations from the lungs of the forward passengers. In all cases avoid as much as possible inhaling another's "breath."

**LEMON FOR A COUGH.**—Roast the lemon very carefully without burning it; when it is thoroughly hot, cut and squeeze into a cup upon three ounces of sugar, finely powdered. Take a spoonful whenever your cough troubles you. It is good and agreeable to the taste. Rarely has it been known to fail of giving relief.

To Clean Marble; Tomato Beer; To Green Cucumbers; Domestic Receipts; Mechanical Hints.....	58
Guide and Catalogue of the Fair.....	60

## A Destructive Fire.

On Saturday last a destructive fire occurred among the manufacturing establishments on Fremont and Mission streets. The buildings here being occupied to a large extent by wood-workers, the fire rapidly made headway and was only overcome after a large amount of ground had been burned over.

The loss of the Mechanics' Mill, whose buildings, machinery and stock on hand were completely destroyed, is set down as \$40,000. Howland & Co.'s ore-reducing works were also destroyed, and the loss here is given as \$50,000. B. F. Freeman, stair-builder, lost machinery, patterns, etc., of the value of \$10,000. The fire extended to the Pacific Boiler Works, which lost stock and machinery to the amount of \$10,000. J. M. Stockman lost \$7,000 worth of patterns, machinery and stock.

The largest loss, however, was that of Garratt's brass foundry, occupying four buildings, including foundry, bell foundry, finishing shop, and store house. This is estimated at nearly \$100,000, insured to the amount of \$17,500. But Garratt & Co. are not easily daunted, and they have already started the erection of buildings, and have commenced casting.

The total estimated loss is given as nearly \$262,000. The insurance was very small, as the rates are high for such establishments. In addition, some 200 workmen have been thrown out of employ, which is a very great hardship at the present time. This last is certainly one of the most deplorable results of the fire.

THE SAN JOAQUIN CANAL is being rapidly pushed ahead. Two miles have already been completed. It will be finished to Grayson in season for next year's crop.

## A New Quartz Mill.

We noticed, sometime ago, a new construction of quartz mill, invented by Mr. Jacob Niswander, of Oakland, and patented through the SCIENTIFIC PRESS Patent Agency. This mill has been constructed at the Fulton Foundry, in this city, and shipped to the mines of the Calaveras M. Co. near the Calaveras Big Trees, where it will be practically tested.

The new principle involved in this device is that of making the quartz rock itself do the grinding which has hitherto been done by the contact of iron surfaces, requiring the frequent renewal of the shoes and dies which were rapidly worn away. A stationary mill-stone made of coarse rock cemented together within three or four heavy wrought hoops lying one above another, supplies the lower grinding surface. As this nether stone is gradually worn away, the hoops are removed one after another, till the stone is entirely worn out and needs to be renewed. Through this lower mill-stone passes a heavy vertical shaft, to which is keyed what answers to the upper mill-stone. This is a drum, four feet in diameter and about fourteen inches broad, divided by the arms which connect the hub with the outer circumference or tire into six compartments. These compartments being filled with loose quartz rocks, and the drum revolving at the rate of sixty to one hundred revolutions per minute, it is expected that the loose rocks of the upper stone will be reduced while grinding to a flour-like powder the pea-sized quartz which comes from the stamps. The advantages of this principle of making the quartz grind itself are that it not only saves the expensive wear of the present iron mills, requiring frequent repairs, many tons of iron shoes and dies being worn out every year, but also secures a purer powder, the pulp being free from iron, which now requires to be separated from the gold.

Mr. Niswander is very confident that his mill will work successfully, and in this opinion a number of experienced millmen concur. The objections to it are purely mechanical, and if these can be obviated there will be an extensive call for the machine. We hope to receive detailed accounts of its working, which we shall be ready to publish as of great interest to the mining community.

TRouble at AMADOR.—There has been more trouble, we are sorry to say, at Sutter Creek, and the book-keeper of the Amador mine and a man represented as a rioter, have been shot fatally. Serious apprehensions are felt, but the news has not been definite enough (up to date of going to press) for us to be able to speak authoritatively on the matter. On Wednesday a fire broke out in the Badger shaft of the Amador mine, but it was extinguished without much damage. The latest accounts represent that quiet prevails again.

CHARLES WESTERN.—Our New York correspondent forwards to us the sad news of the death, on July 9th, of Mr. Charles C. Western, long connected with the New York *Engineering and Mining Journal* and the *Manufacturer and Builder*. Mr. Western was of eminent ability and most amiable character, and was highly esteemed and loved by his friends. He lived in this State, at one period, where he acted successively the parts of miner, of draughtsman and, we believe, of editor. He died at the age of 29, when fortune had begun to smile on his efforts.

ALASKA.—Mr. W. H. Dall has arrived in this city, on his way to Alaska in charge of an expedition organized under the auspices of the U. S. Coast Survey. Prof. W. Harrington, of Michigan University, goes as Astronomer. In addition to examining the other features of the country, deep sea soundings will be made, and the agricultural capabilities of the soil will be tested.

## Natural Occurrence of Precious Metals.

We give on another page the results of investigations as to the reduction of certain metals from their solutions by metallic sulphides. These investigations, made by Mr. Skey, analyst to the Geological Survey of New Zealand, are very interesting; and none the less so from the obvious relation they appear to sustain to the manner in which certain of the native metals are frequently associated. We condense Mr. Skey's remarks on this point:

The great deoxidizing power of sulphides generally upon most gold, silver and platinum salts, as shown by the experiments, renders them so absorbent, as it were, of these metals, that any such solutions traversing a thin vein or reef of the mixed metallic sulphides would, probably, be divested of these metals. Solutions of silver, however, would be little affected in traversing veins of iron pyrites or stibnite, unless gold was also present, when probably some of the silver would be precipitated with the gold by a single chemical substitution. On the other hand, silver would be absorbed readily by veins of galena or inferior sulphides. This agrees with what we find in nature, and the facts stated seem to explain very simply why gold and silver occur always or frequently with certain of the metallic sulphides, and never or rarely with others. Whether or no this is the reason of such association, the facts should be kept in view when attempting to explain the origin of deposits. As yet, any generally received theory has been based on the reducing action of organic matter; but the action of the common sulphides is more rapid and powerful—a single grain of iron pyrites being sufficient to reduce 8 1-6th grains of gold. These researches have opened up some singular chemical reactions. It has appeared that aqueous solutions of oxy-salts of gold, among which we must include the chlorides, for obvious reasons, possess a greater oxidizing power than hitherto contemplated. I think it is a little superior to that of chromic acid. Further, these salts oxidize not only the metals of the sulphides, but also the sulphur; although direct experiments show that neither common (sublimed) sulphur nor sulphur precipitated from solution in alkalies is affected at all by them, even when the auriferous solutions are raised to the boiling point. This vulnerability of combined sulphur, as against its invulnerability when free, suggests the 'greatness of the change which sulphur in itself undergoes in passing to a state of combination. Possibly some voltaic action, facilitating this change, may be caused by these several substances among themselves, in which the gold already reduced would form the negative element; but this does not, of course, explain how the oxidation commenced.

NEW DITCHES IN BUTTE.—The *Chico Northern Enterprise* of July 22d, says: We gather the following items concerning the new ditches now in process of construction in our county. The Cherokee Company have a large force at work and are vigorously pushing forward their ditch. They tap Butte Creek near its head waters; and through a ditch in size seven feet at top, four feet in the bottom, and two and a half feet deep, and of capacity to hold 2,000 inches of water; they design to introduce water to Cherokee Flat and intermediate points. They have in employ 150 men, and have already dug seven miles of ditch. They will have it completed by fall to the Nimshew diggings. The surface and hill mines afford good pay, and will the coming winter engage a large number of miners. The work is under the immediate management of Messrs. Gregory, Pullman & Moore, of Cherokee Flat. The Hendrick Brothers have employed about 200 men on their ditch, leading the waters of the west branch of Feather river into their diggings at Morris Ravine, and intermediate points. They have commenced work on the lower end of the line, and have already completed several miles of the work. Their ditch will measure nine feet top, six feet bottom, and two feet deep. These two works are very important ones, and will revolutionize the mining interests of our county.

POSTAL MONEY ORDERS.—We see that an arrangement has been effected, by which an international money order system will go into effect on the 1st of next October between the U. S. and Great Britain. The limit of a single money order is \$50. It is said that the same system will be extended to other European countries.

## Academy of Sciences.

The regular meeting was held on Monday evening, July 17th. The Proceedings of the New Zealand Institute for 1870, the horsers of Alaska, and photographs of the last volume of the Coast Survey on the Har-sea lion and fur seal at Woodward's gardens were presented.

### A Curious Sponge.

Dr. Blake read a paper on the specimens from Burrard's Inlet, B. C., which were stated to be the bones of a fish. They actually belong to the order of *Protozoa*, class *Spongidae* or sponges. The lower portions of the stems are covered with a horny substance formed of a tough sarcode permeated by tubes, the sides of which are furnished with small pores, the whole surrounding a central axis which forms an internal calcified skeleton and which, by its development and elongation, forms the long stem. The arrangement of the sarcode around the axis, at least in the earlier periods of its growth, is not circular, but has in transverse section somewhat the shape of a Maltese cross. The central axis is formed by concentric calcified layers (as many as 13 have been counted) of a tough chitinous substance. In the specimens received, the greatest thickness is about ¼ inch, and the length of some is 90 inches. At each extremity it tapers to a fine point, the top more particularly being surmounted by a long hair-like prolongation of the chitinous substance. The species is possibly new; at least its previous description is unknown to Dr. Blake. Its generic relations, he thought, would be with *Hyalonema* and *Enplectella*, both Pacific Ocean sponges.

### American Association.

Prof. Davidson read letters and made a report of progress with regard to the invitation to the American Association for the Advancement of Science. Half-fares from Omaha would be allowed, and a liberal disposition was evinced on the part of the merchants here. The matter was discussed at length, and the Trustees were requested to consummate the invitation.

Prof. Davidson made a correction in the Proceedings of the Academy for 1870. In Vol. IV. Part 3. p 122, l. 8 from bottom, read *bright* instead of *gray*.

A live "King Snake," *Ptyophis catenifer*, was presented by Dr. Stout, who proposed making a demonstration of its general anatomy for the Academy.

Prof. Smith, M. D., of Sydney, Vice-President of the Royal Society of New South Wales was introduced to the society.

## A New (?) Mineral.

The following letter to us explains itself. In your issue of July 8th, 1871, I read a notice from Battle Mountain concerning an interesting mineral, very similar to malachite, when polished with a handkerchief, found in a copper mine near Battle Mountain. You doubtless noticed its property of adhering strongly to the tongue as if it were chiefly clay. This induced me to suppose that it was an aluminate, but an analysis, which I made several months ago, showed that it is a silicate of copper, containing about 30 per cent. of copper. In appearance it differs so much from the known silicate, that it might be considered, so far as my knowledge goes, a new variety of silicate of copper. I do not remember now the quantitative composition of this mineral; but will hand it over to you immediately on my return. I am very thankful to F. H. for a sample of this ore. G. KUSTEL.

Ellsworth, July 19, 1871.

QUICKSILVER.—A correspondent of the *Call* has visited the Summit Quicksilver mine, 16 miles north-west of Napa City, and 4 miles south-west of St. Helena. There is a tunnel 450 feet long which cuts a body of ore 70 feet thick. A shaft, 145 feet deep, strikes the tunnel about 400 feet in. The mine is owned by the Whitton Brothers. The croppings extend 1,000 feet. A great deal of the ore "will yield 60 and even 70 per cent." So says the writer. We feel perfectly safe in predicting that the last statement will exceed the results attained by several hundred per cent. \* \* \* The *Vallejo Recorder* says that Mr. John Brownlie, of Vallejo, will soon erect kilns for treating the quicksilver ore which exists on his ranch.

### The Penman's Assistant.

We give below an illustration of a device, which, although its usefulness may be doubted by many on first thought, is yet said by numerous experienced teachers to have been proved to be of great use.

The object of the device is to teach the pupil the correct position of the hand and the correct method of writing. It consists essentially of an egg-shaped ball which is held by the third and fourth fingers in the palm of the hand, in a ring for maintaining the proper angle to the pen holder, and in the thumb and finger rest.

Numerous certificates are given as to the value of the device, of the great assistance to children in removing the difficulty of cramped hands and of manifold unsuccessful attempts before any progress in writing is attained. And for older persons also, we have the statement of business men that it is the greatest help, especially for those who have much writing to do.

We have before us now testimonials from the Principals of the well-known Mills' Seminary, of the Principal and Trustees of the Benicia Public School, and of other persons on the coast. These endorse the "assistant" so warmly, that the device must have proved itself of great value to them in teaching others and in writing themselves. Rev. O. P. Fitzger-

ald, State Superintendent of Instruction, endorses it as "one of the best inventions of the day."

Messrs. Moore & Weinmann, (P. O. Box 1915, S. F.) are the general agents for the Assistant on this coast. They are also agents for Eastman's copy hooks, pens, etc. Perhaps the best endorsement needed for them is the great success achieved by Mr. Eastman in his commercial college in Poughkeepsie, N. Y., which is, we believe, one of the largest institutions of the kind in this country.

### Bankart's Roasting Furnace.

There have been collected, at various times, in Austin, Nevada, numbers of men of pre-eminent theoretical as well as practical knowledge. To these men we are indebted for much valuable information of the various resources and conditions of that State, and, to a very great extent, for improvement, in the treatment of ores.

There comes now from Austin a new furnace for roasting "rebellious" silver ores. The inventor is Mr. I. Hubert Bankart. This gentleman claims that his furnace will treat silver ores which hold antimony, lead, zinc or other base metals, in the most satisfactory manner, chloridizing the silver to a very high percentage, treating large quantities in a very short space of time with a small consumption of fuel, and avoiding the heavy loss sustained by the pulverulent matters being carried by the draft through the flues and stack into the atmosphere. The necessary oxidizing and chloridizing action is effected, he says, by the aid of copper fans revolving on a shaft working in a gudgeon, and propelled from the outside of the furnace by a crank connected with the engine, so

that the ore with its complement of salt, dropping from the hopper, first upon one fan, then thrown on to the next, and so on, alternately, will have every particle equally exposed to the action of the flame, and thus the sulphur will be liberated and the silver thoroughly chloridized, before the hearth is finally reached.

The following illustration and description will explain the construction and working of the furnace:

The furnace consists of a circular shaft, *O*, of common brick or stone, lined with fire brick or slate. Over this is placed a closed, self-feeding hopper, *A*, to the bottom of which is secured a circular plate, *D*, of boiler iron or copper, which is slotted in one direction so as to form parallel bars about an inch wide. Above this plate is a revolving plate, *C*, of similar construction, attached to the lower end of a vertical shaft, *B*, which bears in the fixed plate and can be moved at any required speed by means of belting, or other device, at the top.

In the frame work of this hopper, and underneath the fixed plate, is a damper, *S*, which can be closed or opened at will by the workmen drawing the charge. A screw carries the ore from the mixing chamber to the hopper, as denoted by *P*.

BANKART'S FURNACE FOR ROASTING SILVER ORES.

There are three fire-places, *F*, at equal distances from one another around the shaft, about five feet from the bottom, and three others, *F*, similarly arranged, about 30 feet from the top. The latter are supported on hollow iron pillars, *G*. The fans, *E*, are placed alternately, 2½ feet above one another, and project slightly beyond the center of the shaft, to prevent the direct and vertical ascent of the flame.

The fume flue has a lip or apron, *r*, to prevent the descending ore from luting, and conveys any escaping particles of dust through the flame of another grate, *F*, to the entrance of the chambers, where it is met by a revolving cylinder (not shown), from which jets of steam constantly issue with a contrary motion to the current of vapor, in order to throw down any escaping ore. From here the fumes pass under the cylinder into chambers, about 4 feet high, with vertical plates or partitions, *K*, attached alternately to the top and bottom.

At the bottom of the shaft, *A*, there is a discharge hole, *M*. Or, preferably, the hearth is inclined, as denoted by the dotted lines, *Y, Y*, so that the ore falls into chambers, *Z*, into which is admitted steam, or water to cool the ore.

The furnace is said to be capable of thoroughly treating 4 tons per hour, with a consumption in 24 hours of 6 or 7 cords of wood (or its equivalent in coke or charcoal), and to require the attendance of only 2 men every 12 hours. Ores can be treated at an entire cost of \$10 per ton.

Application for patents has been made through the SCIENTIFIC PRESS Patent Agency. Further particulars, plans and estimates will be furnished by Mr. I. Hubert Bankart, Austin, Nevada.

### PETRIFIED FOREST IN SISKIYOU COUNTY.

A correspondent of the Marysville Appeal writes from Camp Bidwell, in the north-east corner of California, under date of June 29, giving some interesting facts. He writes thus of a petrified forest near the head of Cedar Creek Cañon: We reached what appeared to have been a grove, containing many trees of different sizes, all fallen and in a perfect state of petrification, and most of them broken into fragmentary blocks, which were scattered over a space of several acres. One tree, perfect in contour, yet a solid stone, two and a half feet in diameter, was exposed entirely above the ground for several feet at the butt, the top lying down the hill and covered with land and earth. The top of one of these trees, containing many knots, being sixteen inches long and eight inches through, weighing some sixty pounds, was secured. The exposed portion of the large tree was not disturbed, hoping, at some future day, to be able to bring away a large section of it entire. Several stumps were also discovered standing erect, but whether or not roots were attached we could not determine, having nothing but a small hand hatchet to excavate with, and all being deeply set in the ground; besides, the afternoon was now far spent, and we had

CLOUD-BURST IN NEVADA.—Day before yesterday, says the *Ter. Enterprise* of July 22, about 5 o'clock in the afternoon, a cloud-hurst occurred toward the head of El Dorado Cañon, Lyon county, some miles south-east of Dayton, which sent an immense flood of water surging down to the Carson. When the huge volume of water entered the river it split into two streams. One of these moved straight toward the Rock Point dam, which is filled up with a great mass of driftwood, while the other turned aside and made a new channel for the river. The dwelling of David Swartz, on the opposite side of the river from Dayton, was for a time in great danger of being swept away. After the flood subsided, it was found that the lower floors were covered to the depth of a foot with slum. The raging waters brought with them, in addition to a great quantity of such trash as would float upon its surface, a great deal of sand and gravel. Some years ago there was a similar cloud-hurst at the head of El Dorado Cañon, which sent boulders of many tons weight trotting down its rocky bed.

PROSPECTING.—Dr. Yates, of Centerville, started last week with a small party on a prospecting tour, having a three-fold object in view, namely to search for minerals, grizzly bears, and the fossil remains of mastodons, elephants, sea-lions, etc. The party will proceed among the Panocho range of mountains, some fifty miles to the south-east of Gilroy. The Doctor has received information that fossil remains of the mastodon and elephant have been found in and near the little valley of Saucelito, and so strong is his passion for such antediluvian relics that not even the knowledge that the vicinity is the rendezvous for some of the most blood-thirsty outlaws on the Pacific Coast is sufficient to deter him from its gratification. The party will go thoroughly provided with all the requisite equipage for camping out and roughing it among the mountains, and for protection and defense against handitti and grizzlies.—*Alameda Gazette* of July 20th.

NORTHERN PACIFIC R. R.—The roads leading to the Red River Valley are literally covered with emigrant wagons, with their usual accompaniments of families, furniture and stock of all kinds. The wagon roads from Sauk Center to St. Peter show daily accessions to the vast caravan wending its way to the fertile regions of Northern Minnesota. The extent of the great incoming tide of humanity can be best estimated on the main road between Alexandria and Pomme de Terre. Two hundred wagons per day pass over this portion of the route northwest, and the camp fires are seldom allowed to go out. A fresh train of emigrants arrives almost as soon as its predecessor has resumed its march.—*St. Paul Pioneer*.

FRUIT DISTILLING.—A Washington telegram, of July 21st, says that E. S. Holmes, the clerk in charge of the section of distillation in the Internal Revenue Bureau, starts for California to-night for the purpose of investigating the manner of fruit distillation in that State. Complaints have recently been made by the vintners of California that the regulations of the Internal Revenue office in relation to that branch of distillation is not applicable to the manner in which it is carried on in that State.

RAMIE.—We yesterday took a look at the Ramie patch of Messrs. Meek & Finch, on Mr. Meek's place near the San Lorenzo creek, and found the plants in a very healthy and thrifty state. Although the plants were set far apart, (six feet we believe,) the ground is well covered with the growth, and some of the plants are five feet in height. These plants were set out last year and from them were taken the plants which were set out on the Hill place, which have not done so well, owing to mismanagement in their planting and cultivation, as Finch informs us. Those competent to judge say that Ramie will be a profitable crop here, when it is properly planted and cultivated.—*Alameda County Advocate*.

A PIONEER ENGINEER.—A New York telegram, of July 25, says: Charles Dyke, engineer on Robert Fulton's first steamer to Albany, died yesterday, aged 85 years. Mr. Dyke also engineered the first steamer down the Ohio and Mississippi rivers to New Orleans.

WATER SPOUT IN NEVADA.—On the evening of July 20, a water spout injured the track of the C. P. R. R. at Granite Point, 18 miles west of Oreana.

COAL.—A new coal bank is reported as discovered near Oysterville, on Yaquina Bay, Oregon.

## DOMESTIC ECONOMY.

### To Clean Marble.

Marble mantles, hearths, table tops, etc., are easily discolored by coal gas, pitchy smoke from pine kindlings, fender rust, grease, ink, etc.; and it is surprising how often, otherwise careful housekeepers will neglect such discoloration, until it is too late to remove it, when it becomes a permanent and unseemly disfiguration. Generally such discolorations, if taken in hand at once, may be removed by a little hot soap and water applied with a plenty of elbow-grease. For ink and other stains a little diluted sulphuric acid may be rubbed on with a cloth, and removed with clean water as soon as the stains disappear. Discoloration from coal smoke may be removed in the same manner; but the application should be made as soon as noticed, or the stains will so penetrate the marble, that any attempt to remove it with acid will so disfigure the marble as to deface it worse than the stain. If the discoloration has penetrated to any considerable depth, the only way is to cover it up, which may be done by the application of a thin stucco made of fine marble-dust. This application gives the marble a pure white coating, without any gloss. The gloss may be secured by varnishing the stucco with a solution of soda or water-glass. This last application forms a very good looking and durable covering and may be also used for renovating old or neglected statuettes, etc.

A WOODEN KITCHEN OR DAIRY FLOOR, or a floor for any other room which you do not wish to carpet, but which it is desirable to keep scrupulously clean, may be prepared with as good a surface or polish as marble, by simply coating it with several applications of water-glass. The cracks and crevices should first be filled up, even with the floor surface, by a putty made of water-glass and gypsum. Four coats of the water-glass will form a hard durable coat, not affected by heat, and but little liable to wear. It will moreover look as bright and handsome as marble, and may be even more easily kept clean. If color is desired, it may be added, in the form of mineral paint, to the last application. A floor prepared in this manner will last six or eight years, and the cost is very small, as the silicate of soda, from which the water-glass is made, is very cheap.

### Tomato Beer.

A Georgia correspondent of the *Southern Planter* tells how to make tomato beer. He says: "Gather the fruit once a week, stem, wash and mash it; strain through a coarse linen bag, and to every gallon of the juice add a pound of good, moist brown sugar.—Let it stand nine days, and then pour it off from the pulp, which will settle in the bottom of the jar. Bottle it closely, and the longer you keep it the better it is when you want to use it. Take a pitcher that will hold as much as you want to use—for my family I use a gallon pitcher—fill it nearly full of fresh sweetened water, add some of the preparation already described, and a few drops of essence of lemon, and you will find it equal to the best lemonade, costing almost nothing. To every gallon of sweetened water I add a half tumbler of beer."

A REFRESHING BEVERAGE.—Dr. Waller Lewis, in describing the precautions against cholera adopted at the General Post Office, in London, Eng., says: "The men employed in sorting letters and newspapers suffer much from thirst, especially in the hot weather, and consequently drink much water while engaged in their duties. Although the Post Office is supplied with excellent water, much diarrhoea was, nevertheless, the result of this practice. To remedy this the officers, clerks and men of all classes have of late been supplied from the medical department with a most agreeable drink, which not only assuages the thirst, but has, moreover, strong antiseptic and anti-diarrhoea properties. It is called orangeade, and is thus composed: Take of dilute sulphuric acid, concen-

trated infusion of orange peel, each twelve drachms; syrup of orange peel, five fluid ounces. This quantity is added to two imperial gallons of water. A large wine-glassful is taken for a draught, mixed with more or less water, according to taste. The officers drank this with pleasure. It is being consumed in large quantities daily, and I am convinced it will be the means of warding off a great deal of sickness."

### How to Green Cucumbers.

There is no way to impart a green color to cucumbers, that would not be injurious to health, except by the use of green leaves, like those from the grape-vine. Possibly sap green, which is a preparation from the juice of huck-thorn berries, would answer the purpose if it could be obtained here. Verdigris can be detected in nearly all the pickles of commerce; but its use is highly objectionable, as it is a poisonous acetate of copper. Pickles may be colored with it if the people place a higher regard on the color of the condiment they eat than on their health. Nearly all the shades of green are produced from some combination of arsenic, but this fact does not prevent the use of them for coloring confectionery. Cannot some one introduce a new fashion in the color of pickles?

NUTS AND CHEESE promote digestion as a general rule; the conditions being that the nuts should be ripe and the cheese old, both to be eaten at the close of dinner; the digestive agent in both is a peculiar oil which has the property of acting chemically on what has been eaten, and thus preparing it for being the more easily appropriated to the purpose of nutrition. Many think that the more solid portions of the nut should not be swallowed. This is an error; those particles of solid matter are not digested, it is true, but they are passed through the system unchanged, and act as a mechanical stimulant to the action of the internal organs, as white mustard-seed swallowed whole are known to do, thus preventing that constipated condition of the system which is so invariably productive of numerous bodily discomforts and dangerous and even fatal forms of disease.

PATCHWORK AND MENTAL CULTIVATION.—We heartily endorse the following from a correspondent of *Hearth and Home*: Farmers' wives have little enough spare time at the most, and any woman who desires to have an intelligent and well informed mind will prefer to spend her leisure hours in trying to get wisdom, instead of wasting them in making patchwork quilts, especially as a clean white spread for the outside covering of a bed, looks nicer, and is in better taste, than all the patchwork quilts in existence.

It is no doubt a good plan for little girls to busy themselves piecing calicoes, but there are very many who have no little girls, and to all such I say, improve your time in reading good books and papers, and cultivating your intellect instead of making "patchwork quilts."

TO WASH WHITE WOOLENS.—Put a kettle of clear soft water on the stove and shave enough soap into it to make a strong suds; let it come to a boil, and pour it over the flannels placed in a tub; let them stand until they are cool enough to handle, and then rub or squeeze slightly and wring out. If they were very dirty, repeat the operation; if not, make a very weak suds, boiling hot, and after it is taken off the fire put in some blueing and proceed as before; then shake well, and bang up to dry. You will find the flannels will not full up and get too small, but will be as soft as when new.

HOW TO KEEP MEAT FRESH.—As farmers are at a distance from meat markets, the following directions for keeping meat may be of use to those that try it: Cut the meat in slices ready to fry. Pack it in a jar in layers, sprinkling with salt and pepper, just enough to make it palatable. Place on the top a thick paper or cloth, with salt half an inch thick. Keep this on all the while. I have kept meat for three weeks in the summer, and the last was as good as the first.—*Rural American*.

TO TAKE GREASE OUT OF CARPETS.—Cover the spots with whiting and let it remain until it becomes saturated with the grease; then scrape it off and cover it with another coat of whiting, and if this does not remove the grease, repeat the application. Three coats of whiting will, in most cases, remove the grease, when it should be brushed off with a clothes brush. So says one who pretends to know.

### Domestic Receipts.

LEMON PIE.—One lemon, one cup of sugar, two eggs, three table-spoonfuls of flour, one cup of milk; grate the rind of the lemon; mix the whole together, leaving out the whites of the eggs; pour in the milk last. Bake in a deep plate lined with pastry. Beat the whites of the eggs to a stiff froth; sweeten with four table-spoonfuls of sugar; put it on the top when baked, and return the pies to the oven and brown lightly.

GINGER STR CAKE.—Three eggs, 1 cup of lard, 3 do molasses, 4 do flour, 2 tea-spoons of saleratus,  $\frac{1}{2}$  cup of cold coffee, 1 tablespoon of ginger.

TO TEST SOAP.—The readiest way to find whether soap will injure the delicate skin of women and children is to test it with the tongue. Good soap, in which the caustic alkali is neutralized by thorough combination with the fat, will not have a sharp taste. The soap used in medicine, and the transparent soaps, are neutral and good. Many toilet soaps, and especially the imitation marbled castile soap, so abundant in the trade, contain too much free alkali. They have not been thoroughly hoiled, and are very sharp. Do not use them upon delicate skins.

ELDER OINTMENT.—Take a double handful of dried elder flowers separated from the stems, and boil them in one quart of water, until it is reduced to half a pint; then strain it, and add to this strong elder tea, two large spoonfuls of melted lard (fresh), two large spoonfuls of melted mutton tallow, and simmer it until the water is all evaporated. This makes an excellent healing ointment.

A BLACKING PASTE FOR BOOTS.—The *Manufacturer & Builder* says:—A good paste for blacking boots is made from twenty parts tincture boneblack, twenty parts syrup, three parts castor oil, one part sulphuric acid, well mixed. A cheaper prescription is ten parts minced potatoes treated with one part strong sulphuric acid, till the whole mass is a lustrous black, then add four parts of boneblack and two parts of any fat, lard or oil.

TO MAKE GROUND PEA CANDY.—Pare, shell, and beat the peas. Take up the candy before it has boiled as much as in the first receipt, and use more butter; stir while boiling. When poured out, mix in the peas. Almonds and grated cocoanut may be used.

### Mechanical Hints.

LUBRICATORS.—Tallow is the best lubricator for wood axletrees, and castor oil for iron. Just enough grease should be applied to the spindle of a wagon to give it a light coating.

RAT AND MICE PROOF HOUSE.—James M. Hartwell, of Colesbrook, N. Y., gives a plan, which he says has proved fully successful.

After the frame of the building is up and boarded, and the partitions for the rooms are made, take some mortar and bricks and lay one or two thicknesses of brick between the lower and upper floors. Then lath and plaster to the floors and put on a narrow mop or washboard, not so high as to have the upper edge come above the bricks, as the rats and mice gnaw in just over or just under the washboards.

THE LARGEST PLANING MILL.—Burlington, Vt., has the largest planing mill in the world. The lumber yard, docks, sheds, mills, etc., of the firm cover an area of nearly fifty acres, and in this area there are about seven miles of plank road. To carry on this establishment from 400 to 500 men and boys are employed.

IMPROVED PASTE FOR WALL.—A new form of paste for attaching paper bangings to walls, and one which, besides possessing the merit of cheapness has the advantage of preventing the paper from separating or peeling off, is prepared by first softening 18 pounds of finely powdered bole (fatty clay) in water, and then draining off the surplus water from the mass. One and a quarter pounds of glue are next to be boiled into glue water, and the bole and two pounds of gypsum are then stirred in, and the whole mass forced through a sieve by means of a brush. This is afterward diluted with water to the condition of a thin paste or dressing, when it is ready for use. This paste is not only much cheaper than the ordinary floor paste, but it has the advantage of adhering better to whitewashed surfaces, especially to walls that have been coated over several times, and from which the coating has not been carefully removed. In some cases it is advisable, when putting fine paper on old walls, to coat them by means of this paste with a ground paper, and to apply the paper hanging itself to this with the ordinary paste.

## LIFE THOUGHTS.

TENDERNESS, says a sentimental philosopher, is passion in repose.

DESIRE is a tree in leaf, hope is a tree in flower, and enjoyment is a tree in fruit.

WHAT a pity that common sense, for want of use, should have become uncouth.

EXTERIOR beauty is a recommendation written with such pale ink, that time effaces it.

It often happens that they are the best people whose characters have been most injured by slander, as we often find that to be the sweetest fruit which the birds have been pecking at.

SOME people are afraid of anything like joy in religion. They have none of themselves, and they do not love to see it in others. Their religion is something like the stars—very high, and very clear, but very cold.

### Golden Words for the Young.

Peter Cooper, of New York, now eighty years old, and one of the most successful business men in the country, is, as is well known, the founder of the great Institution in New York which bears his name. On the occasion of a recent gathering there of the young men who have enjoyed the advantages of his noble generosity, Mr. Cooper made the following address, every line of which is made up of golden words, which should be read and pondered by every young man in the country:

While yet a child, I learned that the "hand of the diligent maketh rich," and whatever of wealth I have achieved, has been due primarily to habits of patient industry formed at the outset of my career. I soon learned that "waste makes want," and I therefore saved what I earned; and, by taking "stitches in time," guarded against the loss which unavoidably attends upon neglect and want of foresight. It did not take long for me to learn that drunkenness was the parent of the larger portion of the poverty, vice and crime which afflict the American people; and hence, until advancing age seemed to demand moderate stimulants, I carefully avoided alcoholic liquors as the greatest curse of the young, and the most deadly foe to domestic happiness and the public welfare.

Next, I observed that most of the shipwrecks in life were due to debts hastily contracted, and out of proportion to the means of the debtor; hence I always avoided debt, and endeavored to keep some ready money on hand, to avail of a favorable opportunity for its profitable use. With economy and industry it is easy to do this in this favored land, and in my case the result has been that, amid all the financial revulsions through which I have passed, no obligation of mine has ever been a day in arrear. Debt is a slavery which every young man ought to avoid, or if assumed, ought not to endure for one day beyond the shortest time necessary to set him free. Shunning intemperance and debt, and practicing industry, rigid economy and self-denial, it was easy to be honest, and to acquire such knowledge as the opportunities of this city offered in the days of my youth.

I was cheered, comforted, sustained and encouraged by the greatest of human blessings, a diligent, wise, industrious, faithful and affectionate wife, aided by the earnest sympathy and active coöperation of my children, who justly regarded as the richest portion of their inheritance, that portion of my wealth which I desired to consecrate to the public welfare. Hence my last lesson for the young is to marry at the proper age, when, and not before, they can see their way to a decent and comfortable support, and thus fulfill the first law of nature with a high and holy sense of its bappiness, and its duties, the greatest and most serious in the path of life. Love and duty I have ever found to be the "passwords" of all that is true and noble in life, and when they are separated, the fires on the family altar die out, and life loses all its charms, never to be compensated by the false jewels which are often worn in the public gaze.

Reform, to be of any permanent value, must be based upon personal virtue, not force; and it seems to me that the millennium will not be far off when each individual shall set about reforming himself, rather than society, and conforming his life to the great law of loving God and his fellow men.

PETER COOPER.

## Guide and Catalogue of the Fair.

We see that Mr. Jacob Price is at work collating material and soliciting advertisements for his Visitors' Guide and Catalogue of the Mechanics' Fair. This work is to be published under the supervision of the Board of Managers.

The idea is a good one, and we hope that liberal support will be given. The work will contain a description of every article on exhibition, and will be furnished to visitors at as low a rate as possible, not exceeding fifty cents per copy—probably not more than twenty-five cents; copies will also be rented at some very low figure by the day to such persons as will not purchase otherwise, it being the object of the publishers to dispose of them at the very lowest paying rate. The work will be published in installments for the first three or four days of the Fair, and will be kept up as close as possible to the arrival of goods each day. It will be issued in complete form about the sixth or seventh day of the Fair.

According to the official report of the last exhibition, eighty thousand visitors were present. The coming fair will be on a much larger scale than ever before, and will be visited by a much larger number of persons. People are finding out that the trouble caused them in furnishing articles for exhibition is amply repaid by the attention called to their exhibits, so that exhibiting is an exceedingly good financial speculation. In the same way, the opportunities afforded to the advertiser by the proper means at such fairs, are very favorable in a pecuniary point of view.

We have spoken of such a work as a good medium for advertisers. But a properly arranged guide and catalogue is a benefit to others. The Fair gains by it, in that the collection of exhibits is given in good form and the descriptions are sent far and wide. The exhibitors gain in the attention attracted to their articles. The visitors are also the gainers by the convenience of having the whole exhibition presented to them, as it were, on a small scale, so that they know what there is present, and where it is; and when they see anything which interests them, they can know all about it with infinitely less trouble than if they, in common with many others, must be continually asking questions.

For many such reasons, we recommend the guide to advertisers, exhibitors and visitors. Being under the supervision of the Board of Managers, we believe that the work will be carried out well. And we speak also a kind reception of the solicitors, who, as far as we have seen, are an exceedingly gentlemanly set of fellows. Mr. Price, by the way, has his office at Baker & Hamilton's, 17 Front street.

**A DESERTED NEVADA VILLAGE.**—The *Eureka Sentinel* tells of a genuine "deserted village" in Danville mining district, some 60 miles south of Eureka. Five or six years ago the village was quite lively, and now "a death-like stillness reigns; not even is this painful quietness relieved by the hooting of an owl or the quack of a buzzard. The doors of the twelve unoccupied log cabins swing listless to and fro at the bidding of the fitful winds. The grass in the deserted streets is now waist high, with no living soul to trample or recuperate upon its fattening virtues. There is a fine stream of water running through the town, and plenty of wood immediately surrounding this depopulated camp." Some one informs the *Sentinel* that he found ore that would mill \$100 per ton.

**LECTURES.**—Mr. B. F. Underwood, who by his writings and lectures has won a large number of friends, will lecture, Saturday and Sunday evenings, before the Mechanic's Institute or Christianity and Free Thought on Naturalism vs. Supernaturalism; and on Sunday morning, at Dashaway Hall, on the Influence of Christianity on Civilization.

**UNDAUNTED ENTERPRISE.**—W. T. Garratt & Co., whose brass foundry was destroyed by fire Saturday afternoon, have bought out the establishment of Wm. H. Moore, on Beal street, taking all his stock, tools and machinery. They will proceed at once to erect new and permanent buildings.

## New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

**PIGEON POINT WOOD AND LUMBER CANAL CO.** San Mateo county.—July 14. Capital stock, \$20,000 in 200 shares. Trustees: L. Colburn, T. H. Hatch and W. B. Carr.

**CLOVERDALE JUNCTION WOOD AND LUMBER CANAL CO.** San Mateo county.—July 17. Capital stock, \$20,000 in 200 shares. Trustees: L. Colburn, T. H. Hatch and W. A. Stewart.

**TIGER S. M. CO.** Yavapai Co., Arizona.—July 19. Capital stock, \$2,400,000 in 2,400 shares. Trustees: W. M. Lent, J. F. Boyd, J. W. Gashweiler, E. J. Cook and G. W. Bowers.

**MAGNET M. CO.**—July 26. Capital stock, \$1,000,000 in 10,000 shares. Trustees: A. J. Moulder, W. H. Raymond and H. Raymond.

**SUNBEAM G. & S. M. CO.** Utah.—July 26. Capital stock, \$220,000 in 2,200 shares. Trustees: E. M. Hall, J. T. Babcock, W. E. Miller, J. Regensburger and H. Palmer.

The following have been recorded in the Secretary of State's office, Sacramento.

**SAN PABLO AND TULARE R. R. CO.**—July 19. Capital stock, \$3,700,000. Directors: L. Stanford, C. P. Huntington, M. Hopkins, E. H. Miller Jr. and C. H. Cummings.

**NORTHERN R. R. CO.**—July 19. Object, to build an air-line railroad from S. F. to Tehama county. Capital stock, \$8,400,000. Directors: L. Stanford, C. P. Huntington, M. Hopkins, E. H. Miller Jr. and C. H. Cummings.

## Meetings and Elections, Etc.

**OVERMAN M. CO.**—July 13. Trustees: M. J. McDonald, J. A. Pritchard, O. H. Bogart, L. Vessari and E. T. Rann.

**MAHOGANY G. & S. M. CO.**—July 17. Capital stock increased from \$602,000 to \$1,000,000 divided into 10,000 shares.

**SOUTH CHARLOT M. CO.**—July 19. Trustees: C. E. McLane (President), Hill Beachey (Vice-President), M. Livingston (Treasurer). Superintendent, J. F. Cassell; Secretary, J. L. King.

**SEATTLE COAL AND TRANSPORTATION CO.**—Trustees: P. Donahue, I. Bluxome, M. W. Allen, H. L. Hutchinson and W. B. Cummings.

**TECUMSEH G. S. & C. M. CO.**—Trustees: J. T. Helmken, J. Greif, F. Schumacher, J. Hahn and J. F. G. Eggers. Secretary, J. Hermann.

**LIVERPOOL COPPER MARKET.**—According to Lewis & Son's Copper Report of July, the Liverpool copper market has been firm and active with large sales during the preceding month. Sales of bars on hand and to arrive amounted to 5,800 tons at \$323.75 up to \$340. The last quotations for ore were \$3.43 to \$4; quicksilver, \$47.50 per flask of 75 lbs.; antimony, French Strai, \$245 to \$250 per ton; tin, \$660 for Straits and \$600 for Peruvian.

**WATER PIPE.**—The *Alta* states that at Rawlins, Wyoming Territory, 20,000 feet of water pipe are in use, made of wood (fir) with a 4-inch bore and sides 3 inches thick, bound with iron bands, 1 inch wide and a sixteenth of an inch thick.

## A Good Binder for \$1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for \$1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Sent postage free. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms.

WOOLLAND, July 14, 1871.

DEWEY & Co.—Gents: I received the patent paper on my improved wagon all right, and I return thanks for the promptness with which you pushed it through.

Respectfully, C. ELLIOTT.

**Complete Volumes of the Scientific Press** from January, 1864, can be had at this office at \$3 per volume. Bound in cloth, \$5. A limited number only on hand.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations in the city, or in the country near San Francisco. To be seen at this office.

**EVERY MECHANIC** should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

**MARAVILLA COCOA.**—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. 1c25-ly

**"A SLIGHT COLD," COUGHS.**—FEW ARE AWARE OF THE importance of checking a cough or "SLIGHT COLD" in its first stage; that which in the beginning would yield to a mild remedy, if neglected, often attacks the lungs. "Brown's Bronchial Troches" give sure and almost immediate relief. "The Troches" have proved their efficacy by a test of many years, and have received testimonials from eminent men who have used them.

**TO THE MINING INTEREST.**—Believing that they can thereby aid the mining interest, the managers of the Eighth Industrial Exhibition of the Mechanic's Institute request contributions of ores, minerals and metals from the mines, mills and furnaces of the coast. Such contributions will be given a prominent place, and will be labelled, with details furnished of the condition, etc., of the works from which they come. The collection, if a full one, will attract attention and CAPITAL TO OUR MINES. Wells, Fargo & Co., will forward, free of charge, all such packages, to be sent before August 5th, addressed to Mechanic's Institute, care J. H. Gilmore, San Francisco.

"I CAN'T SEE IT!" say many. But if you really wish to see with a good strong sight you should go to the store of C. MULLER, No. 205 Montgomery street, and look through his glasses.

We have been pleased to meet Wm. H. Murray, Esq., traveling agent of that most valuable mining journal, the *SCIENTIFIC PRESS*, of San Francisco.

He was here some four or five days, visiting our mines and mills, gathering items regarding our resources, and soliciting for the journal which he represents. The *Press*, as a scientific and mining paper combined, is without an equal in America, and we are pleased to know that hereafter it will have a goodly number of readers in this mining camp.—*Colorado Miner, Georgetown.*

## Scientific and Practical

## BOOKS

—ON—

## MINING, METALLURGY, ETC.

BY GUIDO KUSTEL

MINING ENGINEER AND METALLURGIST.

Published and Sold by

DEWEY & CO.

**Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-silver.** 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price \$2.50 coin, or \$3 currency, postage free.]

**Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.** 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid.

**Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores.** 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, \$5 in cloth; \$6 in leather—coin.

For single copies of the above works, or for the trade, address

DEWEY & CO.,

Publishers and Patent Agents, Scientific Press Office San Francisco.

## DANA BICKFORD'S

NEW IMPROVED FAMILY

## KNITTING MACHINE.

**\$1,000 TO \$5,000 A YEAR, AGENTS** can make in almost any section of the country, selling Dana Bickford's new and improved FAMILY KNITTER. This Machine is guaranteed (in its present completeness) to meet every want of the household for either domestic or fancy work. Price \$25. Send stamped envelope with full directions for an illustrated book. Address DANA BICKFORD, Vice-President and General Agent, 689 Broadway, N. Y. 5v23-67bp

## PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature. The timber used is placed so directly in the line of strain, that less material is required to support the same load. It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN. Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

F. MALOON, Secretary.

W. H. GORRILL, President.

## Mining and Other Companies.

On July 29, 1871, the following companies have been organized, and the names of the shareholders are given, which is the very latest hour we can receive advertisements.

## Eagle Quicksilver Mining Company—Lo-

cation of works, Santa Barbara County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of June, 1871, an assessment of twenty dollars per share was levied upon the shares of said Company, payable immediately in gold coin of the United States, to the Secretary, at his office, Room No. 5, No. 302 Montgomery street, San Francisco, California.

Any share upon which said assessment shall remain unpaid on Wednesday, the 9th day of August, 1871, shall be deemed delinquent, and will be duly advertised August 12th, 1871, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 14th day of August, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. H. WATSON, Secretary.

Office, Room 5, No. 302 Montgomery street, San Francisco, California.

## Highland Silver Mining Company—Lo-

cation of works, Railroad District, Elko County, State of Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 13th day of July, 1871, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately, in United States coin, to the Secretary, at No. 24 Merchants' Exchange, San Francisco. Any stock upon which said assessment shall remain unpaid on Monday, the 21st day of August, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 11th day of September, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, No. 24 Merchants' Exchange, California street, San Francisco, Cal.

July 29-td

And in accordance with law, and an order of the Board of Trustees, made on the 8th day of June, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on the 8th day of August, 1871, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.

Office, 206 Front street, San Francisco, Cal.

Advertising charges, \$2 each certificate. July 29-2w

## Nevada Land and Mining Company—Lo-

cation of works, Steptoe, Johnson and Latham, Antelope and Clifton Districts, Elko County, State of Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of July, 1871, an assessment of four (4) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room 5, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Tuesday, the 29th day of August, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 30th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. H. WATSON, Secretary.

Office, Room 5, No. 302 Montgomery street, San Francisco, California.

July 29-2w

## Office Allegany Consolidated Gold Min-

ing Company, Sierra County, California. Notice—The annual meeting of stockholders of the above named company, for the purpose of electing Trustees and transacting any necessary business, will be held at the office of the company, No. 37 New Merchants' Exchange (third floor), California street, San Francisco, on Monday, the 31st day of July, 1871, at 3 o'clock P. M.

J. M. BUFFINGTON, Secretary.

July 29-2w

## KNOWLES' PATENT STEAM PUMP.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.

The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.

The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

## CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,

SACRAMENTO, CAL., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.

Yours truly,

A. J. STEVENS, General Master Mechanic.

## OFFICE OF PEOPLE'S TRANSPORTATION CO.,

PORTLAND, OREGON, April 22, 1871.

Mr. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.

Yours respectfully,

G. MARSHALL, Chief Engineer.

## OFFICE OF N. Y. CENTRAL R. R., ALBANY, June 3, 1871.

MESSEURS. KNOWLES & SIBLEY, New York—Gents: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.

Yours very truly,

C. P. HARM.

## OFFICE OF DELAMATER IRON WORKS, NEW YORK, May 26, 1871.

MESSEURS. KNOWLES & SIBLEY, 92 Liberty street—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.

Yours very truly

GEORGE M. REYNOLDS, Supt. Engineer.

## U. S. NAVY YARD, NEW YORK, June 3, 1871.

MESSEURS. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully,

WM. W. WOOD.

## OFFICE OF THOMAS IRON WORKS, HOKENDAGUA, Pa., June 1, 1871.

MESSEURS. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which to say the least are equal to the best we have tried. I cheerfully recommend "The Knowles Pump" to any who may have use for a first-rate Steam Pump.

Respectfully yours, etc.,

EDWIN MICKLEY, Supt. of Mines.

## OFFICE OF THE SAUCON IRON CO.,

HELLFROSTOWN, Northampton County, Pa., May 26, 1871.

MESSEURS. KNOWLES & SIBLEY, New York—Gents: We saw most cheerfully respond to your inquiry as to the quality of the Knowles Patent Steam Pumps we have in use. We have bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given VERY GREAT satisfaction, and that we like them better than any we have ever used.

Yours very respectfully,

G. W. WHITAKER, President and Superintendent.

## OFFICE OF NEW HAVEN WATER CO., Dec. 18, 1869.

MESSEURS. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyls., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.

Yours very truly,

P. SAULT, Superintendent.

## CENTRAL AND WESTERN PACIFIC AND CAL. AND OREGON RAILROADS,

OFFICE Supt. W. M. P. &amp; M., SACRAMENTO, CAL., July 8, 1870.

A. L. FISH, Esq., San Francisco—Dear Sir: Your favor of the 2d inst. is received, asking my opinion in regard to the Knowles Steam Pump, and would say I have used the Knowles Steam Pump for several years, and consider them for all purposes the best steam pump in use. Yours truly, E. F. PERKINS, Supt. M. P. & M.

Yours truly,

JOHN CLEMENTS, Engineer.

## OFFICE OF RED BLUFF WATER WORKS, RED BLUFF, June 11, 1871.

A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working very four months, and has given entire satisfaction; and I take great pleasure in recommending them to all you have claimed for them, and I will add that I think they have no equal. Yours, etc.,

Yours truly,

JOHN CLEMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machiues on hand.

24v22-cow

## Pinto Mining Company, Location of Works,

Silverado, Pinto Mining District, White Pine County, Nevada.

Notice—There are delinquent upon the following described stock, on account of assessment levied May 24th, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
Leopold Jacobl.....	1	60	\$ 7 50
Leopold Jacobl.....	from 2 to 32	50	193 75

Erasmus Olson.....	212	10,000	1,250 00
D B Arrowsmith.....	not issued	1,610	201 25

And in accordance with law, and an order of the Board of Trustees, made on the 24th day of May, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the 17th day of July, 1871, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

D. B. ARROWSMITH, Secretary.

Office, 426 Montgomery street, San Francisco. 26v22-3t

## PINTO MINING COMPANY.—The above sale is

postponed until Wednesday, the 16th day of August, 1871, at the same time and place. By order of the Board of Trustees.

D. B. ARROWSMITH, Secretary.

## Taylor Mill and Mining Company—Lo-

cation of works, Georgetown District, El Dorado County, State of California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of July, 1871, an assessment of ten (10) cents per share was levied upon each and every share of the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 529 Montgomery street, San Francisco, Cal. Any stock upon which any assessment shall remain unpaid on the 8th day of August, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 4th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

SAML S. MURPHY, Secretary.

Office, 529 Montgomery street, over Sather &amp; Co's Bank, San Francisco, Cal.

July 13-td

## GEORGE T. PRACY,

MACHINE WORKS,

109 and 111 Mission Street,

SAN FRANCISCO.

These Works have lately been increased, by additional Tools, and we are now able to turn out any kind of work, equal to and cheaper than any establishment in the State; that is to say—

STEAM ENGINES,

Flour and Saw Mills,

QUARTZ MACHINERY,

Printing Presses,

AND MACHINERY MADE OF EVERY DESCRIPTION.

Improved Safety Store Hoists,

Fitted with Cutting's Patent Cams, unequalled for safety, convenience and cheapness. This Hoist can be built for about half the price of any other in use. To be seen at HAWLEY &amp; CO'S.

ALSO, MANUFACTURER AND SOLE AGENT FOR

Pracy's Celebrated Governor.

TURNING LATHES, Etc., constantly on hand.

SAN FRANCISCO.

ALL KINDS of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Belts and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE. J. H. WEED V. KINGWELL.

## THE PATENT Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to R. STONE, 422 Battery street, San Francisco. 25v22-3m

## WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

## THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

## IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

## RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

## DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation. For further particulars address

FURMAN R. WILSON,  
San Francisco.

## STEAM JET PUMP.

Blaislee &amp; Williams' Patent.—For Water, Oils, Acids, Etc.

The best COLD WATER PUMP for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit:—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

## Satisfaction guaranteed or the money refunded.

Send for Circular. PARKER &amp; HUNT, Southeast cor. Tenth &amp; K Streets, Sacramento City Cal. AGENTS—CHAS. F. BUCK, 117 California st., San Francisco; KEEF &amp; BARGION, Stockton. Can be seen at McAFFEE, SPIERS &amp; Co's. Boiler Works, S. F. 21v21-tf

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

Platinum Scrap and Ore purchased. 22v18t

## Varney's Patent Amalgamator.

## These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottom, as desired.

## This Amalgamator Operates as Follows.

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 329 Fremont Street, San Francisco.

## The Stetefeldt Furnace.

## Miscellaneous.

The "PAIN KILLER" may justly be styled the great medicine of the world, for there is no region of the globe into which it has not found its way, and been largely used and highly prized. Moreover, there is no clime to which it has not proved to be well adapted for the cure of a considerable variety of diseases; it is a speedy and safe remedy for burns, scalds, cuts, bruises, wounds, and various other injuries, as well as for dysentery, diarrhea, and bowel complaints generally. It is admirably suited for every race of men on the face of the globe.

It is a very significant fact, that notwithstanding the long period of years that the "Pain Killer" has been before the world, it has never lost one whit of its popularity. But on the contrary, the call for it has steadily increased from its first discovery, and at no previous time has the demand for it been so great, or the quantity made been so large, as it is to-day.

Another significant fact is, that nowhere has the Pain Killer or been in higher repute, or been more generally used by families and individuals, than it has been here at home, where it was first discovered and introduced. That the Pain Killer will continue to be, what we have styled it, THE GREAT MEDICINE OF THE WORLD, there cannot be the shadow of a doubt.—Providence Advertiser.

Substantial Success Based on Merit.

THE

## IRON WORLD AND MANUFACTURER

IS PUBLISHED WEEKLY AT

Pittsburgh, Pa.,

AND IS THE LEADING—IF NOT THE ONLY—REPRESENTATIVE JOURNAL OF THE METAL

TRADES PUBLISHED IN THE  
UNITED STATES.

Located in the very centre of the metal interests of the United States, with offices and correspondents at the leading cities in the East, West and South, we do not err in claiming that it is the REPRESENTATIVE JOURNAL of the Metal Manufacturers, Workers and Dealers of this country.

THE IRON WORLD AND MANUFACTURER has a large and extended circulation throughout the United States, and is taken by Iron and Steel Manufacturers, Machinists, Founders, Hardware Dealers and Timbers, Gunsmiths, Plumbers, Cutlery Manufacturers, File Manufacturers, Saw Manufacturers, Boiler Manufacturers, and by

## Leading Railway Officials.

It advocates protection to American Manufacturers. Its markets are full and reliable. If you are a manufacturer, take the journal that advocates your interests. Don't patronize Free Trade journals, but help those who help you.

With Free Trade the manufacturers of this country would be ruined. English gold is scattered with a liberal hand to further Free Trade. Expend some of yours to favor Protection.

If you advertise, which is the best medium? Circulation being equal, which would you patronize—a Free Trade journal or a Protection journal? Circulation is considered the value of an advertising medium. Much depends on the character of the circulation; The New York Weekly Tribune claims 200,000 circulation, and gets from two to five dollars per line for advertising. The Iron World reaches more people engaged in the metal business than the New York Tribune. Our rates are about ten cents per line. Which will pay the best

Sample copies mailed Free. Address

IRON WORLD PUBLISHING CO.,

No. 71 Grand street, Pittsburgh, Pa.

Sects and Creeds differ, but there are no dissenters from the general principle, that a great medicine is a great blessing. We have many of these blessings, but among them all, in the province to which it belongs, no greater than

## Tarrant's Effervescent Seltzer Aperient.

A column would not suffice to enumerate the ailments for which it is prescribed by physicians of the highest standing. It does not belong to the class derisively termed patent medicines, but is an article based on scientific analysis, and will stand the test of the sharpest and most rigid medical criticism as a cathartic, a stomachic, an anti-fertile preparation, and an admirable remedy for all bilious complaints. LET THERE BE NO MISTAKE. SECURE THE GENUINE ARTICLE ONLY.  
SOLD BY ALL DRUGGISTS.

## CAUTION.

## BETTS'S CAPSULE PATENTS

are being infringed by importation of Capsules made in contravention of his rights, which necessarily are numerous, BETTS being the original Inventor and Solo Maker in the United Kingdom.  
1, WHARF ROAD, CITY ROAD, LONDON, AND  
BORDEAUX, FRANCE.

VOLUME XXIII.  
Number 5.

## Ericsson's Solar Calorimeter.

We have spoken at different times of the experiments of Ericsson in measuring the heat of the sun with reference to the practicability of employing solar heat as a motive power. The editor of the *American Artisan* having kindly sent us an engraving of the instrument used by Ericsson in his experiments, we give the illustration with Ericsson's description condensed from *Engineering*, where it originally appeared, as follows:

It will be well to state at the outset that the solar calorimeter, and all my instruments constructed for investigating the mechanical properties of solar heat, are attached to a table which swings upon a horizontal axle, and which rotates round a vertical pivot, appropriate mechanism being applied for regulating the combined vertical and lateral movement in such a manner that the top of the table, composed of a heavy brass plate accurately faced, is at all times during observations kept perpendicular to the central ray of the sun. Hence, instruments whose base is at right angles to their vertical axle may be secured at any point of the face of the rotating table, without further adjustment. A graduated arc is attached to one end of this table, provided with an immovable index; consequently, the sun's zenith distance may at all times be ascertained by

error resulting from this assumption is, however, so trifling that the described graphic method of ascertaining the depth of the atmosphere may, without appreciable discrepancy, be employed in all latitudes.

The solar calorimeter consists of a double vessel, cylindrical at the bottom and conical at the top, an eight-inch lens being inserted at the wide end in the manner shown by the illustration. The interior is lined with burnished silver, and the space between the two vessels is closed at the top and bottom by means of perforated rings, as shown in the transverse section, the object being to distribute equally a

lower compartment containing four radial wings or paddles, the diaphragm being perforated in the center. The centrifugal paddle-wheel revolves on an axle which passes through a stuffing-box applied at the bottom of the double vessel, the rotary motion being imparted by means of a pulley secured to the lower end of the axle. The operation of this wheel, intended to promote perfect circulation of the fluid within the heater, is quite peculiar. It will be readily understood that by turning the wheel the centrifugal action of the fluid produced by the rotation of the paddles will draw in water downwards through the central perforation of

of fifty-two square inches of section, is placed at such a distance from the heater, that when the concentrated rays reach the upper end (painted with lamp-black) they are confined to an area of 3.25 square inches, precisely one-sixteenth of the sectional area of the sunbeam which enters the lens.

The loss of heat by convection and currents of air has been wholly obviated in the solar calorimeter, while the loss caused by radiation from the blackened surface of the heater has been reduced to a mere fraction. It may be contended, however, that the loss by radiation of the polished heater against the interior polished

surface of the calorimeter, although minute, is yet appreciable; and that some heat will be lost by conduction at the points where the heater joins the external vessel. Even these trifling sources of error, it will be seen presently, have been removed by the new method. A force pump and capacious cistern containing water are arranged near the calorimeter, a uniform temperature of 60 degrees being kept in this cistern by the usual means of a warm and cold water supply. By appropriate hose and the force pump mentioned, a constant current is kept up through the space between the internal and external casings of the instrument; hence, every part of the latter may be brought to a uniform temperature of 60 degrees in a few

ERICSSON'S "SOLAR CALORIMETER."

micro inspection, a very great convenience in an investigation which at every instant is dependent on the changing depth of the atmosphere through which the sun's rays pass. As this depth bears a fixed relation to the sun's zenith distance, it may of course be accurately determined by noting the position of the fixed index on the graduated arc, but as there is no time during investigations of this kind for computations, as already pointed out, I have constructed a graduated scale provided with a movable radial index, which, by being brought to the division corresponding with the observed zenith distance, shows the depth of atmosphere. It is proper to observe that in constructing this scale I have assumed the earth to be a perfect sphere of 3,956 miles radius. The

current of water to be passed through the space between the vessels. Nozzles are applied at the top and bottom of the external vessel, of suitable form to admit of small hoses being attached. A stop-cock with coupling joint is applied at the bottom, communicating with the interior of the calorimeter, and connected with an air-pump for exhausting the same. A cylindrical vessel, termed heater, with curved top and bottom, composed of polished silver, is secured in the lower part of the instrument, and provided with a conical nozzle at the top, through which a thermometer is inserted from without. Within the lower part of the heater is introduced a centrifugal paddle-wheel, surrounded by a cylindrical casing divided in two compartments by a circular diaphragm, the

the diaphragm, and force the same into the annular space round the casing of the wheel, thus an upward current will be kept up through this annular space uniform on all sides. This current, after reaching the top of the heater, will then return, first entering the open end of the casing of the wheel, and ultimately the central perforation of the diaphragm. I have been thus particular in describing this system of promoting uniform circulation within the heater because a proper indication of the actual mean temperature of the water contained in the same is the all-important condition on which depends the accuracy of the determination of the number of units of heat developed. It only remains to be pointed out that the lens, which is so proportioned as to admit a sunbeam

minutes. The process of measuring the solar energy is conducted in the following manner: The thermometer being withdrawn, the heater is charged with distilled water of a temperature of about 45 degrees, after which the thermometer is again inserted. The table supporting the instrument should now be turned towards the sun and the paddle-wheel put in motion. The indication of the thermometer must then be watched and the time accurately noted when the mercurial column marks 50 degrees on the scale, the observation continuing until the thermometer marks 70 degrees, at which point the time is again accurately noted. The experiment being then concluded, the table should be turned away from the sun. It scarcely needs

(Concluded on page 67.)

## MECHANICAL PROGRESS.

**SIEMEN'S RESISTANCE PYROMETER.**—The principle of this rests on the following facts: The electrical resistance of a conducting wire of given metal, at a fixed temperature, to a current of constant intensity, depends upon its diameter and its length; but when the temperature of the wire increases, the resistance increases. So that if we have a platinum wire of considerable length, whose electrical resistance at some known temperature is ascertained, we can determine some unknown higher temperature by determining the resistance at that temperature. The pyrometer consists of a tube of thin iron (to be inserted part way into the furnace) containing a porcelain spiral grooved cylinder, on which is wound a platinum wire. The ends of this wire pass through clay tubes inside of the iron pipe to a sufficient distance, and finally are covered with insulating material outside of the pipe. With the current constantly passing through the coil, the resistance to it may be measured either by the deflections of a magnetogalvanometer, or, preferably, by a suitably constructed differential voltmeter. The voltmeter used by Mr. Siemens consists of two voltmeter tubes, fixed upon graduated scales; which are so connected that the current of a battery is divided between them, with one branch including a known and permanent resistance, and the other the resistance to be measured. Changes of atmospheric pressure affect both sides equally, and therefore do not influence the results; but a reading at the atmospheric pressure is obtained by lowering the little supply reservoir with dilute acid to the level indicated in the corresponding tube. The upper ends of the voltmeter tubes are closed by small weighted levers with india-rubber cushions; after each observation these are raised, and the supply reservoirs moved so as to cause the escape of the gases until the liquid in the tubes comes again to the zero line of the scale, when the instrument is ready for another observation. The leading wires between the thermometric coil and the measuring instrument, would exercise a considerable disturbing influence, but this is eliminated by means of a third leading wire common to both branches of the measuring instrument. This can be used easily to determine at any time temperature even at points miles away.—*Engineer.*

**"PIANO-MECANIQUE."**—At the International Exhibition, Mr. Dehrain has exhibited a "piano-mécanique" or mechanical substitute for a pianist,—an addition to an ordinary piano, so that the instrument can be played on by machinery or in the usual way. On opening the lid of the piano, we see, according to the *Mechanics Mag.*, a row (about 5 in. long) of steel points, running transversely to the length of the piano. These points connect, by levers, with hammers placed above, and independent of, those used with the ordinary key board. In line with the points is a steel bridge, about 1 in. high, with a flat spring on its underside. A series of small boards—planchettes—are placed, face down, on the top of the piano, the end being brought under the bridge at starting. Each planchette has a rack which gears into a pinion just inside the bridge, which is actuated by a handle in front of the piano. The planchettes are provided with steel studs which represent the notes to be struck and are spaced according to the tunes, like the barrel of a hand organ. The handle being turned, the planchettes are moved, and the studs on them, by impinging on the steel points, cause the hammers to strike the strings. Each planchette represents a portion only of the composition, so that as the rear end of each approaches the bridge, the operator follows it up with another planchette. The forte and piano pedals are actuated by separate studs on the planchettes, elongated according to the duration of their action.

**A SIMPLE LOCK-NUT.**—The Oakley bolt is a most simple nut locking arrangement. On one side of the bolt the screw-thread is partially cut away, producing a flat surface. A triangular washer is stamped with a hole which corresponds with this form of the flattened bolt, and consequently cannot turn. An ordinary nut is screwed down on it and held by turning down an angle of the washer so as to clip the nut. A complete lock is thus obtained.—*Mech. Mag.*

**INCREASE OF NARROW GAUGE RAILROADS.** The first great revolution in railway practice is taking its successful course, not without strenuous opposition from prejudice, conservatism, and indifference; but all these obstacles and the difficulties they create directly and indirectly, are being swept away, as the conviction gathers strength that countries now unprovided or ill supplied with railways must soon have them, and that they must be productive, and not sources of loss. There is only one means by which this result can be achieved,—a reduction of gauge, an increase of gradients and curves—cheap railways in short—proper mechanical appliances for economically working traffic, and a rigid observance of economy in construction and in management. There are very few, even of those who have carefully followed the discussions upon narrow-gauge railways in these columns and elsewhere, who have any idea of the extent to which such constructive reform has now spread. The situation may be summed up thus: In India a gauge of 3 ft. 3 in. has been established, upon a scale that will bring into existence a system probably of thousands of miles. The reduced width will, in fact, become the gauge of the country. Australia, Tasmania and New Zealand are following the same course. Australia especially is determined upon receiving the reform and carrying it out fully. In Russia the 3 ft. 6 in. gauge is definitely accepted, and the results of its working will shortly result in construction of an enormous *reseau* of lines from north to south, from the Baltic, penetrating into Siberia. In Egypt the same width is to be adopted. In the United States more than 2,000 miles of narrow gauge are in actual progress, or about to be commenced. California is organizing railways on the reduced gauge in all directions; lines are being started in the unsettled territories of the west and north-west, where communications alone are required to convert uninhabited regions to wealthy agricultural or rich mining districts; in the Eastern and Central States, where energy and capital are most alive and plentiful, narrow gauge companies and organizations—not vague schemes, but promoted by engineers and capitalists, are urging the construction of independent railways, or of feeders to the existing lines. In Canada, where progress drags along most wearily, narrow gauge railways are being built; even for Prince Edward's Island contractors are at the present moment solicited to tender for the construction of a 3 ft. 6 in. line from Casumpec to Georgetown, a distance of 120 miles.—*Engineering*, June 30.

**WHITE'S ROLLING MILL.**—A model of this was exhibited at the London International Exhibition. It is intended to avoid the loss of time and other disadvantages attending the operation of rolling as ordinarily practiced by the shifting of the bar from one groove to the other, the turning it sideways for edging, etc. The system consists in the use of several pairs of rolls combined in one mill, some of the rolls being vertical and others horizontal, and they are so arranged that the bloom is compressed flatways and edgewise alternately through as many pairs of rolls as may be required for reducing the iron to its proper size. The machine is so constructed that the bloom enters the second pair of rolls before leaving the first, and so on through the entire series of rolls without stoppage, thus superseding all manual labor, with the exception of a man to throw the pile into the first pair of rolls, and another to take the bloom or bar away; and what is more important still, allowing the iron the smallest possible space of time to cool in the process. The system is more particularly applicable to blooming, roughing, or slabbing rolls, but, in many instances, it can also be applied to finishing rolls. The mill is capable of turning out a large quantity of work, the Aberdare Iron Company having made from 90 to 100 tons of iron in twelve hours by one machine.—*Eng. and Min. Jour.*

**THE RHIGI RAILWAY** has lately been opened. It runs to a height of 5,000 feet, and is constructed with three rails, the middle one of which is a rack intended to work with a pawl attached to the locomotive. Each train is composed of an engine and two carriages holding about 60 persons. The engine is always below the carriages.

To OLEAN and polish ivory carvings—first bath brick in powder, well sifted, applied with felt and spirits of wine, or with a circular brush, afterwards finely washed with oil and spirits. Nothing is better to finish with than ivory dust.—*Technologist.*

## SCIENTIFIC PROGRESS.

**GEOLOGY OF THE GREAT BASIN.**—From King's Report on the mining regions along the 40th parallel, we condense a few facts on the geological history of the region. The greater part of the rock of the interior mountain area (from the Sierra to the Wahsatch mountains) is a series of conformably stratified beds reaching from the early Azoi to the late Jurassic. In the late Jurassic these beds were raised, and the Sierra Nevada, the Wahsatch mountains and the parallel ranges of the Great Basin, were upheaved. Accompanying this upheaval, important masses of granite broke through, accompanied with quartz-porphyrries, felsite rocks, and, notably, syenitic granite, with occasional occurrences of granulite and greisen. Then, on the west side the Pacific Ocean, and on the east side the ocean which covered the Mississippi Basin, laid down a system of cretaceous and tertiary strata. These outlying shore beds, subsequently to the Miocene, were themselves raised and folded, forming the Pacific Coast Range and the chains east of the Wahsatch; volcanic rocks accompanying this upheaval as granites did the former one. Still later a final series of disturbances occurred, but these last had but small connection with the region of which this volume treats.

There is a general parallelism of the mountain chains and all the structural features of local geology, the ranges, strike of great areas of upturned strata, larger outbursts of granitic rocks, etc., are nearly parallel with the meridian. So the precious metals arrange themselves in parallel, longitudinal zones. There is a zone of quicksilver, tin and chromic iron on the coast ranges; one of copper along the foothills of the Sierra; one of gold further up the Sierra, the gold veins and resultant placers extending far into Alaska; one of silver, with comparatively little base metal, along the east base of the Sierra, stretching into Mexico; silver mines with complicated association of base metals through Middle Mexico, Arizona, Middle Nevada and Central Idaho; argentiferous galena through New Mexico, Utah and Western Montana; and, still further east, a continuous chain of gold deposits in New Mexico, Colorado, Wyoming and Montana. The Jurassic disturbance in all probability is the dating point of a large class of lodes: *a*, those wholly inclosed in the granites, and *b*, those in the metamorphic beds of the series extending from the Azoi to the Jurassic. To this period may be referred the gold veins of California, those of the Humboldt mines, and those of White Pine, all of class *b*; and the Reese River veins, partly *a*, and partly *b*. The Colorado lodes are somewhat unique, and in general belong to the ancient type. To the Tertiary period may be definitely assigned the mineral veins traversing the early volcanic rock; as the Comstock lode and veins of the Owyhee District, Idaho. By far the greater number of metalliferous lodes occur in the stratified metamorphic rocks or the ancient eruptive rocks of the Jurassic upheaval; yet very important, and, perhaps, more wonderfully productive, have been those silver lodes which lie wholly in the recent volcanic formations.

So far as we now know, no metallic veins occur in the Tertiary formations east of the Wahsatch mountains; whereas the remarkable metamorphism in the Tertiary coast ranges near San Francisco Bay, has developed extraordinary deposits of quicksilver and chromic iron.

Of the series of conformable strata forming the main central mountain masses, from 6,000 to 10,000 feet are true coal measures of the Carboniferous, but without a trace of coal, having been laid with rare regularity in the quiet depths of an ocean. The two bordering systems contain, however, near the upper limits of the Cretaceous, and upward into the Tertiary, important beds of coal. The California beds and those in the sandstones along the east base of the Wahsatch mountains, are Cretaceous; but the strata, as one goes east, change in character, and we finally get Tertiary coal.

**WATERPROOF FABRICS.**—There are five principal methods which have been proposed for rendering goods waterproof.—1. Waterproofing by means of a coating of gum or caoutchouc. By this method the pores of the fabric are closed and the access of air prevented. It is, therefore, unsuitable for clothing, and also too expensive; it does very well, however, for belting, tuhing, etc. 2. Covering the tissue with varnish or lac. It makes the goods

hard and liable to break. It is entirely unsuited for dress goods, for these reasons and also because it renders the cloth inflammable. 3. Impregnation with tar and paraffine. This coating does not last long, as it is destroyed and rendered inactive by the action of the air. 4. Impregnation with solutions of metallic salts, such as iron, copper, and zinc. By this method it is impossible to obtain true waterproofs. 5. Precipitation of alumina upon the fibre. By this method the tissue retains its suppleness; its weight is but little increased, and a perfect waterproof coating assured. The following are some of the receipts communicated: Beard & Downing use a mixture of linseed oil, rosin, Burgundy pitch, and caoutchouc, with a little petroleum added, and white lead. De Brun: 100 parts linseed oil, 15 parts litharge, 15 parts amber, 2 parts hydrated protoxide of manganese. Spill & Company: naphtha and caoutchouc. Bronman: 100 parts slacked lime, and 100 parts of soda, dissolved in water; add 270 parts of rosin, and 0.003 gum gut; the solution dissolved in boiling water, and 10 parts of alum added. Hirsch: 100 pounds linseed oil, 5 pounds copperas, 4 pounds zinc vitriol, 6 pounds caoutchouc. Stenhouse stretches the cloth over a hot iron plate, and rubs the paraffine into it; or the paraffine is melted in a tank and the goods passed through; or the paraffine, pure or mixed with steaming wax, etc., is applied in solution.—*Manufacture's Review.*

**COLORING METALS.**—C. Puscher, of Nuremberg, proposes a quick and cheap method of coloring the surface of metals by adding a coating of metallic sulphides. He dissolves 1½ oz. hyposulphite of soda in 1 lb. of water and adds thereto 1½ oz. acetate of lead dissolved in ½ lb. water. This clear solution heated to 190° to 210° F., decomposes slowly and precipitates sulphide of lead in brown flocks. If a metal is present, a part of this sulphide is deposited on it. Thus, there may be imparted to brass articles a color varying from gold to copper red, then carmine red, dark and then light aniline blue, blue white and finally reddish white, according to the length of time they remain in the solution. Iron takes a steel-blue, and zinc a brown color. Lead and zinc are entirely indifferent. If sulphuric acid is substituted in the solution for acetate of lead, brass is covered with a beautiful red, then green, then fine brown with green and red iris-glitter; this last is a very durable coating.—*Technologist.*

**HEATING BY WATER.**—"It occurred to me that the flow and return might be managed by the use of a single pipe, instead of two, as now universally adopted. I directed the experiment to be tried by affixing, to the socket-end of a four-inch pipe, an inch supply-pipe from an ordinary boiler, and a second pipe communicating with the bottom of the four-inch pipe and the bottom of the boiler. As I expected, the circulation was most perfect and rapid, the hot water flowing along the upper surface of the pipe, and the cold water returning along the lower surface. Two currents in opposite directions were created in the pipe, and the action was so perfect that I ordered, to be fitted up forthwith, a frame, which has been in operation ever since. This mode of heating by a single pipe may be, no doubt, of frequent use; and manifestly, from the simple and portable nature of the apparatus, the arrangement will commend itself to the attention of horticulturists."—*Alfred Smea.*

**THE SPECTRUM OF THE CORONA,** writes Prof. C. A. Young, is, in all probability, composed of at least four superposed elements: 1st. A continuous spectrum, without either bright or dark lines, due to indescendent dust. 2d. A true gaseous spectrum of the second order, consisting of a more or less bright continuous background with well marked bright lines. 3d. A true sunlight-spectrum (with its dark lines) formed by photospheric dust reflected from the solar atmosphere and meteoric dust. 4th. A mixture of the three named with the addition of the chromosphere spectrum. This light from the terrestrial atmosphere, like that reflected from particles near the sun, is evidently partially polarized in radial planes.—*Amer. Journal of Science.*

**ATOMIC WEIGHTS OF COBALT AND NICKEL.** At the suggestion of Prof. Gibbs, Mr. R. H. Lee, of the Lawrence Scientific School, Cambridge, Mass., has determined the atomic weights of cobalt and nickel. He finds these to be, for cobalt, 59.10; for nickel, 58.01.

[Continued from page 65.]

explanation, that during the elevation of the temperature of the water from 50° to 60° the instrument radiates toward the heater, and that while the temperature rises from 60° to 70° the heater radiates toward the instrument. In each case the amount of heat radiated, that is, the gain and the loss, is almost inappreciable, since both the heater and the surrounding internal vessel are composed of polished silver. The amount of gain and loss of heat by conduction at the points where the heater joins the surrounding vessel, if appreciable, evidently balance each other in the same manner as the gain and loss by radiation.

The weight of distilled water at 60° contained in the heater, and the weight and specific heat of the materials which compose its parts, being ascertained, the number of units of heat necessary to elevate the whole 20° may be readily calculated. To this must be added the percentage of calorific energy lost during the passage of the sun's rays through the lens. The sum will represent a permanent coefficient for each particular instrument, which may ever afterwards be employed to determine the dynamic energy of the sun's radiant heat. Obviously the indication will be equally correct during the winter solstice in a northern latitude with the mercurial column at zero, as during the summer solstice within the tropics, when the thermometer marks 100° in the shade.

## CORRESPONDENCE.

### A Trip to Colorado.—No. 4.

By OUR OWN TRAVELER.

From Golden I went to Central City, to visit this famous mining center. And here it occurs to me that, before writing further, it would be perhaps well to map out the routes. For I fear that many in California have but an indefinite idea of this great territory of Colorado. So I send you a drawing which, although very small, is large enough to denote the relative positions of the several places. In the drawing, D stands for Denver, G. C. for Golden City, C. C. for Central City, I. C. for Idaho City, G. for Georgetown, C. C. R. R. is the Colorado Central Railroad, D. & R. G. the Denver and Rio Grande, K. P. the Kansas Pacific, and B. V. the Boulder Valley.

#### Central City.

One's first impressions on getting into Central are not very favorable. You come over the mountains into the North Clear Creek Gulch, and ride up a steep and dusty road past Black Hawk to Central City, the two last places adjoining. You find the city built on the steep hillside, the streets narrow and not particularly level. There is no timber to lend beauty to the scene; the work of the miners has scarred the hills, and, besides the active mills and mines, you see works which are falling into decay.

Luckily one's first impressions are not lasting. An acquaintance with the people gives one different ideas. Greater kindness and hospitality I have never met with. The people here have had hard times, and the evidences of these are what strike one unfavorably at first. But no one ever stays any length of time in the place without getting the strongest belief in the growing betterment of affairs and in the future prosperity of the Territory.

At Central there are two hotels,—the National, R. B. Smock, proprietor, and the Conner House. Considerable fault has been found hitherto with the accommodations for travelers. Now the Central City folks have determined to direct their enterprise in this direction, and to remove all cause for fault finding. They have raised \$10,000 in cash, given "out and out," and a stock company is being formed with \$20,000 or \$30,000 more, for the purpose of building a first-class hotel. This is to be ready by next Spring; and I doubt not but that Central will then have a place second to none west of the Rocky mountains. This action shows the enterprise of the people of this section. Possibly, they have been too hospitable previously for the good of the hotels.

Central has two of the best papers printed. The Register (Collier & Hall, proprietors) is excellently edited, is full of enterprise, and is deservedly a most popular because a decidedly first-class sheet. The firm has a fine book and job office, and does most superior work. The Herald is filled with interesting news, is most ably managed, and is making its influence felt in the community. These two papers look well after the interests of the place, and by their live character are conducting ma-

terially to the prosperity of this section.

There are three banking houses here which do quite a large amount of business. I found the gentlemen of the Rocky Mt. National Bank very attentive to business and to the desires of those with whom they have to deal.

#### Visitors—Foundry, Etc.

I had the pleasure, while at Central, of meeting the members of the mining department of the Mass. Institute of Technology, who are on their summer excursion to the mines and smelting works of the country. The party is composed of Messrs. J. D. Ruukle (President of the Institute), J. M. Ordway (Prof. of Metallurgy), A. P. Rockwell (Prof. of Mining Eng.), Dr. S. Kneeland (Prof. of Zoology), R. H. Richards (Prof. of Mineralogy and Assaying) and J. B. Henck (Prof. of Civil Eng.); and five graduates and ten undergraduates. Besides studying mining and metallurgy on the ground, the party make collections of minerals, ores, products of the various processes, etc. This plan of summer expeditions is a leading and important feature of this institution.

The Central City machine shop is owned by the enterprising firm of Hendrie Bros., who also have works at Helena, Montana. This company has 15 men employed and turns out good work. An important feature is their manufacture of Bolthoff's patent pressed shoes and dies, of which I have given you a description in a previous letter. These give good satisfaction. They are also turning out Bolthoff's ball pulverizers, which are reported on favorably.

This machine, I am told, will pulverize 15 tons in 24 hours so as to pass through a 60 screen. The shop is now filling an order for a 20-stamp mill and one for a 10-stamp mill for mines in the Territory.

The Black Hawk Foundry is owned by Langford & Co., and ably superintended by S. S. Davidson. The company employs 12 men and does general repairing, etc., giving good satisfaction.

Cash & Rockwell have chlorination works, which are not running at present, but which will be started up at an early day.

#### Mining.

I find that a number of the mines are closed down. The reason of this is not altogether obvious. One cause is undoubtedly a want of co-operation among the companies. The claims are often of small extent, and the shafts are deep. There is much trouble with water, and instead of making liberal arrangements with one another, whereby the cost of pumping might be greatly reduced, or of consolidating a number of claims, there is contention between the companies, especially those which are controlled at the East. Each one fears that the other may gain some advantage, and a "dog-in-the-manger" spirit is shown. Consequently no one gains, but all lose; many rich mines lie idle, which otherwise might be worked. The ores are certainly difficult to be treated; but I yet fully believe, that, by consolidation, or by making mutual concessions, Central City and vicinity might be turning out much more precious metal than is now yielded. I have talked with very many persons on the matter, and have received from them the impressions which I have just noted.

To show what I mean I have prepared the following table from figures to be found in a pamphlet on the "Treatment of Ores in Gilpen County," by Mr. G. W. Baker. The first column gives some of the principal lodes, the second the aggregate length, the third the number of "companies" owning claims (exclusive of "private owners"), the fourth the average length of claims of the companies, and the fifth the approximate aggregate of shafting. I am sorry that I cannot give also the number of shafts.

Gregory.....	Length. 4,750 feet	Co.'s 11	Av. claim. 432 feet	Shafts. 5,000 feet
Mammoth.....	3,000 "	5	278 "	1,600 "
Doetail.....	725 "	6	145 "	3,000 "
Gunnell.....	1,200 "	5	235 "	2,000 "
Burnoughs.....	3,000 "	11	253 "	5,000 "
Bates.....	1,500 "	5	250 "	2,000 "

This table summarized gives these re-

sults. On 6 lodes, developed for an aggregate length of some 14,000 feet (and up to a depth of 500 feet) there are at least (besides private owners) 42 companies, owning claims of an average length of 283 feet; and on these lodes shafts are sunk to an aggregate depth of at least 19,000 to 20,000 feet.

As far as I can see, the actual mining operations carried on are performed by people here who are independent, for the most part, of Eastern capitalists. If I have spoken of mismanagement, it has not been with any idea of throwing discredit on the people here, who are most active and energetic, and bound to work out their own salvation. I shall speak further concerning the ores, milling, etc.

W. H. M.

[To be Continued.]

### The San Diego Mines.

#### Julian District.

EDS. PRESS:—Since my last letter, so many favorable developments have been made in the mines of this region, that I can but make a commencement in this letter, to give you a history of our progress. D. M. Snyder, Morris & Co., of San Francisco, who some weeks ago bought two-thirds of the CALIFORNIA claim in this district, returned here last week and are busily engaged in getting out timber preparatory to straightening and permanently retimbering the shaft, and will soon commence sinking. I believe the intention is to sink 400 feet. The work is being prosecuted with energy and will no doubt soon develop one of the first-class mines. The ledge has varied from 18 inches to four or five feet in width. Some of the ore has yielded \$1 per pound in a hand mortar, and \$57 by mill process. The OWEN's mine, which is the original discovery on the same ledge as CALIFORNIA, is now down over 130 feet; ledge about three feet wide, showing free gold. This mine always has paid well. They have a new whim, the first in the district, which greatly facilitates the work of sinking.

The VAN WEST Co. (not Van West as you generally print it) have commenced running a tunnel to strike their ledge about 125 feet deep. This ledge is small but is rich; the small quantity of ore extracted has more than paid all expenses. The HAYDEN Co. are sinking an incline, rock paying from \$30 to \$38 per ton.

The SAN DIEGO No. 1, owned by McMechan, Fox & Co., are sinking a shaft and have good pay rock; the last crushing paying \$22 per ton. The HELVETIA Co. are still sinking their shaft, are now down 140 feet, and have first-class ore; in fact, the best average ore ever shown in the mine, and a good well defined ledge. All of these mines are on the same belt or range, including many others that prospect well, but are idle for the want of capital.

The new mill of GUNN & REYNOLDS started up yesterday, runs smoothly and will no doubt do good work, having, in addition to the five stamps, facilities for concentrating and an improved pan for working sulphurets and concentrations. If it proves a success, they will have more work than half a dozen mills of that size can do, in which case they are prepared to add such additional machinery as they may need.

The VIRGINIA Co. are working the Virginia ledge in "Coleman district," two miles west from here, are down about 20 feet, have a ledge of 18 to 36 inches wide, and all prospects well.

#### Banner District.

Since our enterprising fellow citizens, Wilcox, Webb & Horrell, have completed the new wagon road down San Felipe Cañon, to Banner City, it affords the citizens of Banner & Julian one of the best roads in the country for a pleasure excursion. The grade is very easy and the road shaded the greater portion of the way by pine, spruce, alder, and sycamore, making it delightfully cool and pleasant, with plenty of clear, cool water all the way down the cañon. San Felipe Canon is always cheerful and lively, having so many rich ledges with mills, arastras and hand mortars always running, that every man is a millionaire, and don't seem to care "whether school keeps or not." When they can't get their ore satisfactorily worked in the mills, they start an arastra; and when the ore is too good for that, they pound the best of it in a mortar. So they are sure of good returns.

The KENTUCK Co., under the superintendence of M. A. Lewis, controlled by McDonald & Whitney, of San Francisco, who have recently bought the mine, started up the work of sinking this week with full force, and on yesterday they struck some more of the rich ore for which that claim has been celebrated, being literally filled with gold. The MADDEN Co. on same ledge, have their usual amount of rich ore, and the ledge is improving every foot they sink. The last ore worked paid over \$40 per ton. The ANTELOPE Co., on the same ledge are still running their new 5-stamp mill on their own ore, paying \$70 per ton. The REDMAN mine, under the supervision of J. M. Tiernan, is looking well. In sinking the shaft, the ledge pitched to the west into the hill, where it was about 4 feet wide. Last week a new and small ledge made its appearance in the shaft, showing free gold and silver sulphurets. It has increased, until it now covers the bottom of the shaft, with slate intermixed. The prospects are very flattering indeed for a large and rich ledge, when the two ledges come together.

The additional machinery brought here and added to McMECHAN'S MILL, will probably be started up for regular work to-day. It consists of a 16-horse power engine, a Varney pan (latest improved), a large wooden concentrator, and copper shaking table of Tiernan's own invention. If they do not do first-class work, there is no use in having good machinery. Tiernan has shown himself a man of energy and competent to carry on such work. We want more of such men as he and Snyder, of Julian, and this country would soon have a character for rich mines second to no mining district on the coast.

The BAYLEY Co., on the south end of the Redman ledge, are taking out ore, to work by the new process in McMechan's mill. They have a large ledge and rich ore. The KINO ledge, GOLDEN CHARIOT mine and Co., are still sinking in rich ore, on their big ledge which at the depth of 50 feet is 4 to 5 feet wide. The LITTLE JOKER, which was 3 or 4 inches wide on top, of soft decomposed chalky-looking ore, rich from top to bottom, is now 48 feet deep, and 2 feet wide, with some ore, that report says is worth from two to five dollars per pound.

There are many other mines that I would like to mention, but it will require too much of your valuable space. I will close by simply saying, of all the mining districts on this coast, I have not heard of one that can show as many paying ledges and rich prospects, or as much work done and paid for out of the mines themselves, or from a like quantity of ore worked, that can show as good returns, with as good a climate, timber, water, and everything to make the locality desirable for health or a home, as Julian and Banner districts, San Diego county, California. Since McDonald & Whitney and Snyder, Morris & Co., have been interested in our mines, strangers and capitalists are coming in more freely and times looking up.

I have just heard from the STONEWALL, Capt. A. P. Frary's mine, and the ledge has enlarged to 12 feet in width and the rock is every pound worked and pays well, I will tell you more about it in my next letter.

Julian City, July 20, 1871.

L. B. H.

### A Handsome Acknowledgment.

MESSRS. DEWEY & Co.: We hereby acknowledge the receipt of the patent papers for our improvement in wheels for traction engines, and also the notice that the improvement on tubular boilers had been allowed; and in this connection we think we should exchange congratulations for the uniform success that has attended your applications for us, this being the twelfth patent we have obtained through your agency, within ten months, for our American Overland Steamer—a success due to the careful and full preparation of the cases before they leave your office, and a thoroughly live man to attend to them when they arrive in Washington; and perhaps we might modestly add, the intrinsic merits and originality of the ideas themselves. Such promptness and success in obtaining patents we think unparalleled.

Respectfully yours, O. HYDE & SON.

Oakland, August 1, 1871.

EUCALYPTUS LEAVES FOR DRESSING WOUNDS have been tried at a hospital in place of lint. The leaves which have a peculiar smell, are merely laid upon the wounds. Their balsamic nature not only aids in the curative process, but after a few hours all unpleasant odor from old wounds or sores, ceases to be perceived.

# MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### AMADOR COUNTY.

**THE STRIKE.**—The difficulties with regard to the strike seem to be over. No further difficulty is apprehended.

### ALPINE COUNTY.

**NEW MILL.**—*Miner*, Aug. 2d: The Tarshish Co. are to erect a mill for the reduction of their ores, forthwith.

### EL DORADO COUNTY.

**Mountain Democrat**, July 29th: H. Louis & Co., struck a rich streak in the 23d inch and took out \$400. On the next Friday they took out \$300 in one hour. This company has heretofore been laboring for very little pay.

### INYO COUNTY.

**BULLION.**—*Independent*, Aug. 2d: Wells, Fargo & Co., from the works of J. W. Mc Murray, at Fish Springs, 67½ ounces of gold bullion, valued at \$17 per ounce.

### NEVADA COUNTY.

**A BIG CLEAN UP.**—The Marysville *Standard*, June 29th says: The Blue Point Gravel Mining company, at Smartsville after a run of 44 days, cleaned up last Saturday \$23,000. Yuba county still maintains her reputation as having the richest mine in the State.

**MINING LOCATIONS.**—C. P. Purriington, and others, have located six claims on a Quartz ledge situated on Gold Flat, about one and a half miles from Nevada. Michael Byrne & Co. have located 800 feet on Democrat Hill.

**GRAVEL MINING IN GRASS VALLEY.**—*Union*, July 30th: The Altona Co., whose main tunnel is in 350 feet, is taking out gravel from a cross-cut south for the purpose of ascertaining the width of the lead; 50 feet gives no indication of the width of the lead in that direction. The gravel averages three to five feet in thickness and shows gold while being picked up by the miner, and the pay dirt, as hoisted, prospects from 25 to 60 cents to the pan.

The Hope Gravel is working as usual. J. Jeffrey is Superintendent and also supervises the Altona and Hope. Mr. Jeffrey is a practical miner and operator on Alta Hill for many years, and is posted in mining in that locality.

Alta Co. No. 3 is taking out gravel and cement, for the crushing of which a ten-stamp mill is in course of erection.

The Dartmouth company have erected a water mill for crushing the gravel they are taking from the upper strata of Alta Hill, but are unable to start up,—water for the purpose not being attainable.

**QUARTZ MINING IN GRASS VALLEY.**—Same paper says the Empire company has obtained a Government patent for their claims on Ophir Hill. The mill runs 12 hours out of the 24, and will be running on full time. The miners underground are rapidly opening up, so as plenty of ore can be used for crushing.

**SEVEN-THIRTY.**—This mine, after lying idle for some time, has again been started to work. The crushings we are informed have paid largely in addition to specimens. The company have taken measures to secure a patent for the mine.

**THE ERIE MINE**, located about a quarter of a mile north-east from the Seven-Thirty mine, or about four miles from Grass Valley, is owned by Talbot and Hunt, who do all their own work. Yesterday, July 29th, a clean up was made at the Gold Hill mill, of seven loads which had been crushed. The owners will push work in sinking and developing.

**THE DAISY HILL** continues to take out splendid ore. At a recent crushing of 35 loads—15 paid \$40 to the ton, and 10, \$53. The owners are developing the mine rapidly.

### PLACER COUNTY.

**STILL CONTINUES RICH.**—The *Herald*, Aug. 20th, says the strike made near the St. Patrick, of which we made mention two weeks ago, by some Swedish boys, Johnston & Co., holds good and is panning out terribly. Fifteen hundred pounds of the rock has paid about \$7,000; pounded out in a hand mortar.

**THE GREEN MINE.**—Same paper says: Some magnificent specimens have lately been taken from this mine. The mine is very rich where they are now at work.

The Bellevue mine is looking exceedingly well; have out 180 tons, estimated \$40 rock. The erection of a 15-stamp mill is recommended.

**RISEING SUN.**—*Stars and Stripes*, July

27th: Reports from this mine, near Colfax, are very favorable. A late two weeks' run yielded about \$6,000—the run for the month will reach \$12,000. Dividend for June, \$1 per foot; that for August will probably be \$3.

**GOLD RUN.**—Same paper says the mines here have organized to procure patents for their claims. Good reports are received from mines here.

**IOWA HILL.**—The miners in this vicinity are jubilant over the fact that the Von Schmidt enterprise will soon bring them an abundance of water, which will make valuable much mining ground that is now comparatively worthless.

**YIELD OF MINING GROUND.**—A correspondent of *Stars and Stripes* estimates the average past yield of ground per cubic yard, as follows: Iowa Hill, 71 cents; Independence Hill, 25 cents; Roach Hill, 60 cents; Richardson Hill, 15 cents, and Wisconsin Hill, 12½ cents.

**COST OF HYDRAULIC WORKING.**—Same correspondent says parties in Gold Run district estimate the cost of working there at 2 to 3½ cents per cubic yard. It is estimated that the cost of working at Iowa Hill will be 2½ cents; Independence Hill, 2 cents; Roach Hill, the gravel on which is much harder than in the other places named, 6 cents; Richardson Hill, 3 cents, and Wisconsin Hill 2 cents.

### PLUMAS COUNTY.

About Folsom, says the *Telegraph*, the miners are busy in all directions, sinking shafts, running tunnels, drifting and washing up. We hear of numerous good yields, amply sufficient if all were known to satisfy the most skeptical, that the mines about Folsom are by no means washed out.

**MILL BURNED.**—The Caledonia mill at Cherokee, was burned on Saturday, July 22d. It belonged to the Bank of California. The hoisting works, shops, etc., of the English Co., near by, were also destroyed.

### SAN DIEGO COUNTY.

**CLARK DISTRICT.**—Los Angeles intelligence says that the Clark District mines continue to attract attention, and very rich ore is being forwarded. Considerable ore is being shipped to this city.

**THE ZAPATA MINE**, on Sau Gabriel river, which has been worked with varying success for several years, is reported as increasing in its promise of prosperity, both as to the width of the vein and the quality of the ore. The placer diggings, also located on the upper San Gabriel, are said to promise well.

**SAN DIEGO** dates of the 20th say that reports from the Julian District are very favorable. The Redman mine struck a ledge ten feet wide, the ore of which pays \$100 per ton.

### SIERRA COUNTY.

**STRUCK GRAVEL.**—*Messenger*, Aug. 2:—Helmet & Co., working on Goodyear's creek, have got their tunnel into gravel which prospects very rich. The prospects are good for an extensive, paying claim.

### SOLANO COUNTY.

**QUICKSILVER.**—*Vallejo Chronicle*, July 29:—The new quicksilver mines are about four miles from Vallejo, and half a mile from the Sulphur Springs. The developments are so favorable that the owners, Barron & Co., of S. F., have decided to erect the proper furnaces, etc., for the reduction of the ores.

## Nevada.

### COPE DISTRICT.

**BULLION SHIPMENT.**—*Elko Independent*, July 29:—During the month of July, the shipment of bullion from Cope District through Wells, Fargo & Co.'s office, in Elko, amounted to \$15,605.

A correspondent of the *Independent* from the eastern part of the district gives encouraging reports from Spruce mountain, 40 or 50 miles south of Humboldt Wells; also from the Alabama district 35 miles south of Toano. Rough and Ready district, 7 or 8 miles from Thousand Spring Valley, shows good galena float. The same indications occur ten miles south. Efforts are being made to discover the ledges from which these specimens were derived.

Another correspondent of the *Independent*, writes as follows:—"From what I have seen of Railroad district, I am led to believe that it has before it an exceedingly brilliant future. Two rival cities are springing up there only three-quarters of a mile apart."

### ELY DISTRICT.

**BULLION SHIPPED FROM PICOHE.**—The *Ely Record* of July 20, says Wells, Fargo & Co. shipped, from July 14 to 18, through their agent, B. F. Sides, bullion valued at

\$37,270.92. That shipped during the quarter ending June 30th, was in value \$576,807.

### EUREKA DISTRICT.

**LARGE BULLION YIELD.**—*Sentinel*, July 30th: Two furnaces of the old, and two of the new pattern of the Eureka Consolidated produced in twenty-four hours, ending yesterday morning, forty-three thousand and two hundred and ten pounds, valued at \$390 per ton, making a total of \$8,425.

**NEW FURNACE.**—The Phenix Silver Mining Company is erecting a new furnace on the site of their old one, of enlarged size, and of a size altogether superior. It will be running in a few days, when rich bullion will be in great plenty to ship to San Francisco.

**NEW MILL.**—Parties from San Francisco have purchased a mill site below the Consolidated furnace, where they propose to erect a 20-stamp mill immediately. The milling ores of this district are attracting attention from capitalists, and we shall not be surprised to see this vicinity lead all other places in a few months in the amount of silver bars produced, as it now does all other places on the continent in base bullion.

**THE LARGEST SALE IN THE DISTRICT.**—The valuable mining and landed property of Geddes & Bertrand, situated in Secret Cañon, has been sold to San Francisco capitalists. The property is very valuable. Details will soon be made public.

**ANOTHER SALE.**—It is stated that the Richmond Mining Co. has disposed of all their property in this district to a company in London. A cable dispatch from J. J. Dnnne, is the foundation. We presume it is true, and that he will be at home in 20 days.

The Phenix Silver Mining Co. of this place, has levied an assessment of 50 cents per share. The large outlay in the purchase of mines and the building of a new furnace has made this course necessary. The large quantities of ore at the dumps, when smelted, will enable them to declare very considerable dividends at no distant day.

**MINERAL HILL ITEMS.**—The same paper says for the month of March last, the 15-stamp mill at Mineral Hill, cleaned up \$120,000 in silver bullion, and the average for each month since has been \$85,000. The mill is now stopped for want of water. To obtain a full supply of water hereafter it is proposed to lay pipes to Cave Creek.

The English Co. that has purchased the entire property of the old Co., has contracted with Booth & Co., to put up a 30-stamp mill, which is to be completed by the 8th of October next. Water for the mill will be obtained from Cave Creek, or from Dougherty or Cole's Creek.

George Attwood is at the present in charge of the affairs of the Co., and will remain until Mr. Lewis arrives. The latter will have charge permanently, of the affairs of the company, and will have the superintendence of the mill and mines.

**INCREASED IN VALUE.**—The Mineral Hill Co., of which Northey, Ward and three others were the discoveries were sold to Lent & Co., for \$500,000, and by them to another company for \$1,120,000, and they have sold to a London company for \$2,120,000. The mines of Eastern Nevada are becoming exceedingly popular in the Old World.

**FISH SPRINGS DISTRICT.**—This new district is situated about 18 miles southwest of Eureka, and the best road by which to get there is by Spring Valley, and then down Spring Valley Cañon where the water will be found and the camp of the prospectors.

The district was organized a few days since, and about 20 claims have been recorded. The claims are situated upon a low hill of a few acres, and the discoveries so far made do not cover but a few acres in extent.

The appearance now indicate, on the east side of the hill, that there are regular veins of quartz and the west side seems to be entirely carbonate and galena ores. The carbonates at the surface, assay from \$30 to \$35, while the galena has assayed as high as \$400.

### HUMBOLDT.

**PUEBLA DISTRICT.**—*Silver State*, July 29: Quite a number of men are at work in this district who are opening up some promising mines containing copper ore, with silver and gold. The nearest point to the railroad is 80 miles. The country is also filling up with stock growing and has a large amount of valuable grazing lands.

**FROM RELIEF DISTRICT** encouraging reports are received. The Pac. Co.'s mill is nearly completed and will soon be crushing. Many hundred tons of rock are ready for it.

**ITEMS.**—The Banner mine in El Dorado

Canon has fallen into new hands, from which much is expected.... This season will witness more of the old mines made valuable, than all the previous years since the mining excitement of 1864-5.... New gold placer diggings are reported in the Flat Creek county. It is supposed there are big things there.... A furnace is to be built by the Arizona Mining Co., at their new tailings mill. The bullion shipped from this mine for the past week was \$8,295.

**THE SHEBA.**—The developments in this mine has encouraged the De Soto folks to resume work, and their prospects are very flattering.

### REESE RIVER.

**MINING SALE.**—The most important purchase of mining property ever effected in this district, says the *Reese River Reveille*, was made by the Manhattan S. M. Co., of Nevada, on Saturday last. The property was bought at Sheriff's sale, for \$60,000 in currency, and is cheap, for it comprises 40 different and distinct locations, all of them made during the first months after the discovery of the Reese River country.

### WHITE PINE.

ONE of the richest strikes ever made in the district, says the *White Pine News* of July 24, was made on Saturday morning in the Original Hidden Treasure mine. We saw some of the ore (said to be an average) brought down for assay. To use a miner's phrase, it was perfectly lousy with chloride, horn, ruby, and native silver. An assay made by Smolz, of McCollough & Co.'s assay office, gave the figures of \$3,635 per ton—and 3½ pounds smelted by him gave a bar of silver 968 fine, weighing 4.40 ounces. The face of the ore is over eight feet in width, with a depth and an extent unknown. Treasure Hill is panning out heartfully.

### WASHOE.

**BULLION.**—Gold Hill *News*, July 27th: Bars to the value of \$44,000 were received at the Bank of California, Virginia, principally from the Yellow Jacket and Crown Point mines.

**CHOLLAR BULLION.**—The bullion shipment from the Chollar-Potosi mine last Friday amounted to \$42,000.

**ORE YIELD.**—Same 27th: Last week 2,250 tons of ore was extracted from the Savage mine, the average assay value of which was \$33 per ton. The Hale & Norcross yielded 439 tons.

**ITEMS.**—The Gould & Curry shaft is now down 1,285 ft., ground working favorably, and good progress is made. A new station will be opened at the 1,300-foot level.... Considerable low grade ore is being taken from the old upper workings of the Kentuck mine, and the 600 and 700-foot levels also yield plenty of ore of a high grade. The 400-foot level is being opened out for practical working.... The Caledonia mine is yielding a superior quality of ore from the breasts between the 200 and 300-foot levels.... The Buckeye mine is yielding no ore at present, but the drifts north and south from the old incline show considerable ore of good quality.

**THE SUTRO TUNNEL COMMISSIONERS.**—Says the *Virginia City Enterprise*, are quietly pursuing their investigations, and have visited most of the mines on the Comstock lode. Their report will be one of the highest value to our mining interests. The investigations are not confined to the Comstock lode, but also embrace the county east and west, and they have visited several of what are called outside claims.

**LADY BRYAN.**—Same of 30th: An excellent body of ore is said to have lately been developed in the south portion of this mine. They expect that their next run will be better than any yet made, as the ore assays better than any they have yet worked—over \$100 per ton.

**SALES OF MINING PROPERTY.**—Messrs. Parke & Bowie have bought the old Gould & Curry mill, with all the out-buildings roads, etc., appertaining thereto.

The Crown Point Co. has bought the Yellow Jacket or Morgant Mill, on Carson river. The old machinery, with water wheel is to be removed and new machinery, with steam power will be substituted. This change from water to steam in this mill will be favorable to the Mexican mill above and Brunswick below.

**OVERMAN NEW SHAFT.**—Work will be commenced immediately on the Overman shaft, to be sunk at a point 1,500 feet east of their present shaft. Mr. Myrick, the Superintendent, says he will have the shaft down 300 ft. within sixty days. At the depth of 800 ft. the first drift for the vein will be started. This is the best move the Overman folks could possibly have made, as they will see before eight months have passed.

**BUCKEYE MINE.**—In cleaning out the old

incline of this mine, a body of excellent quartz, some eight feet in width, has been found. The ore taken from the deposit in early days was thrown out upon the dump with the waste rock, but afterward outsiders found it there and overhauled the dump, collecting and sending to the mill all they could find of it.

The Sierra Nevada mill is running day and night upon ore from the Co.'s mine. The ore is of a low grade, but the supply is almost inexhaustible.

The Santiago Mill situated on the Carson, has been thoroughly overhauled. The two old water-wheels have been torn out and a new double turbine substituted, and everything about the mill has been put in first class order.

Arizona.

CASTLE DOME mining district, according to the San Diego Union, continues to improve. The 'Flora Temple,' has some 400 tons ready to sack, which assays about \$90 to the ton. The 'Flora Tweed' has a belt of metal 3 feet 9 inches, and widening. The 'Jack Hamilton' has struck it rich.

RICH PLACERS, it is thought, according to a correspondent of the Miner exist in the eastern district of Central Arizona. In the year of 1861, Mr. Thomas Miner was one of a company of miners who went on a prospecting expedition into that hitherto unexplored region. They found placers which, in Mr. Miner's opinion, will yield from \$20 to \$150 per day, to the man, by sluicing, and extending over an area of country sufficient for 5,000 miners, or more, with timber and water in abundance. They were permitted to remain in the mining district only some two months, on account of the Indians. Since that time Mr. Miner has made several unsuccessful attempts to raise a company to get back, but has never had promise of success till within a short time. A company of 48 names is now enrolled to start from Bradshaw. It is expected the number will be increased to 80 before they start. Important developments are expected for this expedition.

Colorado.

MILL BURNED.—The Washington mill, at Georgetown, was burned on Thursday, the 20th ult.—cause accidental—started in the engine room. The mill will be immediately rebuilt on an improved plan.

IDAHO DISTRICT.—Favorable reports are received from this district.

NEW FURNACE.—Central City Herald, July 26th: F. W. Crosby has put up a 20-ton furnace at the Peck mill, in Empire—will be in operation next week. Parties in placer mining are doing well about Empire.

A STUPENDOUS ENTERPRISE, organized some time since by Manson Shelton, Frank A. Pope and John Burkholder, for the purpose of prospecting both slopes, north and south faces of Leavenworth mountain, by boom ditching, has been in operation for some time. Five cuts have been made on the north slope of the mountain, in one of which the debris has been stripped to the bed-rock and ten loads laid bare. Ten good lodes discovered on Leavenworth mountain! Here is encouragement for the completion of the Helmick Tunnel.

CARIBOO—GRAND ISLAND DISTRICT.—Same paper says: A large amount of ore is coming to Hill's from Cariboo. About midway between Cariboo and Pomroy mountain a new group of lodes has been discovered on which promising developments are being made.

ITEMS.—The Boulder County lode is coming out finely. It is rumored that E. V. Smith is about to buy the Trojan mine, and put machinery thereon. Ore has been taken from the Carlo, from which a \$600 assay has been made.

NEW REDUCTION WORKS, ETC.—Cariboo Post, July 22d: We hear that Corning & Co. purpose the erection of some kind of reduction works at the French boy's ranch on the north Boulder. Much interest is centering on that mining section. The Boulder lode, owned by Conger & Stevens, is one of the most promising locations on the Grand Island silver belt. Encouraging reports are received from Long & Halverson's stamp mill north from Ward. There are splendid mines there. The Morning Star lode is a brilliant promise. The Idaho is bound to shine in more than former splendor. Good smelting ore is accumulating on the dump of the Potosi.

SUMMIT COUNTY.—Central City Register, July 26:—There are many promising gulches about Ten-mile creek, some of which will pay \$10 per day to the hand. Immense wealth has been taken from the famous McNulty Gulch, near its head. A ditch 10 ft. wide and 2 ft. deep, to carry 5,000 inches of water is being constructed to work some of these mines.

Effects of Sulphur on Wine.

In a late issue we gave Prof. Weidenman's opinion of what became of the sulphur used upon the grapevine—that it was converted into sulphate of lime (gypsum) by uniting with the lime in the soil, and thus continued its beneficial action as a manurial agent. But it appears from De la Vergne's "Practical Instructions" in the manufacture of wine, that all the sulphur does not find its way to the soil. That author says:—

A bad flavor is sometimes communicated to wine from the remains of sulphur on the grapes, and serious objections to the use of the remedy were at one time raised on this account. This taste it has, however, been found easy to get rid of by drawing off. If one operation does not suffice, a second in the manner described below will be sure to succeed.

Rinse carefully your empty cask, first with cold and then with warm water, then again with cold, for every forty gallons it will hold, pour in a quart of clean water, and leave it there. Burn within the cask, for every forty gallons it will hold, one square inch of rag or wick incrustated with sulphur by being dipped in it while molten; close the bung tightly, and roll and shake the cask to let the water within it absorb well the vapors of sulphurous acid produced by the burning. Into the cask thus prepared, draw your wine, doing this by means of buckets, and not by any of the modes contrived to exclude the air, since contact with it helps to disinfect the wine.

But be careful to leave all lees behind; therefore do not tip the cask. The thicker wine remaining with the lees must be settled by putting it in a smaller vessel, and then drawing off by itself in the same way as the other. Any portion of the lees carried into the fresh cask under the influence of a slight subsequent fermentation, will again form sulphureted hydrogen, which constitutes the bad taste in question.

To the above the editor of the Western Pomologist adds as follows:—

This sulphureted hydrogen decomposes when brought in contact with the sulphur-coated rag or wick, and thus the objectionable flavor passes off. But it will be slight enough to go away in the ordinary drawing off which must necessarily be performed for other purposes, unless sulphur has been applied to the vines late in the season, and in needlessly large quantities, and no heavy rain has come to wash it off, nor sufficient heat intervened to vaporize it away. But the slightest inconvenience of this sulphur flavor, so easily got rid of, is an inconsiderable evil compared with what results when, in absence of the proper remedy, the mildew, or its remains, passes into the wine. For which reason it is always well to sulphur vines whenever any considerable attack of the disease occurs late in the season, even though it comes too late to injure the fruit; for by fastening on such parts of the fruit-stems as yet remain green, it can maintain a foothold until vintage, and so find entrance into the press or vat.

M. Mares thinks the small quantity of sulphurated gas that will ordinarily be found in the new wine is valuable to preserve it, and thinks, too, the wine made of sulphureted grapes is more even in quality, has a brighter color—very important in red wine—and keeps better than any other wine.

De la Vergne thinks the time will come when those who buy wine of the producer will be glad to hear him say:—"My vines were thoroughly sulphured," and we all know that in commerce it has long been the custom to fumigate wine casks, without complaints being made of any bad effect resulting therefrom.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

EXCELSIOR MANUFACTURING CO.—July 31. Capital Stock, \$300,000 in 3,000 shares. Trustees: S. B. Boswell, J. Y. Wilson, W. LeRoy, W. L. Merry and C. T. Forrest.

CROWN POINT SOUTH EX. M. Co. Gold Hill, Nev.—Aug. 1. Capital Stock, \$1,000,000, in 10,000 shares. Trustees: C. J. Brenham, A. J. Moulder and W. B. Johnston.

Meetings and Elections, Etc.

CALIFORNIA M. Co. Trustees: D. D. Colton (President), M. S. Latham, J. D. Fry, H. K. White and G. Wallace (Secretary).

CAMP FLOYD S. M. Co.—Trustees: G. Hearst (President), W. Thompson, Jr., G. S. Dodge, A. E. Head and F. W. Eaton. Secretary, W. Willis.

Mining Stock Market.

[San Francisco Stock and Exchange Board.]

THURSDAY EVE., AUG. 3, 1871.

The mining stock market was quite steady at the end of last week, then prices gradually declined with somewhat of a reaction on Wednesday. Amador has sold at \$285. Eureka fell from \$20 to \$11 and then rose to \$17 1/2.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock during the week.

	July 27 Highest.	Lowest.	Aug 3 Adv.	Dec.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

We were happy to receive a call to-day from Wm. H. Murray, special traveling agent and correspondent of the well known and ably conducted Scientific Press of San Francisco.

This is the best practical mining journal in the United States, and should find a welcome in every household. Mr. Murray is here on business connected with the paper, and will canvass this county for subscribers before his departure.

We cheerfully recommend the Scientific Press to our readers as worthy of their support and patronage.—Central City Herald, Colorado.

WOODLAND, July 14, 1871.  
DEWEY & Co.—Gents: I received the interesting paper on my improved wagon all right, and I return thanks for the promptness with which you pushed it through.

Respectfully, C. ELLIOTT.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost, \$67.50. Part of the money may be paid in installments. By a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at John I. Tay's, Broadway, Oakland. apl-4t-4f

\$5 TO \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-Strand White Wire Clothes Lines, to last forever. Don't raise this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 16 Dearborn street, Chicago, Ill. 23vl-12mbp

LADIES DESIRING TO PURCHASE A FIRST-CLASS SEWING Machine at easy monthly installments may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave., New York. Good work at high prices if desired. 23vl-12mbp

## PATENTS & INVENTIONS.

### Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING JULY 18TH.

SIDE-HILL PLOW.—Daniel C. Day, San José, Cal.

WELT-TRIMMER FOR BOOTS AND SHOES.—Joseph H. Allen, Wadsworth, Nevada.

FARM GATE.—Michael Barthel, San Francisco, Cal.

APPARATUS FOR SAVING GOLD, AMALGAM, ETC.—George R. Evans, Virginia City, Nevada.

PROJECTILE.—Thomas Hill, Vallejo, Cal.

TRACTION-WHEEL.—Oliver Hyde, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

### Railroad Matters.

#### Oregon and Washington.

Work seems to be pushing on the Northern Pacific, and we see it announced that the company have difficulty in getting the requisite number of workmen. Some 750 men are employed on the western division, and the 25-mile section is to be finished in October. Besides this, it is affirmed that the road will reach Puget Sound early next summer. Eastern papers say that a good route has been found through Central Dakota, striking the Missouri near the mouth of Hart river. A party is soon to leave Kalama to survey a route from the Yellowstone to the Snake river.

The Portland, Dalles and Salt Lake R. R. project is still being agitated in the Oregon papers, and it is said that Congressional aid will be invoked at the next session.

The Willamette Valley (late Oregon Central or West Side) R. R. Co. is grading and track-laying. That part between Portland and Hillshoro was reported as rapidly progressing at last accounts. Preliminary surveys are being made on the Columbia and Willamette R. R.

On the Oregon and California R. R. work is pushing rapidly, and 180 miles south of Portland are promised to be in running order by the end of the year. A line has been run through Oakland, Douglas county, and the cars are to run into Eugene by the middle of August.

#### California.

On the California and Oregon road, a large force was put at work in the beginning of June, at Tehama, one hundred and twenty-seven miles from Sacramento, to which point the road was completed last year. The bridge here was to be built in about six weeks, and then grading was to be done up to Red Bluff, with a chance of reaching Shasta this year. The Yreka Journal of July 28th, says: Hood and party, surveyors for the Central Pacific Railroad Company, have commenced preparations for another survey of the railroad route through Shasta valley. It is believed they are now laying out the permanent route, which will run down Shasta river, on the opposite side of the hill east of town, and proceeding along the valley about two miles east of the Little Shasta bridge, or about eight or nine miles east of Yreka.

On July 19th, certificates of incorporation were filed of the Northern R. R., for an "air line from San Francisco to Tehama." The officers are officers of the Central Pacific, who have also organized the San Pablo and Tulare R. R. Co. The rails for the Tehama road are said to have been received.

The great railroad topic of late has been the rumored purchase of the California Pacific by the Central Pacific, or of both by the Pennsylvania Central. The city papers give more credence to the former; Eastern and Sacramento papers to the latter rumor. The California Pacific has stopped work on the Sonoma extension between Adelante and Petaluma, and the survey has ceased on the line between Davisville and Red Bluffs. The southern coast steamship opposition (between here and the southern counties) is also reported purchased by the Central Pacific, and their

vessel has been laid up (temporarily it is stated, but without announcement of resumption of her trips), while fares on the other line have been advanced. It is said that the air-line from Sacramento to San Francisco will still be built, and that contracts therefor have been awarded.

The effect of any such consolidation will have a very great influence on this State. It very likely will lead, among other things, if the Central Pacific is the purchaser, to the more speedy completion of the Southern Pacific, while it will put off the building of some other proposed lines.

The Sacramento Record is informed that the Central Pacific Railroad Company has bought the Placerville Railroad, which extends from Folsom to Shingle Springs, and will take possession of the same immediately.

Humboldt county has a plan for a road from Eureka to Singler's Ferry, on Eel river, to be built by November, and thence to be carried to the mouth of Van Dusen's Fork. For this a subsidy in the shape of a levy of 5 per cent. on the taxable property of the county was asked. This road was to be a link of the Santa Rosa and Petaluma road, which was to extend through Mendocino county to Humboldt Bay. The proposition was voted on at an election held July 29th.

On the Southern Pacific ground has been broken for the branch from a point two miles south of Gilroy to

stated that the Eastern Nevada (Elko to Hamilton) narrow gauge road will be built, the necessary consent of the Central Pacific and of the tax-payers having been obtained.

On July 26th, the first 20 miles of the Utah Southern R. R. had been let, and the track was laid as far as Little Cottonwood.

The Omaha Herald, of June 20th, announced the departure of a party of surveyors to locate a road from Evanston, Wyoming, north along the Bear River valley, then westerly along the Snake river to Helena and Virginia City, Montana, and thence to tap the Northern Pacific.

#### Colorado.

The Boulder Valley road was to be graded to Boulder Valley by the end of July. The Denver and Rio Grande is pushing rapidly, the delay in receiving the iron being the only drawback. This road is attracting very great attention on account of being of narrow gauge. From the Denver Tribune we learn of a new 3-foot gauge road, the Kansas Central, which is to run from Leavenworth, Kansas, to Denver.

According to the Central City Register, the matter of a road thither from Golden is rapidly assuming shape. The U. P. R. R. will build it if Gilpin county will vote bonds to the amount of \$250,000. Concerning several Colorado roads, the letters from W. H. M., which we have lately

SECTION OF MAMMOTH TREE.

Watsonville and Castroville. Commissioners have been appointed at Washington to examine the 20-mile section already completed.

A party of railroad men interested in the Atlantic and Pacific R. R. have gone over the line surveyed along the coast from this city southwards, and are reported favorably impressed with the project. They say that the road will be built if local assistance is given.

In the middle of June, work was recommenced on the San Joaquin Valley road, by building a bridge over the Tuolumne, at Modesto, and grading on towards the Merced river. The bridge with approaches is 1,320 feet long. Track was laid across the bridge on July 19, at which time 15 miles of road beyond the river were ready for the rails.

On the Stockton and Visalia road three or four hundred men were at work at last accounts. The Modesto News has said that the C. P. R. R. were to build a branch road from that town eastward towards the Sierra.

The Antioch Ledger has published a report of the surveyors of the proposed Antioch and Visalia R. R., which, the paper asserts, will be built with the aid of Eastern capital.

#### Nevada—Utah—Wyoming.

On the Virginia, Carson and Reno Railroad the final survey was finished, and grading commenced, at the beginning of July, at the Reno end. On the 18th, 400 yards of track were laid; and by the middle of October the road is to be in running order from Reno to Steamboat Springs. A large force is at work on the bridge over the Truckee.

The Reno State Journal states "on good authority" that the narrow gauge road from that place to Virginia City will yet be built. A narrow gauge from Reno, via Carson, to the Cerro Gordo mines, and one from Reno via Beckworth's Pass to Plumas county, Cal., are proposed. It is

published, give very considerable information.

### The Mammoth Trees of California.\*

Tell a Bostonian that, if he will build an addition on top of his cherished Bunker Hill monument, so as to increase the height of this structure about one-half, he will get an edifice as tall as some of our Big Trees,—tell him this and he will consider you an excellent joker and much given to stories which ought, according to an old-time and popular saying, to be reserved "for the marines." Yet one would be sufficiently near the truth in making such a statement, which, moreover, would give people at the "Hub" some adequate idea of the height of the giants of our coast.

To give a real perception of these monoliths is a difficult task. We have given in private letters to our friends the various dimensions without producing any visible impressions. The last time we were at the Calaveras Grove, we adopted the suggestion of a friend, which resulted more successfully. We passed a thread, as high up as we could reach, around the trunks of some of the trees standing, cut it off just the circumference obtained, and sent the lengths to a few Eastern curiosity-collectors of our acquaintance, giving the facts. These people laid out the threads in as near a circle as practicable and thus obtained an idea of the size of the trunks. Knowing our undoubted veracity, they could not but be astonished.

For the benefit of our readers, to whom we can send no such evidences, we give today a representation of a section of a mam-

moth tree in the Calaveras Grove. The human figures will give some idea of the relative size of the monster.

The Calaveras and Mariposa groves are the best known to tourists. The latter has one tree, the Grizzly Giant, which surpasses in many respects any which we have seen. The Calaveras grove is, however, perhaps the more enjoyable. The excellent hotel of Messrs. Perry & Sperry (we do not care to puff such things generally, but every one praises this) is situated directly at the grove, so that one can enjoy the grove at leisure. Here are said to be 103 trees of goodly size, twenty of which are about 75 feet in circumference, in a comparatively small area. We shall not give many statistics, for we find that figures alone carry too little idea of the reality. Suffice it to say, merely, that the now fallen "Father of the Forest" is estimated to have been at least four hundred and thirty-five feet high.

There is another grove—the south grove—about six miles off, which is said to be larger than the one near the hotel.

California has a number of such groves, the most definite statements of which are to be found in the publications of our State Geological Survey. Our impression is, that a grove in Tulare county is said to have the finest trees. Space forbids our enlarging on the topic, to which, however, we may recur hereafter.

\*Our illustration is from the Scenes and Wonders of California, by J. M. Hutchings. A. Roman & Co., Publishers, San Francisco.

### A Great Orchard.

A few days ago it was our pleasure to visit the orchard of John Briggs, located about two miles south of Yuba City, in Sutter county. The proprietor is the owner of 426 acres, mostly bottom land, lying along the west bank of the Feather river. The soil is a rich, sandy loam, and composed of the yearly deposits of the river many years ago. Before reaching the orchard proper, we rode through a field of 150 acres of castor beans, which field is to give place to a new orchard next year, the fruit trees for the same at present growing in a nursery containing 25,000 one-year-old huddled peach trees, 16,000 plum trees, 6,000 Eastern walnuts, 25,000 California walnuts, 2,000 apple trees, 500 Italian chestnut trees, etc. Passing along through this, we arrived at the present peach orchard, consisting of 600 trees, two years old, and some of them bearing this season 150 pounds of peaches. These trees have made a remarkable growth, owing to the rich ground upon which they are planted, and in another year will make a tremendous yield of fruit. Passing the peach orchard, we reached the apricots, 2,200 in number, which are also two years old, and have borne a fair crop the present season. We next rode into the cherry orchard, containing 3,000 of most thrifty young trees. The different varieties, 15 in number, gave this orchard a variety of aspect. These cherry trees were all imported from Rochester, N. Y., about three years ago. Off to the south of this wonderful wilderness are 2,500 plum trees of twelve varieties, and 500 apple trees, mostly of winter varieties. On returning from the orchard by the wagon road we had entered, we visited Briggs Brothers' steam power castor oil mill. Here we found a magnificent hydraulic press, with 80 pound pressure, and possessing a capacity of compressing 300 gallons of oil per day. The mill also contained 20 tons of castor beans, and 2,500 gallons of oil ready for market.—Marysville Standard.

CALIFORNIA BUTTER IN NEW YORK.—A small arrival of California butter in New York, a short time ago produced quite a sensation among the Gothamites. The Tribune, in speaking of it, said:—"It was in two pound cylindrical rolls of fine grass color, waxy and high flavored, such as our State will produce one month from now. It has not been sold, but would readily command 50 cents per pound for its novelty, if not its real merits. Despite the disadvantages of climate, California is now making a quality of butter and cheese that will successfully compete with ours."

## New Publications.

**THE EYE IN HEALTH AND DISEASE;** a Series of Articles on the Anatomy and Physiology of the Human Eye, and its Surgical and Medical Treatment. By B. Joy Jeffries, A. M., M. D. Boston: Alexander Moore, Lee & Shepard. 1871. For Sale by A. Roman & Co., S. F.

With regard to the eye, there is but very little information possessed by the general public. Our sight is used with so little consciousness that we do not realize its importance and value till it is impaired or lost. Yet the care of the eye is all important, and with this the old proverb especially holds true, that an ounce of preventive is worth a pound of cure. We can therefore warmly recommend this publication, written by a medical man of high authority, to the public. To a very great number, the articles on old sight and spectacles, and on near-sightedness will prove especially valuable and applicable. The book is well written and fully illustrated.

**THE ILLUSTRATED HORSE MANAGEMENT,** containing descriptive remarks upon Anatomy, Medicine, Shoeing, Teething, Food, Vices, Stables; likewise a plain account of the Situation, Nature and Value of the various Points, together with comments on Grooms, Dealers, Breeders, and Trainers; also on Carriages and Harness. With over 400 engravings. By Edward Mayhew, M. R. C. V. S. Philadelphia: J. B. Lippincott & Co. For sale by Dewey & Co., S. F.

We have before spoken highly of the works of Mr. Mayhew (as his "Illustrated Horse Doctor"). This book forms a valuable addition to previous publications. The work is founded simply on common sense applied to the statements made and the facts known concerning the horse. It is written, moreover, in a manner easily comprehended by those styling themselves "practical" men; for its object is to reach those persons actually engaged about horses, and not for more theoretical reading. If the work runs counter to some notions entertained by many, it explains and proves its statements. As a teacher, therefore, it occupies a high position.

**THE ROADMASTER'S ASSISTANT AND SECTION-MASTER'S GUIDE;** a manual of Reference for all having to do with the Permanent Way of American Railroads, and containing the best results of experience and minute directions for Track-laying, Ballasting and Keeping the Track in Good Repair. By W. S. Huntington, Railroad Gazette Series. Chicago: A. N. Kellogg. 1871.

The object of this volume is to "correct, as far as possible, certain erroneous practices into which track-layers and section-men have fallen, which practices are fatal to the life of track and rolling stock." Those who have read the columns of our able cotemporary, the *Chicago Railroad Gazette*, will be familiar with the style of Mr. Huntington's writings, which have always struck us as of great value. So this volume, emanating from a wide experience on some of the best, and also some of the worst, managed roads in the country, contains very much of the greatest interest to those for whom it is written. We might call it a book of useful hints, were it not for the fact that "hints" hardly expresses the right worth of the practical facts mentioned. Our trackmen have to a great extent adhered to methods which, although good for the circumstances under which they were introduced, are wrong under new circumstances which have since arisen. The *why* and *wherefore* are shown here in a most convenient form, and the work is one to be recommended to practical men.

**A GENERAL TREATISE ON THE MANUFACTURE OF VINEGAR:** Theoretical and Practical, comprising the Chemical Principles Involved in the Preparation of Acetic Acid and its Derivatives, and the Practical Details of the Various Methods of Preparing Vinegar by the Slow and the Quick Processes, with Alcohol, Wine, Grain, Malt, Cider, Molasses, Beets, etc.; as well as the Fabrication of Pyroxylic Acid, Wood Vinegar, etc., etc.; together with their Applications, and a Treatise on Acetometry. By H. Dussane, sometime of the Laboratories of the French Government; author of "A General Treatise on the Manufacture of Soap," "A Complete Treatise on the Manufacture of Leather Dressing," etc., etc. With Illustrations and Philadelphia: Henry Carey Baird. London: Sampson Low, Son & Marston. 1871. 8vo. pp. 392. Price \$5. Sent free of postage to any part of the U. S.

The manufacture of vinegar has made most important progress of late years, and especially in this country during the late war, when manufacturers were obliged to have recourse to different materials (in part) from what were before used, and its production has, by the aid of science, been greatly cheapened. The above work, which is gotten up in excellent style, gives a full account of the progress of the industry and its present condition. Mr. Baird, in its preparation, has not hesitated to call to his assistance the best chemical talent of the country, and has turned out a work which, besides its own great intrinsic value, is highly creditable to the publisher.

**TIME AND ETERNITY.** A Poem. By George Mac-Henry. San Francisco: A. L. Bancroft & Co. 1871.

The typographical execution of this work is certainly most excellent. The printing and binding were all done at Bancroft's establishment, and we have never seen a finer specimen than this on our coast. The "poem" itself, however, is beyond us. So far as our limited perceptions go, it is principally a string of heavy words. Such verses as this, "Whence couriers ministrant succinct appear," meet us on every other page. Some people may like this sort of thing, but we are not up to it.

## Bull Run District, Nevada.

## New Strikes.

**EDS. PRESS.**—Since I last wrote, several new strikes have been made here. One was made by the McShane Co., and in this way: While running a tunnel to cut their ledge, they struck a body of decomposed red quartz. This was thrown aside on the dump as waste, until, some time after, they took a notion to have it assayed. The result was \$119 gold and \$57.50 silver per ton. After this test had been made, Mr. Smith discovered a ledge of similar character which, I hear, is much richer in gold; and others have since been found. As our district contains many different kinds of rocks, and numerous minerals, the miner here should always have tests made of any rock with which he is unacquainted, as several very valuable ledges have been discovered in this way.

## Mining Developments.

Our principal mines are all looking well, and every foot of depth shows improvement. The Ontario is sinking a shaft on the ledge and is in fine ore. The Franklin is also sinking and has just struck a very rich deposit. The Revenue is taking out high grade rock from the vein which is 4 feet wide. The Johnson shows a rich body of ore for 700 feet at the surface and as far down as has been gone. A tunnel is to be run to cut the bottom of the incline. The Blue Jacket takes out 15 tons daily. They have a 20-foot breast of good rock. This mine alone could furnish a mill with 36 tons daily. The Monument is still running its tunnel. The Highland Queen and other smaller claims are being worked with good success, I believe.

There is not much going on at Pennsylvania Hill. Some two or three companies, however, are at work, one of which is the Galena which is showing some very good ore.

## Arastra—Mills.

I understand that Mr. Borrett is about to erect an arastra. He has two stamps which he will set up for crushing the rock, and then will build an oven for roasting, after which he will amalgamate in the arastra which will be driven by water power. He says that he can thus work from 1 to 1½ tons every 24 hours at a small expense. If miners here would take hold of some such thing, it might help them in developing their mines until mills are erected.

As to bringing mills here, the millmen appear to demand that we contract to furnish 5,000 tons of ore and pay \$40 to \$50 per ton for working. Such a contract we shall make with no one. Our district justifies the erection of mills and has long done so, but we will not pay exorbitant prices for them. There is not another district in the State with an equal amount of ore but what has from 2 to 10 mills.

## BULL RUN MINER.

Bull Run Diet., July 13.

## Thimble Skein Wagons.

**EDITORS PRESS.**—In the issue of the PRESS of July 29th, I saw an inquiry concerning thimble skeins and thimble skein wagons. With regard to the different make and the difference in the run of the thimble skein and the wrought-iron axle, my experience has been in axling heavy freight wagons, for the last twenty years, in favor of the large axle. It overcomes the resistance of obstructions easier than smaller axles. With regard to the difference in the construction of thimble skeins, the Soule's thimble I consider is far superior to any other. They are got up upon more truly scientific principles than any other in use. They are so constructed that the axle can be made on a straight line, on the button, and give a plumb spoke, which is very necessary. They are also made without a chamber in the box, which is a plan adopted by the most experienced axle makers in the United States.

SUBSCRIBER.

## GOOD HEALTH.

## Dangers of the New Narcotic—Choral.

There is danger that not a little harm may result from the free use of the new narcotic, or anesthetic chloral. That it has valuable medicinal properties, and it is an admirable sedative, there can be no doubt. But it is one of the most fascinating of narcotics, and the habitual use of it is said to be attended with more and greater evils than almost any other drug of common consumption. It is understood, says the Boston *Advertiser*, that the use of it has become alarmingly prevalent; and it may therefore be well to note a few of the consequences. Eminent physicians say that it aggravates rheumatism and skin diseases, and causes irritation of the mucous surfaces of the nose and throat. It causes a dimness of sight that is most inconvenient, to say the least. A Chicago clergyman lately told his experience with the drug to his physician. For a few nights it was taken for sleeplessness; its effects were very pleasant; then came on a peculiar dimness, or weakness of sight; he had to read with one eye at a time—for a minute or two with each. If one eye was used longer than a minute, the words and letters became blurred and indistinct. The eyes became congested, the lids swollen and partially paralyzed. The tongue had a peculiar appearance; a black streak, like that caused by ink, extended the whole length of the tongue, in its center. The physician who sends this account to the *Chicago Tribune*, says that this peculiar appearance of the tongue is diagnostic. He had observed it in those who have been addicted to chloral eating for only a few days. The habit is, moreover, exceedingly hard to break off, and attempts to do so have resulted in symptoms not unlike those of delirium tremens. One case is reported where a man who took an overdose slept for twenty-four hours, and on awakening found his arms and legs paralyzed. It is to be hoped that these facts will induce the public generally to be very cautious about the new drug, and not to make use of it at all without the advice of a good physician.

## Living too Fast.

The deadliest foe to a man's longevity is unnatural and unreasonable excitement. Every man is born with a certain stock of vitality, which cannot be increased, but may be husbanded or expended rapidly, as he deems best. Within certain limits he has his choice to live fast or slow, to live abstemiously or intensely, to draw his little amount of life over a large space, or condense it into a narrow one; but when his stock is exhausted he has no more. He who lives abstemiously, who avoids all stimulants, takes light exercise, never overtasks himself, indulges no exhausting passions, feeds his mind and heart on no exciting material, has no debilitating pleasures, lets nothing ruffle his temper, keeps his accounts with God and man duly squared up, is sure, barring accidents, to spin out his life to the longest limit which it is possible to attain; while he who lives intensely, who feeds on high-seasoned food, whether material or mental, fatigues his body or brain by hard labor, exposes himself to inflammatory diseases, seeks continual excitement, gives loose reign to his passions, frets at every trouble and enjoys little repose, is burning the candle at both ends, and is sure to shorten his days.—*Ec.*

## Picking the Ears.

Dr. Hall says "picking the ear" is a most mischievous practice. In attempting to do this with hard substances, an unlucky motion has many a time pierced the drum; nothing sharper or harder than the end of the little finger, with the nail pared, ought ever to be introduced into the ear, unless by a physician. Persons are often seen endeavoring to remove the "wax" of the ear with the head of a pin; this ought never to be done; first, because it not only endangers the rupture of the ear by being pushed too far in, but if not so far, it may grate against the drum, excite inflammation, and an ulcer which will finally eat all the parts away, especially if of a scrofulous constitution; second, hard substances have often slipped in and caused the necessity of painful operations to fish or cut out; third, the wax is manufactured by nature to guard the entrance from dust, insects, and unmodified cold air, and when it has subserved its purpose, becomes dry, scaly, light, and in this condition is easily pushed outside by new formation of wax within.

Occasionally wax may harden and may interfere with the hearing; but when this is the case, it is the part of wisdom to consult a physician and let him decide what is the remedy; if one cannot be had, the only safe plan is to let fall into the ear three or four drops of tepid water, night and morning; the saliva is better still, for it is softer and more penetrating, but glycerine is far preferable to either; it is one of the blandest fluids in nature, and very rapidly penetrates the hardened wax, cools the parts, and restores them to a healthful condition. If in a week there is not a decided improvement in the hearing, medical advice ought to be had at once, as next to the eye, the ear is the most delicate organ of the body.

## How to Grow Lean.

Fat people will be interested to know that Dr. David, of Paris, a "professional emaciator," prescribes a treatment which is intended to diminish *embonpoint* without injuring the health. He directs the patient to live principally on meat, eating little else, and drinking as little as possible. Vegetables, soups, puddings, tarts, fruits, bread, cakes in their protean forms, have carbon and oxygen for their principal bases, and water is the protoxide of hydrogen; all of which substances are the elements of fat. The principal base of meat is azote or nitrogen, which does not enter into the composition of fat, hence lean meat is a good diet for the aspirant after leanness. Carnivorous animals are never corpulent, and pigs are fattened by meal, vegetables and milk, rather than with meat. The smallest possible quantity of liquid is an indispensable condition. It is said that a harrier who was at first so fat that he could not walk or lie down, was enabled to lose forty pounds in three months, and to diminish his abdominal girth by forty centimetres. The treatment prescribed for him was a beefsteak or cutlet, a cup of coffee and a very small quantity of vegetables; for dinner, plenty of meat, and little else; and a bottle or a bottle and a half of liquid per day.

**CHILDREN.**—When a child is hurt, never hush it. It is inexcusable barbarity; it is repressing his instinct, and for this reason if physical punishment is inflicted on a child it is perfect brutality. Cases are on record where children have been thrown into convulsions in their efforts to silence. A thousand times better is it to soothe by kindly words and acts, divert the mind by telling stories, by explaining pictures or by providing it with new toys. We have many a time in our professional experience as to sick children, found more benefit to be derived from a beautiful or interesting toy than from a dose of physic. The greatest humanity a mother can exhibit in respect to her sick child is to divert it, *divert it*, *divert it*, in all pleasing ways possible, as we ourselves who are larger children, feel sometimes really sick, when a cheerful face and much-loved friend has come in and before we know it we have forgotten what was the matter with us.—*Hall's Jour. of Health.*

**THE POISONOUS QUALITY IN RED FLANNEL.**—After a series of careful physiological and chemical experiments, by Dr. P. De Marmon, of Kingsbridge, N. Y., communicated by him to the *Medical World*, it was very definitely determined that the cause of poisoning by some red flannel was not in the coralline or aniline dyes, as generally supposed; but in a tin mordant used to fix the color upon the goods. The symptoms produced in the case to which his attention was called, were an eruption, with severe itching accompanied with vertigo. The woman who washed the garment had her arms up to the elbow covered with a red, burning eruption, similar in appearance and feeling to scarlet fever.

**EUCALYPTUS CIGARS** are being employed by French physicians for diseases of the larynx. It is also proposed that they be employed instead of tobacco by persons to whom that narcotic is particularly injurious. They are made from the leaves, which contains a kind of camphor, peculiar to that tree, and which constitutes their peculiar medicinal value. It is said they have been used with success in cases of asthma. Two or three leaves burned in a room produce an odor which is very soothing to the patient.

Hemlock a Rat-Proof Wood; Tomatoes; Making Cheese; Measure for Shoes, Ill.; Mechanical Hints; etc.....	74

## A New Water Meter.

We are informed that a new water meter and engine is soon to be introduced on this coast. There is a very great chance for an improved device of the kind, and we are assured by persons conversant with the subject that this apparatus is an improvement on former designs. It can be used as a water meter, and also as power for running sewing machines, as well as for heavier work.

We have not yet seen the machine, nor have we received a full description of it. We have only heard the above statements from well-informed people. But the matter is worth looking at, and we shall investigate it further. Messrs. Macondray & Co., 206 Sansome street, will soon be able to give definite information.

## CHERRIES—WONDERFUL PRODUCTION.

We have received through Chas. F. Wilkinson, Esq. of the Deaf and Dumb Institute of Oakland, a remarkable display of cherries, grown in the nursery of Mr. Seth Luelling on the Willamette river, near Milwaukie, Oregon. This display consisted of 354 cherries, of the Royal Ann variety, grown on a single stem of seven-eighths of an inch diameter and five feet long; the whole weighing seven pounds.

We have had this remarkable product photographed, and shall have it engraved for illustration in the Press. After a short exhibition of the stem entire at Steele's drug store on Montgomery st., in order to preserve so remarkable a specimen as well as possible, it has been cut into short lengths and preserved in alcohol, in which condition it will be exhibited at the coming Fair of the Mechanics' Institute.

MAP OF UTAH MINES.—Our correspondent, W. H. M., now in Utah, has had a map of some of the principal mining camps drawn by a gentleman of high standing there; and this will be published by us with his communications from that place.

## The Commission to Japan.

We received last Saturday a call from Gen. Horace Capron, formerly U. S. Commissioner of Agriculture, and now at the head of the Commission appointed by the Japanese Government to investigate the resources of the empire.

The Commission will pay attention to the developing of the various branches of industry, agriculture, mining and manufacturing. The introduction of railways will also be an important part of their work. In the beginning, the principal work will be the introduction of improved methods of agriculture, and examination of the great mineral wealth of the country and of routes for railways.

Gen. Capron brings to the task many excellent qualities. His position as Commissioner of Agriculture has shown him to be not only of good scientific calibre, but also prominent as a financial manager. During the four years in which he has held this place, he has not only cleared off the debt of some \$60,000 which the department had previously incurred, but has also brought up the standard to a high level, has introduced and carried out many important projects, has added greatly to the scope and usefulness of the department, and now leaves it with the present appropriation of the year intact. A better record than this, no one could desire. Again, the General's wide experience as a large manufacturer and also as a prominent public man, has given him a knowledge of men, and a degree of tact invaluable in such a work.

Gen. Capron is aided by an efficient staff. Prof. Thomas Antisell, formerly of the University of Michigan, is a chemist of the first order, and well qualified as a mineralogist and geologist. Maj. A. G. Warfield, Jr., of Baltimore, Md., is commended highly as a railroad engineer, and especially as a good locator of roads. The Secretary of the Commission, Dr. Stuart Eldridge, of Washington, is also well spoken of for his literary and scientific attainments.

The General has a grave task before him, and one which will present many obstacles. He recognizes the fact and makes no parade of what he is to accomplish. We are all interested in his success, as a matter of national pride. We give him all our best wishes, and the hope that success may crown his efforts.

## Fine Art in San Francisco.

The very pleasant Art Gallery of Messrs. Snow and Roos was opened to the press on Friday of last week, and then to the general public. It has been nicely refitted and now contains in all about a hundred and fifty or sixty paintings.

The chief attraction of the Gallery is, of course, Bierstadt's "Emerald Pool," a scene in the White mountains. This is most exquisitely painted, and has called out the strongest encomiums from the papers. A number of local artists are represented in the collection, and a large piece of fine mosaic work attracts considerable attention. The gallery is open day and evening.

TERRIBLE BOILER EXPLOSION.—Telegrams from New York inform us that a Staten Island ferry boat exploded her boiler, on July 30th, when 200 people were on board. The result was 57 persons killed and 120 wounded, besides damage to the vessel to the amount of some \$12,000. The evidence given points to gross negligence on the part of those whose duty it is to examine and care for the boilers. A rigid examination is promised. If the fault can be traced directly to any one, he should suffer the extreme penalties of the law. Hanging is unfortunately not legal, although none too severe a punishment for wholesale murder and mutilation. Later accounts gives the number killed as 72.

## Mechanics' Fair.

The Fair at the Mechanics' Institute, which will open August 8th, promises to far outshine any previous effort. The list of articles to be exhibited is already extended far beyond what it has been at any previous fair. They are divided into thirty-six different classes, as follows:

- Class 1—Raw materials.
- Class 2—Vegetables.
- Class 3—Stuffed Animals, etc.
- Class 4—Steam Boilers, generators and appurtenances.
- Class 5—Steam Engines and appurtenances of all kinds.
- Class 6—Machines for transmission of power, etc.
- Class 7—Machinery and appliances employed in manufacturing and producing.
- Class 8—Metal-working, etc.
- Class 9—Wood-working.
- Class 10—Agricultural implements.
- Class 11—Machinery of various manufactures.
- Class 12—Philosophical, dental and surgical machines, etc.
- Class 13—Manufactures in metals.
- Class 14—Manufactures in wood.
- Class 15—Manufactures in glass, etc.
- Class 16—Manufactures in leather, rubber, etc.
- Class 17—Manufactures of wool, cotton and silk.
- Class 18—Manufactures from fibres and pulp.
- Class 19—Various manufactures.
- Class 20—Engineering and architecture.
- Class 21—Military engineering and architecture.
- Class 22—Civil engineering and architecture.
- Class 23—Will include paintings in oil and water-colors, chromos, crayons and pencil drawing, as distinguished from architectural drawing. A large number of works of art have been entered.
- Class 24—Sculptures, etc.
- Class 25—Various.
- Class 26—Lithographs, photographs, etc.
- Class 27—Wax-work and other light articles of taste.
- Class 28—Specimens of printing, etc.
- Class 29—Stationery, etc.
- Class 30—Sign-painting, lettering, ornamentation, etc.
- Class 31—Musical instruments.
- Class 32—Millinery, dressmaking, etc.
- Class 33—Chemical processes and products.
- Class 34—Processes and products of domestic economy.
- Class 35—Fermented cereals and vinous products.
- Class 36—Chemical and pharmaceutical products.

## The Silk Factory in Operation.

The California Silk Manufactory, at South San Francisco, is now in the full tide of successful experiments. As soon as the machinery now on hand is adjusted about 50 hands will be employed; which number will be increased to about 100 as soon as the mill is filled with machinery to its fullest capacity. The superintendent is a gentleman who has had large experience in Europe, where he has worked raw silk from China, Japan, France and Italy. He says the native California silk is fully equal to any he has ever worked.

The reeling department is one which will for the present excite the most interest and attention from the public, as it is a branch of the business which it is proposed shall be transferred from the factory to the homes of our silk growers, all over the State.

The true plan of silk raising contemplates the production of the raw silk (reeled) by the producer—it properly has no place in the factory. In this department at the factory may now be seen two young girls, the one a native of Italy, in which country she became skilled in the labor of "reeling," the other is Miss Amelia Thomas, of this city—the first native Californian who learned to reel silk. She acquired her proficiency while at work for Mr. Neuman, and reeled a large portion of the silk from which the presentation flags manufactured by him were made.

Many silk growers from various parts of the State have already visited the factory

to satisfy themselves of the reality of the enterprise, and to witness its operations. The managers will extend every facility for the training of reelers, who may wish to engage in that occupation in immediate connection with the production of the cocoons. The company prefer to buy their raw silk rather than reel it themselves at the factory. No weaving will be done at the factory at present; but it is expected that as the business expands, the manufacture of fabrics will become a feature of the enterprise.

## Geological Survey of the 40th Parallel.

The long expected work of the U. S. geological survey expedition, under charge of Clarence King, has at last been published. Treating, as it does, of the most important mining belt which could be selected in any such general way,—the belt along the 40th parallel, extending through Nevada, Utah and Colorado—it contains very much of the greatest interest to the mining community.

We would state here, as we have received a large number of enquiries as to the possibility of obtaining the work, that only two thousand copies have been struck off, while five thousand applications have already been received by the U. S. Engineering Department, under whose auspices the work has been accomplished. There is, therefore, no possibility of getting the volume, which is only a part, by the way, of the series, being Volume III, on Mining. It is not a Congressional publication. But Congress ought to authorize the publication of large number of copies, which can easily be done as the book is stereotyped. We therefore advise all wishing to obtain a copy, to write to their proper Congressional representatives, urging that copies be printed and distributed.

We had intended to speak more fully on this report, but we are obliged to defer it. Accompanying the work is a most valuable atlas, containing excellent sections of the Comstock lode, geological and topographical maps of the mining districts, etc. There can be no doubt but what this is the finest work of the kind ever published in this country,—probably its superior in any place is yet to appear. Bearing directly on the great interest of the West, its value is very great, and we hope that Congress will have another edition issued.

WATER AND GAS PIPE.—At 338 Montgomery street, room 4, may be seen specimens of pipe made by the Washington Water and Gas Pipe Co. The general features of the manufacture are that good Oregon wood is preserved and fashioned into pipe of any required size, in 8-foot sections, then banded with iron to ensure great strength, and then coated with asphaltum. Thus is made a strong pipe, which is perfectly free from injurious substances which render lead and other metallic pipes objectionable. Every piece is tested by a pressure 25 per cent. above what it will be required to sustain in actual use. There can be no doubt but what such pipe is excellent for many purposes. The main objection hitherto has been the price. We are assured that the pipe can be furnished very cheap. It has been, in use in different places during the past eleven years, and gives, it is asserted, great satisfaction. By the preservation process, great durability is secured.

PROF. W. P. BLAKE writes us from Utah that he will soon be in this city in all probability. Quite a number of gentlemen from California and Nevada, as well as from other places, are now examining the mineral resources of Utah,—Senators Nye and Stewart, Messrs. Head, T. W. Park, James Selover and others. Moreover, Commissioner Raymond has been there, but has left for Montana.

A STRANDED WHALE.—A whale has been washed ashore on the beach about half a mile beyond Fort Point. He is said to be 90 feet long, and is now being prospected for oil.

## English Patent Law Reform.

At a meeting of patent agents, in London, held on July 4th, to consider the proposed changes in the patent laws, the following resolutions were adopted:

*First*—That the chief defects of the patent laws have arisen from a want of appreciation of the natural rights of inventors to the sole use of their inventions, an unreserved recognition of which rights must pervade every equitable patent system, and the true aim of patent legislation is to harmonize these individual rights with the material interests of the State.

*Second*—That the grant of patents to negro "first importers" is an injustice to inventors, an injury to society as it induces the "pirating" of inventions; and the reason for these grants no longer existing, legislation should confine the issue of patents to actual inventors and their representatives.

*Third*—That, in view of the benefits inventors confer on the public, and the expenses incident to the completion and introduction of new inventions, a patent for fourteen years is an inadequate compensation, and we deem it expedient to grant patents for a term of twenty-one years without the privilege of extension.

*Fourth*—That the patent laws impose penalties upon inventors in the form of excessive fees, which justice and public policy demand should be reduced to the amount requisite to defray the expenses of an efficient administration of a simple patent system, and fees of ten pounds for the entire term—now one hundred and seventy-five pounds—would yield more than sufficient for the purpose.

*Fifth*—That the defects of the present practice should be remedied by the adoption of equitable "regulations," and the introduction of the system of granting patents, at the risk of the applicants, without any official supervision of the specification or preliminary investigation of the merits of the invention.

*Sixth*—That the rights of patentees should be determined by a competent tribunal, excluding all technical objections to the validity of the patent, and we deem it expedient to dispense with jurors and "scientific experts" in patent suits.

It was also ordered that the above resolutions be forwarded to the Parliamentary "Select Committee on Letters Patent," and it is to be hoped that favorable action will be secured on the propositions presented. The British Patent Law, as it now stands, is a terror to actual inventors outside of that country, and even refuses protection to home inventors, who delay making their application until after some patent sharp has slyly slipped in ahead of them. It offers every inducement and even favors the pirating of foreign inventions to such an extent that a citizen of any other country dare not issue or make public his invention without first securing his patent in Great Britain. This thing should not be. The law should protect and reward the genius who, through his own skill and labor, produces an invention of value to his fellow man. Without this protection, the progressive and inventive minds will refuse to work. The amount of fees also required to secure British protection is another hardship to inventors who, as a general rule, are not overburdened with money. This fact, in connection with the one above mentioned, gives the wealthy class a great advantage over the poor genius who has struggled with poverty in producing a valuable invention. We hope that the above or a similar reform will be instituted in Great Britain, so that the real and true inventor; and he only, shall be qualified to receive protection in the same manner as is provided for in the United States.

**LAKE TAHOE WATER CO.**—It is stated that the injunction suits against Col. Von Schmidt's work have been amicably arranged. The tunneling of the Sierra is soon to be commenced. Meantime work on the Alta Water Company's work, at the head of the American River, will be going on, and Col. Von Schmidt promises that from this source he will be prepared to furnish miners and others as low down as Iowa Hill with water within twelve months from date.

## Safety Catch for Mining Cages.

The necessity of having safety catches on cages in mines, especially when used for the ascent or descent of the workmen, has long been most ungently felt, so that, in some countries, it is required by law that some good device of the kind shall be used. Several instances have occurred of late at the Comstock mines which have shown the great value of safety cages, and these evidences can be reduplicated in almost any place where there are deep shafts.

Mr. Timothy Stebins, of this city, has devised a simple arrangement for a safety catch which will be readily understood from the accompanying illustration. Here *A, A*, are the guide timbers; *B* is the upper cross-bar of the frame of the cage; *C, C*

STEBINS' SAFETY CATCH FOR MINING CAGES.

are levers, bent at the upper ends, as shown at *O*. The inner ends of the levers pass one another a short distance so that the link to which the hoisting rope is attached acts at once on both levers. *D* is a stout flat spring which tends to throw the inner ends of the levers away from *B*, that is, to

PATENT NOSE FEED-BUCKET.

clamp the ends, *O*, firmly against the guide-timbers, *A*, so as to prevent the cage from moving. When the cage is being hoisted, or lowered, its weight prevents the spring, *D*, from acting on the levers; but if the rope breaks, the spring is released and causes the catches, *O*, to grip the guides with their upper edges and hold the cage. The device is very simple, and can be made and adapted to cages at a very small expense.

Patent Nose Feed-Bucket.

We were shown, in New York, by the inventor, Mr. W. A. Hough, of South Butler, Wayne Co., N. Y., what seemed to us a very desirable improvement in this class of article. The accompanying drawing, made from memory, serves to show its main principles. To the main bucket, *A*, are attached bags or pockets, *B, B*, into which is put the feed. At *C, C*, are left openings through which the feed finds its way into the main compartment, *A*, as fast

as the animal eats, and no faster, for as soon as the grain has filled *A* to a certain height, it acts as a gate and stops the supply entering through *C, C*, until the horse has lowered its level again. There is a wire stiffening as denoted by *D, D*. The article is cheaply constructed and will last a long time, as the animal does not thrash it about in order to get the food from the bottom, as is the case with ordinary feed-buckets. It is an advantage to the animal as well as to the owner of the article.

## Stebins' Improved Friction Clutch.

This invention is a new form of friction clutch, such as is used for hoisting pulleys and in other such cases where it is necessary that the pulley shall revolve freely in one direction, and lock itself when power

is applied to move it in the contrary direction.

In this form, there is a disk, *A*, provided with a rim as shown in the engraving, so as to form a hollow pulley. Through the center of this disk revolves a shaft to which is attached a hub with sets of arms, *D, d*, of the shapes denoted in the engraving. Between the two arms of a set is a bar, *C*, of the general shape shown, which is kept pressed gently against the rim of the pulley by means of springs. The arrangement is such that when the shaft revolves

STEBINS' FRICTION CLUTCH.

in one direction, the bars, *C*, rest against the arms, *D*, so that the outer edge of the bars is concentric with the rim of the pulley and consequently motion is unimpeded; but on reversing the motion, the small arms, *d*, thrust the bar out of its radial position, and the edge hinders against the rim so as to prevent motion. For the sake of illustration, the engraving shows one bar in the position it assumes to allow motion, and the other in a position to lock the pulley.

A patent for this invention has been granted, under date of June 7, 1870, through the SCIENTIFIC PRESS Patent Agency, to Mr. Timothy Stebins, San Francisco, Cal.

MR. W. H. WEBB, who has recently inaugurated the New Zealand and Australian steamship line on a sound basis, left San Francisco for New York, this week. Previous to his departure he received a most flattering address from the prominent merchants of this city.

## Laying Fumes of Giant Powder.

The following are the specification and claims for an improved method of laying fumes of giant powder, invented by Dr. Amrose Blatchly, of San Francisco, Cal., for which a patent has been granted through this office.

My invention relates to a process or method of laying or dispersing the deleterious fumes or gases which are evolved by Giant, Hercules powder and other explosive compounds which are composed of nitro-glycerine as a base.

It is a well known fact that where any of these explosive compounds are used in tunnels for blasting, and especially in the mines of California, the nitrous acid which is evolved by the explosive will linger in the atmosphere for a considerable time after the blast has been made, and the workmen are therefore compelled to inhale into the lungs air saturated with it.

The consequence of this inhalation of the fumes is that nausea, sickness and emaciation result to the workmen to such an extent that the use of these explosives in many tunnels has been discontinued from the fact that laborers refused to work where it was employed, thus compelling the disuse of the most economical and valuable blasting agents known.

In order to avoid this trouble and totally suppress these fumes, I employ a spray or jet of water immediately after each explosion, which I eject into the air in the immediate neighborhood of the blast, and which, on account of its great affinity for the gas evolved, will absorb it and precipitate it to the bottom of the tunnel with immediate results.

After this treatment, the workmen can immediately resume work without inconvenience, thus practically obviating all trouble in connection with the use of this class of explosives, and accomplishing a result which is of great value to the miners.

For delivering the spray of water into the mine, any suitable nozzle provided with a sprinkler will suffice.

Having thus described my invention, what I claim and desire to secure by Letters Patent is:

The above described method for laying or precipitating the gas or fumes evolved by explosives which are composed of nitro-glycerine as a base, substantially as specified.

## A New Sort of Incorporation.

There has been filed in the office of the Clerk of Alameda county a certificate of incorporation which reads rather queerly. The object is easily understood and is commendable, but the method of attaining it seems rather peculiar. The certificate is that of the Washington College Association; term of existence fifty years; object, to accumulate a fund to purchase real estate for a site, and to erect a college building and to organize and carry on a school to be known as the Washington College of Science and Industry, the same to be a fifth-class of the University of California and a chartered college of the State. Capital stock, \$30,000 divided into 600 shares. Principal place of business and location of the college, Washington, Alameda county. The trustees who are to manage the affairs of the corporation for the first three months are: E. L. Beard, W. F. B. Lynch, Albert Lyper, W. G. Homer, S. J. Marston, H. Croswell, G. Mowry, H. Curtner, and M. W. Dixon.

**FIRE IN FRESNO.**—The Fresno *Expositor* of July 20th, says: A damaging and disastrous fire has for several days past been raging in the mountains, between the Chowchilla and Fresno rivers. We are informed that it commenced on the Chowchilla river, near Chapman's ranch, and has burnt over a slope of country about nine miles in width clear to the Fresno river. Our informant tells us that parties were seen setting fire to the grass on the Chowchilla, but could not be recognized. The wildest cattle ran toward the men who were heating out the fire, seeming to seek protection, as they were driven out of the range. What amount of damage has been sustained, we did not learn. At last accounts the fire was still raging eastward toward the head of the Chowchilla river.

## DOMESTIC ECONOMY.

### Hemlock a Rat-Proof Wood.

If the following is reliable it should be more generally known. We find it copied into an exchange, without credit; so we are compelled to pass it along, if at all, in the same manner. It is well worth verification if possible. We copy as follows:

Being surrounded by rats, writes a correspondent, I found it necessary to keep fruits, butter, cheese, and other articles in boxes made of hemlock, not the *Covium* of the horologist, but the *Abies Canadensis* of the arborist. In these boxes I could keep the most toothsome delicacies in the cellar with impunity, even though the box afforded free ventilation, which, in many cases, is highly necessary. To test the matter still further, I made a box of dry hemlock boards perforating each end of the box with a 3/4-inch circular hole. Into this box I put a large healthy rat, caught in a hemispherical wire trap, nailed it up securely, put it in a dark quiet place, and awaited the result. On inspection at the end of 24 hours, I found he had scarcely more than touched the wood. I returned the box leaving the rat to his cogitations, which horn of the dilemma to choose. At the end of 48 hours I made him another visit. He had evidently come to the conclusion that remaining inactive was to strand upon Scylla, while the effort to huy his liberty could do no worse than wreck him upon Charybdis. He had enlarged the hole sufficiently to get his his head out, in which condition I found and dispatched him on the third morning of his incarceration.

### How to Cook Tomatoes.

The tomato is a vegetable that it is difficult to spoil, and it is generally acceptable even when rudely cooked. It is capable of so much change in the cooking as to afford a pleasing variety. One way of stewing tomatoes is to choose very ripe ones, skin and slice, rejecting any hard parts. Put in a pan with salt, butter and pepper, and very slightly cook, not more than ten minutes.

Another way is to stew tomatoes until thoroughly soft, rub them through a sieve and then cook them down to the desired thickness. Butter, salt and pepper, are the usual seasoning. Those fond of the flavor of onions will find the addition of chopped onions while cooking, to make an excellent variety. Baked tomatoes are fine; choose large fruit, and cut out a cavity at the stem end; fill this with a mixture of powdered crackers or bread crumbs, butter salt or other seasoning, set on a pan and bake until done. If managed carefully, the tomatoes retain their shape. Tomatoes may be broiled; cut them in halves cross wise and put them cut-side down upon the gridiron over the fire. When the cut surface is seared, turn them and put butter, salt, etc., on each, and cook with the skin side down until done.—*American Agriculturist*.

**AIR THE BEDDING.**—The desire of an energetic housekeeper to have her work completed at an early hour in the morning often causes her to leave one of the important items of neatness undone. The most effectual purifying of beds and bedclothes, cannot take place if a seasonable time is not allowed for the free circulation of pure air to remove all impurities which have collected during the hours of slumber. At least two or three hours should be allowed for the complete removal of atoms of insensible perspiration which are absorbed by the bed. Every day this airing should be done, and occasionally bedding, constantly used, should be carried into the open air, and when practical left exposed to the sun and wind for half a day.

**A NICE SUMMER DRINK.**—For the hot weather a delicious drink—soda cream—can be made in this wise: Two and a half ounces of tartaric acid, three pounds of white sugar, two quarts of water, white of three eggs, one teaspoonful of sassafras, lemon, vanilla, pineapple, or any flavoring essence one desires; put the acid, sugar and water together in a porcelain saucepan, and let it just come to a boil; add the whites of the eggs, beaten to a stiff froth; boil it just four minutes, stirring it every moment; strain; add the essences when cold; bottle tightly. When it is desired for use, turn two tablespoonfuls of it into half a tumbler of ice water, add to it one-third of a teaspoonful of soda, stir up and drink as soon as it foams. This makes a delicious drink, and is not expensive.

### A New Way of Making Cheese.

In conversation, recently, with an intelligent gentleman, one interested in all farm processes and practically familiar with many parts of farming, he related the manner of making, or rather pressing, cheese, practiced by a neighbor of his—a woman skilled in household economy and famous for her nice cheese. With the number of oows usually kept, it takes three days to make a cheese. Her former method was to run up a curd each morning, keeping them until the third day, then mixing old and new curds together, and putting them into the hoop and pressing. Her practice is now to run up the curd and put it into the press at once, the hoop being about one-third full. The next morning the second curd is run up, that which was in the hoop was taken out, the cloth changed, placed in the hoop again, the top of it then scratched or broken with a fork, and the second curd put in, when it is again placed in the press, where it remains all day. The third morning's curd is then run up, the cheese taken from the press, turned, the surface hacked up with a fork, and the third curd again sliced on, bringing the first curd in the middle of the cheese. It is then pressed sufficiently, taken out and placed in the curing-room. By this process the work each morning is cleared away, and a good sized cheese is produced of superior quality, and one as firm and solid as if all were placed in the hoop at once.—*Etc.*

It is often very convenient for a person on account of distance or sickness to have the measure of his or her foot taken by a friend and sent to the shoemakers instead

of going in person to be measured. By consulting the following diagram and directions this may readily be done:

**DIRECTIONS.**—First place the foot on a piece of paper and trace the outlines of the same with pencil, which will give the length and spread of the foot; then make the following measurements in inches, and fractions with tape. Measure as shown on diagram above:

1st, Ankle. 2d, Heel. 3d, Instep. 4th, Base, or Ball of the foot, or toes.

**Shoemaker's Measure.**—It may also be interesting with the above, to be made acquainted with the following facts in connection with the shoemaker's measure of sizes: No. 1 is 4 1/2 inches in length, and every additional number 1/4 of an inch more, but only for children's feet. For adults, No. 1 is 8 1/2 inches, and every additional number 1/4 of an inch more, so that No. 10 is 11 1/2 inches.

### A Russian Method of Preserving Fruit.

A method of preserving fruit, quite frequently adopted in Russia, consists in slacking fresh lime by sprinkling it with water and adding a little creosote. The fruit is to be packed in wooden boxes, with a layer of prepared chalk powder of an inch in depth at the bottom. This layer is to be first covered with a sheet of paper, and upon it the fruit is to be laid so as not to touch each other. On the first layer of fruit another sheet of paper is placed, with the lime-powder sprinkled over it, and a sheet of paper over this; upon this another layer of fruit is spread, as before, and the process continued until the box is full. The corners may then be filled with charcoal. If a tight cover is put on the box, the fruit, it is said, will maintain its sweetness for at least a year.

**BOILING ONIONS.**—A contemporary says, in boiling onions or cabbage, place a dish of vinegar on the stove at the same time. The fumes of the vinegar, which need not be made unpleasantly strong, will effectually destroy the odor of the vegetables.

### Domestic Receipts.

**To Cook EGG PLANT.**—Pare the fruit, cut it into slices a third of an inch thick, salt the pieces and stack them upon a plate. In an hour or two they will have parted with considerable water. They are then to be dipped in egg and sprinkled with cracker crumbs and fried. Serve very hot.

**To Cook VEGETABLE OYSTERS.**—A writer in an agricultural exchange says: "Our plan is, to wash them, scrape them, and slice them into cold water, so they will not turn black. When you are ready to cook them, put them into sufficient water to cover them; stew till soft, then add as much sweet milk as you like; season with salt and pepper; stir a tablespoonful of flour into as much butter as you need to season the dish; put it into the pan and let it boil up once, and it is ready to serve. Put in a slice of toast if you like."

**AN EXCELLENT AND ECONOMICAL PUDDING.** Pare and core half a dozen easily cooked apples, chop them into small bits; dry some bread in the oven—stale is the best—till it is crisp, then roll it into crumbs; butter a deep dish and place in it a layer of crumbs; then put in the apples, with a little sugar, and such spices as you like; cover the apples with another layer of crumbs, and so on, adding a little beef suet, chopped as finely as possible; pour in half a pint of milk; bake till nicely browned, and serve with hard sauce. Having many times made this pudding in our own family, we can speak advisedly of its excellence.—*German town Telegraph*.

**GRAHAM FLOUR MUFFINS.**—One pint of sour milk, a small teaspoonful of soda, one tablespoonful of sugar, Graham flour enough to make a thick batter. Bake in rings, or drop the batter in spoonfuls on a square tin. A little salt should be added to the batter before baking.

**BOILED CORN BREAD.**—Two cups of corn meal, one cup of wheat flour, half a cup of brown sugar, one pint of sour milk, one and a half teaspoons of soda, one teaspoon of salt; mix well. Put in a well-greased tin pail, cover tight and set in a kettle of boiling water; cover and boil two hours.

### Mechanical Hints.

**To STAIN IVORY OR BONE BLACK.**—Add to any quantity of nitrate of silver (lunar caustic), three times its bulk of water, and steep your ivory or bone in it; take it out again in about an hour, and expose it to the sunshine to dry, and it will be a perfect black.

**To STAIN IVORY OR BONE GREEN.**—Steep your work in a solution of verdigris and sal-ammoniac in weak aqua fortis, in the proportion of two parts of the former to one of the latter, being careful to use the precautions mentioned for staining red.

**To STAIN IVORY, ETC., BLUE.**—Stain your material green according to the previous process, and then dip them in a strong solution of pearl ash and water.

**To STAIN IVORY, ETC., YELLOW.**—Put your ivory in a strong solution of alum water, and keep the whole some time nearly boiling; then take them out and immerse them in a hot mixture of turmeric and water, either with or without the addition of French berries; let them simmer for about half an hour, and your ivory will be a beautiful yellow. Ivory or bone should dry very gradually, or it will split or crack.

**To SOFTEN IVORY.**—Slice a quarter of a pound of mandrake, and put in half a pint of the best vinegar, into which put your ivory; let it stand in a warm place for forty-eight hours, and you will then be able to bend the ivory to your mind.

**STAINS IN IVORY.**—There is no method of removing stains from ivory equal to hot lime wash; and on the finger-board of a piano, or organ, or harmonium, you can only do it with removing them. If ornamental work, be careful they do not split. The best way is to put them in hot water; then, when cold, place them in slack lime a little bit wet, and let them and the lime dry together slowly.

**WAX IMPRESSIONS.**—Saturate your plaster casts with boiled oil, dry thoroughly, and before putting in the mould damp the surface with olive oil, removing any excess with a bit of clean cotton wool. Do not raise the wax to a temperature much beyond the melting point, and pour steadily on one point, so that it will flow freely and evenly over the surface; these precautions will effectually prevent air bubbles on the surface you intend to deposit upon.

There are neither furniture manufacturers, nor manufacturers of musical instruments in the State of Texas.

## Life Thoughts.

GREATNESS of mind is always compassionate.

FEAR anticipates and magnifies future evils.

WISCONSIN is now the great iron producing State of the Union.

THE moment man gives way to inordinate desire, disquietude and torment take possession of his heart.

HEAVEN help the man who imagines he can dodge enemies by trying to please everybody.

A GOOD word is an easy obligation, but not to speak ill requires only silence, which costs us nothing.

TALENT, alone, is only the rough metal; it is diligent industry which works it, and ascertains its value.

MISFORTUNE, like a storm in traveling, gives zest for the sunshine, freshness to the prospect, and often introduces an agreeable companion for the remainder of the journey.

THE heart of a wise man should resemble a mirror, which reflects every object without being sullied by any.

VIRTUE has this happiness, that she can subsist of herself, and knows how to exist with admirers, partizans and protectors.

WHATEVER is done by those around you, be yourself fully determined to walk in the most excellent way.

EXPERIENCE teaches, it is true, but she never teaches in time. Each event brings its lesson, and the lesson is remembered; but the same event never occurs again.

### Influence of Example.

Men's lives are pages of history. Those who read are stimulated to good deeds thereby, or taught to avoid the mistakes such lives record. There cannot be too much said, or written, to encourage men of wealth to devote their leisure and money towards developing the beautiful in Nature, recovering and regenerating waste places, and affording men with less means and opportunities for the study of rural art. The influence of an example of good taste in the adornment of a single place in a neighborhood or town, reaches far into the future and molds more than most men think, the external features of that neighborhood or town, and affects more ultimately the lives of those whom it influences. If one man plants a tree his neighbor wants one. If one housewife has a flower parterre, another is not insensible to the enthusiasm with which the first exhibits and praises her floral pets. If one man sees his neighbor clearing out an old swamp, a ravine, or a rough place of any sort, and converting its rude angularities into symmetrical lines of beauty, he ever after looks upon the rough places of his own domain with the possibilities of what it may become in his mind's eye, and realizes, sooner or later, the ideal beauty which the realization of his neighbors have established.

SHUN EVIL SPEAKERS.—Deal tenderly with the absent; say nothing to inflict a wound on their reputation. They may be wrong and wicked, yet your knowledge of it does not oblige you to disclose their character, except to save others from injury. Then do it in a way that hespeaks a spirit of kindness to the absent offender. Be not hasty to credit evil reports. They are often the result of misunderstanding, or evil design, or they proceed from an exaggerated or partial disclosure of facts. Wait and learn the whole history before you decide; then believe what evidence compels you to, and no more. But, even then, take heed not to indulge the least unkindness, else you dissipate all the spirit of your prayer for them, and unreserve yourself for doing them good.

AMERICA has caught the glorious infection of free individual thought, which is going down to the bottom of all institutions, that it may see whether the foundations be well and justly laid: and woe unto the edifice that rests upon prejudice and bigotry.

EVERY man builds his own house—builds it many-chambered, fresh-ventilated, picture-hung, vine-wreathed, guest-full; or low-peut, bare-walled, flowerless, inhospitable—just in accordance with his inner nature.

It is the highest duty, privilege and pleasure, for great men to earn what they possess, to work their own way through life, to be the architects of their own fortunes.

UNION PACIFIC RAILROAD.

Running from Ogden, Utah, to Omaha, Nebraska—over  
one thousand miles. Making  
**DIRECT CONNECTIONS**  
AT OGDEN with the CENTRAL PACIFIC R. R. (from San  
Francisco); also with the Utah Central R. R. to Salt Lake  
City.  
AT CHEYENNE with the DENVER PACIFIC R. R., with  
connection at Denver City with the Kansas Pacific R. R. to  
St. Louis and Southern and Atlantic Cities.  
AT OMAHA, for Chicago, Eastern and other cities, with  
the Chicago and Northwestern; Chicago, Rock Island and  
Pacific; Burlington and Missouri River; St. Joseph and  
Council Bluffs Railroads.  
**EXPRESS TRAINS RUN DAILY.**—The U. P. R. R. use  
the Westinghouse patent air brake; Miller's patent trussed  
platform and elastic car-coupler; and the most approved  
construction of cars for the comfort and safety of passen-  
gers.  
**PULLMAN'S MOST MAGNIFICENT SILVER PALACE**  
Sleeping Cars attached to express trains.  
**T. L. KIMBALL,**  
General Passenger Agent, Omaha.

PENNSYLVANIA CENTRAL R. R.  
AND  
Pittsburgh, Fort Wayne and Chicago R. R.

**61 Miles the shortest line**  
From Chicago to New York. Three daily lines of  
**Pullman's Palace day and Sleeping Cars,**  
from Chicago  
to Pittsburgh,  
Harrisburg,  
Philadelphia  
and New York  
**WITHOUT CHANGE!**  
With but one change to Baltimore, Hartford, Providence,  
Springfield, New Haven, Worcester, Boston. And  
is the most direct route to Washington city.  
Express trains on this line are equipped with WEST-  
INGHOUSE PATENT AIR BRAKES,  
**Boston and New England Passengers**  
will find this route especially desirable, as it gives them  
an opportunity of seeing the finest views among the  
Alleghany Mountains, besides visiting Pittsburgh, Phila-  
delphia, and New York without extra cost.  
All New England Passengers holding through  
tickets will be transferred, with their baggage, to Rail  
and Boat connections in New York WITHOUT CHARGE.  
Through Tickets via this great short route for sale in  
San Francisco, at 422 California street, 208 Montgomery  
st., 306 Montgomery st., and at Ticket office of Central  
Pacific R. R. in Sacramento, and at Salt Lake, Cheyenne,  
Denver and Omaha. Be sure your tickets read via  
Pennsylvania, Central & Pittsburgh, Ft. Wayne and Chicago  
route.  
**J. R. ERRINGER, Jr., Gen'l Agent,**  
4v22-1y **San Francisco, Cal.**

**EXTRAORDINARY GROWTH OF A ROSE SLIP.**—The Los Angeles *News* of June 22d, says: "One year ago Mrs. Bettis, at her residence on Main street, set out a rose slip about a foot long. It grew, divided in two branches, and is now trained over the window. If straightened out the vine would reach to the top of the two-story building at the foot of which it was planted, and the two branches united would measure over fifty feet in length. Flowers and trees have but to be planted and watered; soil and climate do the rest. The above, though but one instance of the rapid and wonderful growth often attained under the genial influence of our southern sky, will doubtless appear incredible to the dwellers in less favored regions."

**BOUQUET OF GLADIOLUS.**—We have received from Mr. J. W. Thompson, of the Suscol Orchards, Napa county, a magnificent bouquet of 22 new varieties of Gladiolas, imported from Boston, last spring. Fifty varieties were imported; but 22, only were in bloom when this bouquet was plucked.

**DR. WM. BARSTOW**, our able associate in editorial labors on the PRESS, has lately gone to his old home in N. H., to administer to the comforts of an aged father—a parent highly blessed with a son worthy and dutiful in all he undertakes.

#### Fair Samples.

During the Autumn Fair Season it is the purpose of the proprietors to bring the attention of every person engaged in the line of industries represented by this journal, to the personal benefit to be gained by its patronage and regular reading. We are not only determined to print a superior paper, but are bound that people shall know it, see it, and learn its power of self-elevation and practical benefit, by experience.

To accomplish this we have concluded to print (perhaps weekly) during the Fair season, many extra papers as fair sample copies of the PRESS for gratuitous and judicious circulation amongst the very best class of citizens—i. e., the steady, industrial, intelligent and producing population. By this liberal means our regular circulation will be greatly extended, and the different individuals who will receive and critically examine the paper and its entire contents will aggregate an immense number during the next three months.

#### Special to Inventors.

All inventors who secure valuable patents through the SCIENTIFIC PRESS PATENT AGENCY are specially favored with a liberal notice of the merits of their inventions in the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS—two first-class weeklies, the most widely circulated of any on this coast, reaching the very best classes for the benefit of our ingenious citizens. In many cases we know that such notices have been worth more to patentees than the whole cost of obtaining patents. While we give the most able and experienced counsel to inventors, our terms are more favorable to Pacific Coast inventors than those of any other Agency in the United States, besides the benefit derived from having their inventions set forth rightly in the start by gratuitous publication in more than one highly reputable journal.

#### TRADE MARK PATENTS

—FOR—

#### Merchants and Manufacturers

Can now be secured to advantage under the

#### NEW LAW

In the United States. Parties interested will be furnished with all information desired, and have their application intelligently prepared and promptly forwarded to the Patent Office, and their patents secured in good time, by DEWEY & CO., U. S. and Foreign Patent Agents, No. 414 Clay street, S. F.

Copies WANTED of the SCIENTIFIC PRESS of January 7, 1871. We will pay 25 cents per copy, at this office, and also feel obliged to the sender.

#### GOOD HINTS ABOUT ADVERTISING!

Be Careful of your Seed! Sow it in Good Ground!

If you have goods to sell to farmers, it will pay you better to advertise in a farming paper, read and preserved by 10,000 intelligent farmers, than in miscellaneous daily or weekly journals with 20,000 readers, comprising only 1,000 farmers. A mining journal in California with 10,000 readers reaches more miners than any other ten papers in the Union.

Purchasers are more likely to look for information in the advertising columns of a paper devoted to their special interests, than elsewhere, when ready to buy. Some will not read advertisements upon any other occasion.

Weekly journals are read most leisurely and carefully, and at a time when the subscriber is most favorably inclined to examine advertisements. The newspaper most specially representing your particular branch of industry is usually best entitled to your patronage, and the most profitable medium you can employ.

Advertisements appearing in a handsomely printed journal of established good character are more effective and beneficial to permanent dealers than when inserted in a shabby sheet of indifferent reputation.

Advertising in cheap priced mediums (of limited circulation) is like buying goods at retail when you could as well take them at wholesale.

Information imparted to a list of superior and intelligent and active and industrious readers (naturally looked up to by others for information), is seed sown in good soil for the advertiser.

Fame and fortune are gained, nine times in ten, by liberal and judicious advertising.

#### The Pacific Rural Press is meeting with Popular Success.

New correspondents are coming to its aid and its patrons are increasing from various sections at home and abroad. Testimonials of the great value of its timely and fresh information are daily received, and we now know that we can and shall publish and maintain a first-class agricultural journal of great profit to every reader and of essential benefit and importance to the community of the Pacific Coast. April, 1870.

The *Scientific Press*, of San Francisco, Cal., is now illustrating the beautiful scenery on the line of the Central and Union Pacific Railroads. This journal is of the same size and form as the *Scientific American*, and is one of the most valuable publications on the Pacific Coast. Published weekly by Dewey & Co., 414 Clay street. Terms, \$4 per annum.—*Iron World and Manufacturer*, Pittsburg, Pa.

We have been pleased to meet Wm. H. Murray, Esq., traveling agent of that most valuable mining journal, the *SCIENTIFIC PRESS*, of San Francisco.

He was here some four or five days, visiting our mines and mills, gathering items regarding our resources, and soliciting for the journal which he represents.

The PRESS, as a scientific and mining paper combined, is without an equal in America, and we are pleased to know that hereafter it will have a goodly number of readers in this mining camp.—*Colorado Miner*, Georgetown.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Returning a newspaper or blank slip, WITHOUT the name and residence of the subscriber is a thoughtless act, and useless both to subscriber and publisher.

READERS will favor advertisers by mentioning the information gained from notices in our paper.

Complete Volumes of the *Scientific Press* from January, 1864, can be had at this office at \$3 per volume. Bound in cloth, \$5. A limited number only on hand.

**MARAVILLA COCOA.**—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to obtain a reputation for their prepared Cocos, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopathic and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicago Mills, Bruges, Belgium. f623-ly

FOR THROAT DISEASES AND AFFECTIONS OF THE CHEST, "Brown's Bronchial Troches," or Cough Lozenges, are of great value. In Coughs, Irritation of the Throat caused by cold, or Unusual Exertion of the vocal organs, in speaking in public, or singing, they produce the most beneficial results. The Troches have proved their efficacy.

"I CAN'T SEE IT!" say many. But if you really wish to see with a good strong sight you should go to the store of C. MULLER, No. 205 Montgomery street, and look through his glasses.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

#### Premium for New Subscriptions.

There are many persons not familiar with the value of the PRESS who would ever after be thankful to our present subscribers for bringing their names on to our list of intelligent readers. Large additions can be made with little effort by the many in this way. We therefore offer (post paid) a premium of one of the patent newspaper file holders (advertised in this paper) for every two new subscriptions received with \$8 advanced payment.

#### A Good Binder for \$1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for \$1.50—containing full title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in hook form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Sent postage free. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS.

#### FOREIGN PATENTS

For Pacific States Inventors

ARE SECURED IN MUCH LESS TIME,

—BY—

DEWEY & CO.,

Proprietors of the

SCIENTIFIC PRESS,

Than through any other Agency.

ESTABLISHED IN 1860.

This Firm can be Relied Upon

—AS—

HONEST, COMPETENT, PERMANENT.

All of which points are imperatively requisite in Attorneys, for the interests of their Applicants for Patents in distant lands.

Our Associates and Correspondents are the Best Practitioners in every country where Patents are granted.

For Foreign Patents no model is required except in Canada. The Specifications and Drawings of the American Patent, if complete and perfect, will suffice for us to prepare the case. In Great Britain and other countries we apply for patents in the inventors' own names, thus avoiding their being published to the world in the name of a foreign agent, as is usual through other and less painstaking agencies.

Frequently several inventions, covered by different patents in the United States, on the same subject, can be skillfully combined in one patent in foreign countries when well understood by intelligent attorneys. As the privileges of our inventors are cut off in some countries, and curtailed in others, if not applied for soon after the issue of the U. S. patent, we advise inventors whose patents will be valuable in various populous civilized countries, to lose no time in applying for patents whenever they intend to obtain them for themselves or the benefit of others—with their own means or through the resources of those who are permitted to share the benefit. It must be remembered that the English (and some other important nations) invite the early introduction of inventions into their realms, by offering patents to the first introducer (which means the first applicant), without regard to the rights of the actual inventor, who has no after recourse.

For important inventions it is best to apply for foreign patents at the time of application for or before the issue of the U. S. patent.

We have the Foreign Patent Laws, Foreign Patent Reports, and other valuable and assisting documents, for easy reference in our Scientific Press Patent Agency Library—the most complete Patent Library on this side of the Continent.

Any further information regarding the time within which patents must be worked in any foreign country, time of payment and amount of annuities for patents in any of the above countries, will be cheerfully given on application.

Full particulars regarding any countries not named above, will also be given when desired.

DEWEY & CO.,  
Patent Agents.

Publishers of the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS, San Francisco.

#### CHOLERA.

HOW TO CURE IT.

At the commencement of the Diarrhea, which always precedes an attack of the Cholera, take a teaspoonful of the Pain Killer in sugar and water (hot, if convenient), and then bathe the freely the stomach and bowels with the Pain Killer clear. Should the diarrhea or cramps continue, repeat the dose every ten or fifteen minutes until the patient is relieved. In extreme cases, two or more teaspoonfuls may be given at a dose.

The Pain Killer, as an internal remedy, has no equal. In cases of Cholera, Summer complaints, Dyspepsia, Dysentery, Asthma, it cures in one night, by taking it internally, and bathing with it freely. Its action is like magic, when externally applied to Old Sores, Burns, Scalds, and Sprains. For Sick Headache and Toothache, don't fail to try it. In short, it is a PAIN KILLER.

Directions accompany each bottle. The Pain Killer is sold by all dealers in Medicines. Prices, 25 cents, 50 cents and \$1 per bottle.

#### HOOVER'S

#### New and Superior Chromos.

The Changed Cross, size 22 by 28.  
The Faithful Crowned, size 22 by 28.  
Virgin Mary and St. John, size 22 by 28.  
The Holy Family, size 22 by 28.  
The Beautiful Snow, size 16 by 22.  
Delhi, Delaware County, N. Y., size 20 by 28.

#### ALL REAL GEMS OF ART.

Sold by Leading Dealers throughout the United States, and Wholesale by the Publishers.

J. HOOVER,

804 Market Street,

PHILADELPHIA.

#### LEA & PERRINS'

CELEBRATED

#### Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, label, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauces and see name on wrapper, label, bottle and stopper. Wholesale and for export by the Proprietors, Worcester: Crosse and Blackwell, London, &c., &c., and by Grocers and Chemists universally. Agents, CROSS & CO., San Francisco. 1722-lyeow

#### WE HAVE SENT HUNDREDS OF SINGLE WALTHAM WATCHES

To the Pacific Coast

BY MAIL AND EXPRESS,

And in every case with satisfaction to the purchaser.

#### The Prices are now all Reduced!

SOLID SILVER HUNTING WATCHES as low as \$15.  
SOLID GOLD HUNTING WATCHES as low as \$65.

Our Prices are all in Greenbacks, and we deal in none but GENUINE WALTHAM WATCHES.

Every one who wants a Watch or feels a desire to be posted, should write to us for our Illustrated History of Watchmaking. It will cost you nothing, as we send it postpaid without charge, and with it a full Catalogue of all the Watches with prices of each. When you receive this you will be surprised at the low rates, and you will then understand our plan of sending Watches to any place, however remote, without any risk to the purchaser.

We send any Watch you order, and let you examine it before you pay for it. Do not order a Watch until you have first sent for the Price List, and when you write please mention the SCIENTIFIC PRESS.

Address in full,

HOWARD & CO.,

Watchmakers and Jewelers,

NO. 865 BROADWAY, NEW YORK.

We have a full stock of extra heavy Cases, such as 4, 5, 6 and 8 oz., always on hand, and can fill all orders promptly. 26v1-bp-aw

A liberal discount to clubs or dealers who buy by the dozen. Address the inventor and manufacturer, D. N. PHILPS, 31-15-awbp San Leandro, Alameda County, Cal.

#### BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, THAT BETTS'S NAME IS ON EVERY CAPSULE he makes for the principal merchants in England and France, thus enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpose of the ornament but that they are serviceable in protecting the wine from injury, and insuring its genuineness. MANUFACTURERS:—L. WHARF ROAD, CITY ROAD, LONDON, AND BORDEAUX, FRANCE.

## Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

**Eagle Quicksilver Mining Company—Location of works, Santa Barbara County, California.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of June 1871, an assessment of Twenty dollars per share was levied upon the mines of said Company, payable immediately in gold coin of the United States, to the Secretary, at his office, Room No. 5, No. 302 Montgomery street, San Francisco, California.  
Any share upon which said assessment shall remain unpaid on Wednesday, the 9th day of August, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 14th day of August, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, California.

**Highland Silver Mining Company—Location of works, Railroad District, Elko County, State of Nevada.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 13th day of July, 1871, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 428 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Monday, the 21st day of August, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 14th day of September, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.  
DAVID WILDER, Secretary.  
Office, No. 28 Merchants' Exchange, California street, San Francisco, Cal. July 15-td

**Mountain City Mining Company—Location of mine, Cope District, Elko county, State of Nevada.**  
Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 8th day of June, 1871, the several amounts set opposite the names of the respective shareholders, as follows:  
Names. No. Certificate. No. Shares. Am't.  
Best, John T. .... 61 400 \$100 00  
Enright, John T. .... 63 250 62 50  
Greek, H. J. .... 42 100 25 00  
Hohron, W. M. O. .... 23 50 12 50  
Hohron, W. M. O. .... 24 10 2 50  
Hohron, W. M. O. .... 25 10 2 50  
Hohron, W. M. O. .... 26 10 2 50  
Head, Francis. .... 62 400 100 00  
Sharp, Wm H. .... 70 900 225 00  
Titus, H. W. .... 49 400 100 00  
Titus, H. W. .... 50 200 50 00  
Titus, H. W. .... 51 100 25 00  
Titus, H. W. .... 52 100 25 00  
And in accordance with law, and an order of the Board of Trustees, made on the 8th day of June, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on the 8th day of August, 1871, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.  
T. B. WINGARD, Secretary.  
Office, 206 Front street, San Francisco, Cal. July 22-2w  
Advertising charges, \$2 each certificate.

**Nevada Land and Mining Company—Location of works, Steptoe, Johnson and Latham, Antelope and Clifton Districts, Elko County, State of Nevada.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 26th day of July, 1871, an assessment of four (4) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room 5, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Tuesday, the 29th day of August, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 20th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, California. July 25-5w

**North America Consolidated Mining Company—Location of works, White Pine Mining District, County of White Pine, State of Nevada.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 31st day of July, 1871, an assessment of Twenty (20) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 5, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Tuesday, September 5th, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 30th day of September, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal. Aug 5td

**Pinto Mining Company, Location of Works, Silverado, Pinto Mining District, White Pine County, Nevada:**  
NOTICE.—There are delinquent upon the following described stock, on account of assessment levied May 24th, 1871, the several amounts set opposite the names of the respective shareholders, as follows:  
Names. No. Certificate. No. Shares. Am't.  
Leopold Jacobi. .... 1 60 \$ 7 50  
Leopold Jacobi. .... from 2 to 32 50 193 75  
A H Ward, Jr. .... 111 805 100 62  
Henry G Langley. .... 171 1610 201 25  
Robert E Johnson. .... 213 321 1/2 40 21  
Erasmus Olson. .... 212 10,000 1,250 00  
D B Arrowsmith. .... not issued 1,610 201 25  
And in accordance with law, and an order of the Board of Trustees, made on the 24th day of May, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on the 17th day of July, 1871, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.  
D. B. ARROWSMITH, Secretary.  
Office, 426 Montgomery street, San Francisco. 26v22-3t

**PINTO MINING COMPANY.**—The above sale is postponed until Wednesday, the 16th day of August, 1871, at the same time and place. By order of the Board of Trustees.  
D. B. ARROWSMITH, Secretary.

**Tecumseh Gold, Silver and Copper Mining Company—Location of Works, Gopher District, Calaveras county, California.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 26th day of July, 1871, an assessment of five dollars (\$5) per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, S. J. Hermann, at the office of the company, 516 Kearny street. Any stock upon which said assessment shall remain unpaid on the 4th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 28th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
S. J. HERMANN, Secretary.  
Office, 516 Kearny street, San Francisco. Aug 5td

## I. N. WILFONG'S

PATENT CIRCULATING

## STEAM BOILER.

This cut represents an improvement on the old style of Cylinder Boiler, and combines all the following great advantages: Rapid circulation and generation of steam; economy in fuel; durability, safety, and simplicity of construction; requires but little attention; is easily repaired, and moderate at first cost.

We have now a number in successful operation, and respectfully refer to the following well known parties: Hastings & Co., Seventh and Cherry streets; Jos. Lea & Co., 128 Chestnut street; J. S. Huber, Germantown; Holt & Bro., Sixth and Susquehanna avenue; Albion Print Works, Conshohocken, Pa.; S. H. Diekey, Oxford, Pa.—all of which are giving ENTIRE SATISFACTION. Parties wishing to investigate the success of our new Boiler can do so by calling at any of the above named places, or to

## I. N. WILFONG,

131 and 135 North Twenty-second St.,

Manufacturer of all descriptions of Boilers (Rogers & Black's patent included), Tanks, Stills, Pans, and general Iron Work. Orders solicited from all parts of the country, and, when received, promptly attended to. State and County Rights and Royalties for sale as above. 5v23-6m-cow

Any stock upon which said assessment shall remain unpaid on the 7th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 28th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
CALEB T. FAY, Secretary.  
Office, Room No. 7, No. 428 California street. Aug 5td

## 7-30 GOLD LOAN

OF THE

## Northern Pacific Railroad.

RAPID PROGRESS OF THE WORK.

The building of the Northern Pacific Railroad (begun July 1st) is being pushed forward with great energy from both extremities of the line. Several thousand men are employed in Minnesota and on the Pacific coast. The grade is nearly completed 266 miles westward from Lake Superior; trains are running over 180 miles of finished road, and track-laying is progressing at the rate of one to two miles per day. Including its purchase of the St. Paul & Pacific Road, the Northern Pacific Company now has 413 miles of completed road, and by September north this will be increased to at least 560. A GOOD INVESTMENT. We are now selling, and unhesitatingly recommend, as a profitable and perfectly safe investment, the First Mortgage Land Grant Gold Bonds of the Northern Pacific Railroad Company. They have 30 years to run, bear Seven and Three-tenths per cent. gold interest (more than 8 per cent. currency), and are secured by first and only mortgage on the ENTIRE ROAD and ITS EQUIPMENTS, and also on 23,000 ACRES OF LAND to every mile of track, or 500 Acres for each \$1,000 Bond. They are exempt from U. S. Tax; Principal and Interest are payable in Gold; Denominations: Coupons, \$100 to \$1,000; Registered, \$100 to \$10,000.

LANDS FOR BONDS. Northern Pacific 7-30's are at all times receivable at TEN PER CENT. ABOVE PAR, in exchange for the Company's Lands, at their lowest cash price. That is, in addition to their character as a first-class, prompt-paying Railroad security, these Bonds are in effect Land Warrants bearing a profitable rate of interest until exchanged for Homesteads, at TEN PER CENT. PREMIUM.

SINKING FUND. The Land Grant of the Road exceeds Fifty Million Acres, having an average soil of great fertility, in a climate that is simply unsurpassed. The Trustees of the Mortgage, Messrs. Jay Cooke and J. Edgar Thomson, are required to devote the proceeds of all Land Sales to the repurchase and cancellation of the Company's Bonds. This immense Sinking Fund will undoubtedly cancel the principal of the entire issue of First Mortgage Bonds (now selling) before they fall due. With their ample security and high rate of interest there is no investment accessible to the people, which is more profitable or safe.

EXCHANGING U. S. FIVE-TWENTIES. In view of the Government's expectation soon to call for the surrender of its outstanding 5 per cent. Bonds, under the present movement for funding the debt at lower interest, many holders of United States Five-Twenties are exchanging them for Northern Pacific Seven-Thirties, thus realizing a handsome profit, and greatly increasing their yearly income.

OTHER SECURITIES-AGENCIES. All marketable Stocks and Bonds will be received at their highest current price in exchange for Northern Pacific Seven-Thirties. EXPRESS CHARGES on Money or Bonds received, and on Seven-Thirties sent in return, will be paid by the Financial Agents. AGENTS for the sale of this loan are established in nearly every city and important town throughout the United States and Canada. Full information, maps, pamphlets, etc., can be obtained on application at any agency, or from the undersigned.

For Sale by

JAY COOKE & CO.,  
Philadelphia, New York and Washington,  
Financial Agents Northern Pacific Railroad Co.  
By Banks and Bankers generally throughout the country. mar25-13t-cow

## The California Powder Works

No. 314 CALIFORNIA STREET.

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others. We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use. A circular containing a full description of this Powder can be obtained on application to our Office. 16v20-3m JOHN F. LOHSE, Secretary.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION.—D is a glass chamber which contains the lubricant. O is a valve connecting with cup which introduces the lubricant into chamber D. F is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E is a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B is a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the injection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. fcl5-tf

## THE PATENT Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Panning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired. For further information apply to R. STONE, 25v22-3m 422 Battery street, San Francisco.

## McAFEE, SPIERS &amp; CO., BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco 2v21-tf

## WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbag," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation. For further particulars address

FURMAN R. WILSON,  
San Francisco.

## STEAM JET PUMP.

Blakslee &amp; Williams' Patent.—For Water, Oils, Acids, Etc.

The best COLD WATER pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit.—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

Send for Circular. PARKER &amp; HUNT, Southeast cor. Tenth &amp; K Streets, Sacramento City Cal. AGENTS—CHAS. F. BROCK, 117 California St., San Francisco; KEEP &amp; BARGON, Stockton. Can be seen at McAFEE, SPIERS &amp; Co's. Boiler Works, S. F. 21v21-tf

### PLATINUM Vessels, Apparatus, Sheet, Wire, Etc., Etc. For all Laboratory and Manufacturing Purposes H. M. RAYNOR, 25 Bond street, New York. Platinum Scrap and Ore purchased. 22v18t

### Varney's Patent Amalgamator.

These Machines Stand Unrivaled.  
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repair. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.  
The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

### The Stetefeldt Furnace.

For information of any description respecting this process,  
APPLY TO

### STETEFELDT FURNACE COMPANY.

Duncan's Building, Room 1, California Street,  
4v21-1y San Francisco.

## THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

### IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

LORD & PETERS,

### To Coal Operators, Miners and Railroad Corporations.

YOUR ATTENTION IS INVITED TO

### THE GRICE & LONG LOCOMOTIVE WORKS,

1340 Beach Street, Philadelphia, Penn.

Patentees and Builders of Mining and other Locomotives;

Also, Patent Traction Engines for Suburban and NARROW GAUGE Roads, Furnaces, Quarries, Contractors, Etc. Now extensively introduced and indorsed by many of the Largest Coal Operations and Furnaces in Pennsylvania and elsewhere—and adapted for gauges of two feet and over, and weighing from four to nine tons. Messrs. G. & L. were the PATENTEE'S AND BUILDERS of the FIRST COLLIERY LOCOMOTIVE introduced into the Mining District of Pennsylvania.

SEND FOR CIRCULAR AND PHOTOGRAPHS.

23v22-3m

## Miscellaneous.

### SANBORN & BYRNES,

South Point Mills, Berry Street,  
Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners, Billiard Balls and Ten Pins. Fancy Newels and Balusters. 21v22-6m.

Sects and Creeds differ, but there are no dissenters from the general principle, that a great medicine is a great blessing. We have many of these blessings, but among them all, in the province to which it belongs, no greater than

### Tarrant's Effervescent Seltzer Aperient.

A column would not suffice to enumerate the ailments for which it is prescribed by physicians of the highest standing. It does not belong to the class derisively termed patent medicines, but is an article based on scientific analysis, and will stand the test of the sharpest and most rigid medical criticism as a cathartic, a stomachic, an anti-febrile preparation, and an admirable remedy for all bilious complaints. LET THERE BE NO MISTAKE. SECURE THE GENUINE ARTICLE ONLY. SOLD BY ALL DRUGGISTS.

### NELSON & DOBLE, AGENTS FOR

### Thomas Firth & Sons' Cast Steel.

MANUFACTURERS OF  
Sledges, Hammers, Stone Cutters', Blacksmiths' and Horse-Shoeing Tools.  
13 and 15 Fremont street, near Market, San Francisco. 10v14qr

### GOLD-SAVING Silver-Plated Amalgamating Plates FOR MINERS AND MILL MEN,

At San Francisco Plating Works, 655 Mission Street, San Francisco.

Goods of every description Plated.  
Old Goods Re-plated.

E. G. DENNISTON, Proprietor.  
24v22-3m

### California File Manuf'g Co.

437 BRANNAN STREET, bet. Third and Fourth.  
W. WUSTHOFF, L. KRAMER.

### REAPER AND MOWER SECTIONS, BARS AND KNIVES COMPLETE.

At a saving of 50 per cent. New Files of every description on hand and made to order. Old Files re-cut, and warranted equal to new. Orders from the country promptly attended to. 9v19-gy

### CAST IRON PIPE, FOR WATER AND GAS.

PIPE of all sizes, of a very superior quality, is now being made at the

### PACIFIC IRON WORKS,

In this city, under the Patents of Farrar & Whiting.  
23v22-3m GODDARD & CO.

### WHELPLEY & STORER, FURNACES, MACHINES AND PROCESSES.

WHELPLEY & STORER offer for sale their Pulverizers, Processes, and Water Furnaces for Gold and Silver Ores, in any part of the United States, and the Stetefeldt Furnace in Mono and Alpine Counties, Cal. They have no agents in California, Nevada or elsewhere. Address JACOB J. STORER, Boston, Mass. 24v22-3m

**DEWEY & CO.,**  
American and Foreign Patent  
Agents, Publishers of  
the Scientific Press,  
San Francisco.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

**Foreign Patents.**

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

**Home Counsel.**

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

**Confidential.**

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us.

**Engravings.**

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

**DEWEY & CO.,**

**BANDMANN, NEILSEN & CO.,**  
General Agents, No. 210 Front Street.

The Largest and Best in America.

**The Scientific Press,**

Established in 1860, is now the Largest, Most Original, Best Illustrated and most Ably and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interesting style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past or in any one other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

The progress of our journal has been steady and unvarying. Encouraged by a liberal class of readers who exhibit their appreciation in a substantial way, we shall, with our increasing facilities, experience and information, make each coming issue superior to its predecessor.

Let every friend of Science and Industry on this side of the continent take pride, not only in sustaining, but accelerating the advancement of a faithful representative of its highest interests by subscribing for it and urging its patronage by others—now, without delay.

Subscription \$4 per annum, in advance.

**Eighth Industrial Exhibition**

—OF THE—

**MECHANICS' INSTITUTE**

WILL BE OPEN TO THE PUBLIC

AT 11 A. M. TUESDAY, AUGUST 8, 1871,  
With the usual Ceremonies.

**HON. MILTON S. LATHAM**

Has consented to deliver the OPENING ADDRESS.

The EXHIBITION BUILDING is situated on  
**Union Square,**

In the heart of the city of San Francisco, and on the line of three street railroads. The building covers a ground area of 95,200 feet, and is complete in all its appointments.

Steam power and water supply furnished free to exhibitors.

All goods competing for premiums, or to be catalogued, must be received for by the entry clerk before August 12th.

Rules and Regulations can be obtained from any of the officers at the Institute or Pavilion.

In conjunction with the Industrial Exhibition, the

BAY DISTRICT HORTICULTURAL SOCIETY will hold its first Exhibition of the Fruits and Flowers of California, occupying a space of 320x50 feet.

**PRICES OF ADMISSION:**

Season Tickets admitting gentleman and one lady, \$5 00  
Season Tickets admitting one person, 3 00  
Season Tickets admitting juveniles under 14 years, 1 50

The above Tickets are not transferable.

Single Admission, 50 cts.  
Children under 14 years, 25 cts.

Children must be in charge of guardians or parents. Tickets can be obtained from any of the Managers, at the Mechanics' Institute, 27 Post street, at the Pavilion, Union Square, or from the principal Music or Drug Stores in the city.

No bills will be paid unless ordered by the proper Committees. By order

A. S. HALLIDIE, President.

W. H. WILLIAMS, Secretary.

A Mining Engineer, a native of Cornwall, England, of large experience, who has been superintending extensive copper mines in Sweden for several years, is desirous of an engagement in this country. For economy of management and successful working, the most satisfactory reference can be given; also for general mining ability and strict integrity. Application can be made to Mr. JOHN EVERITT, 168 Fulton street, New York City.

July 22-4t-16p

# SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,  
Mining, Mechanic Arts and Inventions.

BY DEWEY & CO., Patent Solicitors, SAN FRANCISCO, SATURDAY, AUGUST 12, 1871. VOLUME XXIII. Number 6.

## The Selden Direct-Action Steam Pump.

It is only within a comparatively short time that direct-action steam pumps have come to be regarded with any favor whatever by engineers. At first the very advantages of this kind of pumps were urged against them, as objections. Containing as they do the essential elements of a perfect pump, and having a marked superiority over the fly-wheel pumps, they have gradually taken the field and are driving all other kinds out of use. At the present time the fly-wheel pump is the exception and not the rule.

One of the chief difficulties met with by the makers of direct-action pumps has been in devising a perfectly reliable valve-motion, and the amount of labor and ingenuity expended in getting complicated valve gears, which answered every requirement except the desired one, is something enormous to think of.

It is now pretty generally admitted by our best hydraulic engineers that a pump cannot be trusted to move its own steam valve directly. The solution of the problem is to make the valves steam driven.

Mr. Wm. C. Selden, formerly of the U. S. Navy, is the inventor of the pump which we illustrate, and in it gives us such an answer to the question—"How shall we make the steam move the valve?" as to be worth a place in all treatises upon mechanics or hydraulics, because of its simplicity and the ease and perfection with which it does its work.

There are only five moving parts, consisting of tripping lever, valve rod, small valve, auxiliary piston, and main valve. The method of working and the operation of the parts may in a general way be stated thus: Near the end of the stroke, the button on the piston trips the lever and moves the small valve which lies in the slot in the main valve. By this motion steam is admitted upon one side of the auxiliary piston, and allowed to exhaust from the other. As this piston makes its stroke it works the main valve of the steam cylinder. The office of the main valve is

to admit steam to the auxiliary piston. The center ports unite below and form a common exhaust for both cylinders. The ports, *E, E*, are not covered by valves and are connected to the steam pipe to admit steam to the steam chest.

The main steam valve, *P, C, B*, Fig. 3, consists of two ordinary D valves joined

of the bridge, but are closed by the planed parts of the bridge at all other times. In Fig. 2 the small piston is represented as having just completed its stroke, and consequently its exhaust passage is entirely closed by the center portion of the bridge, *B*, resting upon the back of the valve, *A*.

Fig. 1.

THE SELDEN DIRECT-ACTION STEAM PUMP.

more. The reverse stroke is made in the same way;—the small valve moving first and opening the steam and exhaust ports for the auxiliary cylinder, the piston of this cylinder in its turn moving the main

valve by a bridge. The space between them is filled by the main valve. The bridge fits closely upon the back of this valve, and by means of the two small D-like spaces shown in the cut, performs the part of an

never seen equalled.

A. Carr, Esq., 43 Courtland street, New York city, is the sole proprietor and manufacturer of these pumps. Some of the chief advantages of these pumps are, the

valves used are slide valves of the ordinary D pattern, with which all engineers are familiar. When out of order they can be repaired or renewed by any ordinary mechanic. This will be seen by an examination of the cuts. The valves themselves are plain slides, and can be ground into place without difficulty, their whole work being performed by the ingenious arrange-

Fig 2

Fig. 3

valve and being cushioned by it as above described.

Figure 1 shows the external appearance of the pump. Figure 2 a section through the steam chest, and Fig. 3 a plan of the valve seats and perspective view of the valves.

The outer ports, *L, L, L, L*, Fig. 3, are the steam ports of the main cylinder, and are covered by the main valve, they unite below and form one port at the point where they enter the cylinder as in the ordinary steam engine.

The ports, *F, F*, are covered by the auxiliary valve and by means of the ports, *I, I*,

independent cut-off valve for the exhaust of the small cylinder; thus producing the desired cushion. The value of this cushioning can hardly be over estimated; for by limiting and regulating the travel of the small piston, it completely regulates the motion of the main valve, and through it prevents the possibility of any pounding in the main cylinder.

The small valve is a rectangular block of brass, planed on each face, and has three openings through it. These openings communicate with each other at the proper points of the stroke, by means of the hollows (mentioned above) in the under side

ment of the ports. This simplicity is a very decided advantage over piston valves as used in many other pumps, which can only be repaired by being rehored and new pistons fitted, which requires the service of most skilled workmen, or else the parts must be sent to the shop where built for repair. In fact, the pump as a whole has the advantage that there is no part of it that cannot be repaired or renewed in any ordinary machine shop.

EXPERIENCE in Eastern Oregon shows that sage brush land, when irrigated, always produces good crops of hay, grain, etc.

## SCIENTIFIC PROGRESS.

**WEATHERING OF COAL.**—Dr. Richters states that the property which coal has of taking up oxygen, when heated gently (as to 375° F.) is modified essentially by its percentage of disposable hydrogen. This first becomes oxidized, forming water; then the oxygen enters directly into combination with the coal. The carbon of stone coal possesses, at a temperature of about 372° F., a variable affinity to oxygen; as the smaller portion (5 to 6 per cent. of the total amount) combines with oxygen to form carbonic acid; the rest shows little or no affinity for oxygen. These two propositions apply equally well at the ordinary atmospheric temperature. The so-called weathering of coal he ascribes to the absorption of oxygen which in one case oxidizes a portion of the carbon and hydrogen of the coal, converting it into carbonic acid and water; in the other, enters directly into the composition of coal. If then the coal becomes heated in any way, a more or less energetic chemical action, varying in proportion to the elevation of the temperature, takes place upon the combustible substance of the coal; but on the other hand the process of oxidation proceeds so slowly that the changes occurring within the period of a year can scarcely be established with certainty, either technically or analytically. Moisture, as such, seems to have no accelerating influence upon the weathering of the coal, except in the case of coal containing a large amount of sulphuret of iron or pyrites. Pure coal, heaped up for nine months or a year, unprotected from the weather, and not allowed to become heated, is changed no more than it would have been in a perfectly dry locality. As long as an increase of temperature does not exceed certain bounds, as from 340° F. to 375°, there is no appreciable loss of weight by the weathering; and, in fact, there should be a slight increase in consequence of the absorption of oxygen. The decrease in value for combustible purposes, and for other technical applications, which coal experiences by the weathering, is produced by a slight decrease of carbon and hydrogen, and an absolute increase of oxygen in consequence of the exposure.—*U. S. M. & R. R. Reg.*

**NOVEL SUBSTITUTE FOR GUTTA PERCHA.**—A singular marine plant is washed up on the shores in the vicinity of the Cape of Good Hope, South Africa, which has come into considerable use as a substitute for gutta percha and similar substances, in the manufacture of fancy articles, such as canes, picture frames, inlaid work, etc. It is of a dark color, and, when fresh, it is thick and fleshy; but when it is dried it becomes compact, and its surface looks like a beautifully grained deer's horn. After it becomes dry and hard, it can be rendered soft again by steeping in water, and in this condition may be stretched and formed into various shapes. It can also be reduced, when dry, to powder, then made plastic by soaking in water, and in this condition it may be stuck into almost any shape in a die press—coming out of the mould like articles formed of gutta percha. The plant is prepared for its industrial uses by cleaning it first with weak caustic alkali, and then with diluted sulphuric acid, after which it is washed, and before it is quite dry it may be pressed into sheets or any other form. It then may be rendered very hard by steeping it in a hot solution of alum, after which it is removed to a hot room where it is dried, and retains its shape afterward. Reduced to powder, it may also be mixed with various substances, like india rubber, and moulded into a great variety of articles.—*Coll. Courant.*

**TRANSMISSION OF SOUND BY WOODEN RODS.**—An interesting modification of Wheatstone's celebrated experiment of the Telephonic Concert was recently tried at the Central High School of Philadelphia. A rod of English deal, about twenty feet in length, and three-quarters of an inch thick, was let down through a platform into the room below. Insulation from the platform and the ceiling of the lower room was obtained by inclosing the rod with small sections of thick rubber hose. Against the lower end of the rod the sounding-box of a small tuning-fork was placed. On speaking or singing into the open end of this, the sounds were transmitted by the rod to the room above, the volume of the sound being increased by placing a guitar on the upper end of the rod. The experiment is exceedingly interesting and striking. Although the inter-

val between the notes is perfectly preserved, their intensity and quality are changed very decidedly, the effect being similar to that produced by ventriloquism. As the position of the rod is immaterial, striking effects can be produced as though by ventriloquism. A small figure placed on the end of the rod or on the sounding-box adds greatly to the effect. A song is transmitted in a very amusing manner. As it is preferable to have the sounding-box held so that the pulses should impinge in the direction of the length of the rod, the experimenter in the room beneath rested, for convenience, on a settee. This mode of transmission of sound does not, of course, give as good results as by means of hollow tubes, as the transmitted sound cannot be heard at so great a distance. It is interesting, however, from its novelty. *Journal Franklin Institute.*

**ORIGIN OF SPECIES.**—Mr. John Fisk, in one of the University course of lectures, at Harvard College, gave a summarized outline of Darwin's theory, as follows:—"When analyzed, the theory of natural selections will be found to consist of eleven propositions, of which nine are demonstrated truths, the tenth is an inevitable corollary from its nine predecessors, and the eleventh is an admissible postulate. Let us enumerate these propositions: 1. More organisms perish than survive. 2. No two individuals are exactly alike. 3. Individual peculiarities are transmissible to offspring. 4. Individuals whose peculiarities bring them into closest adaptation with their environments are those which survive and transmit their peculiar organizations. 5. The survival of the fittest thus tends to maintain an equilibrium between organisms and their environments. 6. But the environment of every group of organisms is steadily though slowly changing. 7. Every group of organisms must accordingly change in average character under penalty of extinction. 8. Changes due to individual variation are complicated by the law of that change set up in any one part of a highly-complex and coherent aggregate, like an organism; initiates changes in other parts. 9. They are further complicated by the law that structures are nourished in proportion to their use. 10. From the foregoing nine propositions, each one of which is undisputedly true, it is an inevitable corollary that changes thus set up and complicated must eventually alter the specific character of any given group of organisms. 11. It is postulated that, since the first appearance of life upon the earth's surface, sufficient time has elapsed to have enabled such causes as the foregoing to produce all the specific heterogeneity now witnessed."

**DURABILITY OF IRON.**—The late J. A. Roebling maintained that a good material and finished by the proper heat, by hammering or rolling, is stiffer and stronger than the same axle when again subjected to annealing without hammering or rolling; for, as annealing restores softness, but at the same time reduces cohesion and elasticity, to restore the iron of a brittle car axle fully can only be done by a full beat, with hammering or rolling, which of course reduces its diameter. The opinion, too, that a well drawn out fibre is the only sure sign of tensile strength, is true only when applied to ordinary qualities of bar or rail iron, the case being different with good charcoal irons and with steel. The greatest cohesion is accompanied by a fine, close-grained, uniform appearance of texture, which, under a magnifying glass, exhibits fibre, the color being a silvery lustre, free from dark specks. The finer and more close-grained the texture, the nearer the iron approaches to steel. Wire cables, car axles, piston rods, and all such pieces of machinery which are exposed to great tension as well as torsion and vibration, should be manufactured of iron which not only possesses great cohesion, but also a high degree of hardness and elasticity.—*Iron Age.*

**PHOSPHATIC SAND IN SOUTH CAROLINA.**—Prof. Shepard has described a deposit of sand over the phosphatic nodular bed of Stone River, which has resulted from the wear of the latter by the waters, and in some places is at least six feet thick. A portion of it, dry, was found to contain 27 per cent. of phosphate of lime, with 63.5 of sand and other matters. By agitation in water the most of the sand may be floated off, and the phosphatic portion thus concentrated to 37 per cent. of the remainder. This sand deposit appears to be very extensive. The phosphate is too impure for railroad exportation, but "for use on lands contiguous to water its future value cannot be doubted."

## MECHANICAL PROGRESS.

**ELEMENTARY AERONAUTIC APPARATUS.**—M. Foselli, say *Les Mondes*, during the progress of the siege, has been very seriously studying the problem of navigable aeronautic apparatus. We shall not presume to say that he has solved the problem, but his attempt certainly presents some new and ingenious peculiarities. His *aerostat* is a simple cylinder terminated by a cone intended to cleave the air, and surmounted by cones called *compensateurs*, which, by means of a very simple apparatus, may be made salient or reentrant, so as to equilibrate all the variations in pressure of the gas; so that it is not necessary to throw out ballast, or to let off gas, in order to rise or descend. The cylinder index is firmly fixed to a metallic chamber or cylinder with inflexible walls, of the same length as the machine. The chamber carries at its extremities propellers or helices which are intended to drive and guide the vessel. It is divided into compartments, each having its special use. One is hermetically sealed and is to hold atmosphere to be breathed when at a very great height. M. Foselli does not think it possible to steer in the disturbed atmosphere of the region of snows; but intends to reach that great elevation in which there is absolute calm. He estimates that in the region of perpetual calms atmospheric tension is reduced to one-half of what it is at the surface of the earth. Hence it was necessary to assure himself by vigorous calculations that it would be possible at so great an elevation to introduce sufficient air into the living chamber to maintain an atmospheric pressure of 750 millim., which is necessary for the normal action of the essential organs of life. M. Foselli was much surprised at finding that the arm of a single man acting upon a single air-pump will maintain, at ordinary tension, an amount of air sufficient for the respiration of several hundred persons. In a very rarefied and calm atmosphere a very slight motive force, or a very small screw, is sufficient to make the machine move, even when loaded. \* \* \* M. Foselli has discovered an unexpected fact which may lead to the means of navigating against the wind, or force the wind itself to give the machine a motion different from its own. He had suspended his model and had fixed to it two screws of like form and dimension, but mounted so as to act in opposite directions. These were set in motion by the descent of a weight. Who would not have supposed that under the action of these two screws, opposite in direction, equal and of contrary signs, the apparatus would have remained at rest? Yet it moved with a velocity greater than that due to the action of a single screw.—*Van Nostrand.*

**PROTECTING TELEGRAPH LINES FROM LIGHTNING.**—Much trouble has always been experienced from lightning on a section of telegraph line between Riverside and the stockyards, on the Chicago, Burlington, and Quincy Railroad. Poles are frequently shivered to splinters and much other damage done during the heavy storms which occur there during the summer. About a year and a half ago, Mr. F. H. Tubbs, tried the experiment of attaching a lightning conductor to each pole of this section, consisting simply of a No. 7 iron wire, one end of which was secured underneath the iron ring at the top of the pole, and the other buried in the ground, the wire making one complete turn around the pole two or three feet below the top. This simple and inexpensive precaution has thus far prevented any damage whatever from lightning on the section protected, although this is the second summer it has been in use, while formerly not a summer passed without several poles being destroyed in this manner.—*The Telegrapher.*

**A MONSTER IRON OBSERVATORY** is being erected on the roof of the Equitable Life Insurance Company, on Broadway, New York. It will be 22 feet high, while the roof of the building is 130 feet above the sidewalk. It will be constructed of iron, cased with slate, and the interior dimensions will be 10x14 feet. The probabilities of the weather will be indicated by balls 12 feet in diameter, which will be displayed upon two signal-staffs to be seen and understood from various points on Long Island Sound, Sandy Hook, and the inland waters of the Hudson and Harlem rivers. These will indicate where storms exist, and with how much force they are traveling. In the Equitable building will be exposed a large map, displaying all the immense ter-

ritory throughout which the service has its stations, reaching from Mexico to Canada, and from the Atlantic to the Pacific coast. The state of the weather will be indicated by ingenious dials at each of these stations, from which reports will be received at the Equitable every five hours. A bulletin hung by the side of the map will give the record of at least five preceding observations. The observatory in this city will form a part of an elaborate and perfect system of meteorological observations along the coast and throughout the interior.—*Amer. Artisan.*

**NEW STEAM TRAP.**—Chatwood & Cramp-ton's self-acting escape valve for drawing off water from steam pipes, etc., consists of a short vertical pipe, open at the top, which should be at a lower level than the cylinder or other steam vessel to be drained. Around the upper part of the pipe is formed a valve face, the face being downwards. The upper part of the pipe, with the valve-face above mentioned, is enclosed within a small vessel closed at the top and hanging at its lower end a neck, which fits on a parallel part of the pipe below the valve-face, and carries a corresponding valve seating set with its face upwards so that, when the vessel is lifted up, the valve and seating are in close and steam-tight contact, and when the vessel drops, the seatings separate and allow any fluid contained in the vessel to escape through grooves left in the neck. The action of this apparatus is as follows: When steam only is in the pipes, the vessel is pressed upwards, owing to the interior area of the vessel being greater at the top than at the bottom by the amount of the area of the valve face, and thereby the valve and face are closed together so as to prevent the escape of steam. When water is formed in the pipe by the condensation of steam, it gradually accumulates in the vessel until it overcomes the upward pressure of the steam, and causes the vessel to drop, thereby opening the valve and escaping through the grooves mentioned. When sufficient water has thus escaped, the steam pressure again lifts the vessel and closes the valve. Above the mouth of the vertical pipe is a guard, against which, when the valve opens, the condensed fluids are driven by the pressure in the steam vessel, so that, by their downward reaction, they tend to keep the vessel down and the valve open until the vessel is empty, or nearly so. A weighted lever, or weights, or springs, are also applied to the closed vessel, so as to regulate it to suit the pressure of steam in the engine or other steam vessel to which the apparatus is applied.—*Engineering.*

**THE ST. CHARLES BRIDGE**, over the Missouri, is composed of seven spans, varying from 306 to 321½ feet in length, and 4,800 feet of iron viaduct approach. The piers are of masonry with foundations from 76 to 22½ feet below water level. There are three spans over the mid-river, 90 feet above low water and admitting 900 feet shift of channel. The use and fall of the river at this point is 40 feet, and the depth of scour is 43 feet. During the progress of the work the river attempted to change its bed, cutting in over 1,400 feet just above the bridge. The successful controlling of the river was probably the most difficult part of the undertaking.

**IRON TELEGRAPH POSTS** have been introduced with great success in Switzerland and are being extended daily. They have been put up along the railways between Basle and Dudingon, Otten and Zurich, and St. Gallen and Rorschach—a total distance of 250 miles. In Prussia they have been placed experimentally on the railroad from Weissenfels to Gera, and on the line between Berlin and Potsdam. It is thought that they will altogether replace the wooden poles in Germany.

**LARGE ATLANTIC STEAMER.**—The "Spain," lately built by the Baird Brothers, of Birkenhead, England, is one of the largest Atlantic steamers ever constructed. Her length is 437 feet, breadth of beam 43 feet, burthen 4,900 tons. She has accommodations for 1,200 first-class and 1,400 steerage passengers. Her engines are stated to be the largest ever constructed on the compound principle.

**COPPER BALLOON.**—A balloon composed of copper is so far completed, that it is now exhibited to the public; this immense globe is formed of sheets of copper, united and soldered. The object proposed by this experiment is to resolve the problem of the practicability of the employment of metals in the construction of balloons.

## CORRESPONDENCE.

### A Trip to Colorado.—No. 5.

BY OUR OWN TRAVELER.

#### Ores of Gilpin County.

A question which is asked by many is, as to the value of the ores here. I think that outsiders hardly do justice in their estimates. I can, however, in this matter but refer them to the columns of the *Register* and the *Herald*, where they will find the best information attainable. Mr. G. W. Baker in his pamphlet on the treatment of ores gives 45 assays of undressed tailings which show an average of \$27.86 per ton; 23 of blanket tailings average \$59.33 per ton; and 38 of dressed tailings average \$42.90 per ton. These figures will give a slight indication of what the value of the raw ore must be. From my talks with well-informed gentlemen here, I am led to the belief that, with improved processes, Colorado is bound to be a first-class mining country. There is manifestly room for improvement here in the treatment of ores; but the ores occur in such enormous abundance that mining is sure to be profitable.

In this connection, I would also quote from a most excellent publication, the *Rocky Mt. Directory and Colorado Gazetteer*, published by S. S. Wallihan & Co., Denver. This gives a statement of ore extracted from the Kent county lode during five months in 1870, and then says:

"From this statement it will be seen that the cost of mining 1,375 tons, was \$7,125.25, an average of \$5.18 1-5 per ton, and that the stamp mill returns from this amount to \$16,827.25, an average of \$12.23 4-5 per ton. Add to the expense of mining, the cost of hauling the ore to the mill and milling, \$5.25 per ton, which amounts to \$7,218.75 for the 1,375 tons, and deduct these sums from the amount received, and the balance in favor of the miner will be \$2,483.25 clear gain above all outlays of every description. In this calculation, no allowance is made for the value of tailings. If the miner realized eighty per cent. from his 1,375 tons of ore, instead of thirty per cent. which is the highest average yielded by the stamp mill process, from some species of reduction works, which would not increase the expense of reducing the ore above that of the stamps, his profit on this amount of ore would be \$30,528.66, or about \$22.20 on each ton, a very handsome profit for five months' work, where only a small number of men were employed. These figures give not only a fair idea of the general expense of mining and milling in the gold regions of Gilpin county, but a glimpse at the enormous loss annually resulting from the absence of reduction works suitable for the treatment of sulphuret gold-bearing ores."

And from another table given, they draw the following conclusions: "This sum would be the total cost of mining 9,366 tons, with wages \$4 per day. Deduct from this twenty-five per cent., the difference between labor at \$4, and the present price, \$3 per day, which makes the sum of \$25,564.00, and we have, as the total cost of mining, 9,366 tons, \$76,692.09. As no deduction is made in this estimate for the decrease in the price of mining supplies since 1868, the actual expense of mining this quantity of ore, at the present time, will fall short of this estimate at least 10 or 12 per cent. From the best information we could gain from practical miners in Gilpin county, we think it fair to place the real average cost of mining gold ores at from \$4 to \$6 per ton."

Mr. G. W. Baker has been investigating the merits of the Kean machine for previous concentration of the ores. I would gladly quote at length, but my letter on this subject is already too long, I fear.

#### The Mills.

For information concerning the mills, I must also refer to the papers above-mentioned. The old plan has been to crush over copper plates and blankets, and to concentrate the tailings in sluices. The Bartola pan has been used here very considerably for amalgamating blanket tailings, etc., but is not to be called a very good device. I could say that the machinery of very many mills is decidedly

old-style compared with other places. But I see such a determination to try new ways and the introduction of improvements, that I am afraid that my remarks may be old, before they appear in print. I will, however, speak of some of the mills which I visited.

The BOBTAIL MILL, at Black Hawk, has 20 stamps and 3 large size Bartola pans which grind 600 pounds, in two charges, in 24 hours. Mr. H. Lake kindly showed me through this mill, which works on custom ore in part. The stamps weigh 500 pounds, drops 28 to 30 times per minute and crush 15 tons in 24 hours. The tailings are sold to Hill's smelting works for \$25 to \$30 per ton. The machinery, of good workmanship, was made by the Port Pitt works of Pittsburgh. They have a Stillwell heater, and the engine is 20 horse power. They were, at my visit, working ore for the Bobtail, Fisk and Kansas lodes. That from the latter yielding 7 to 8 ozs. per cord. They use composition copper plates, which they like especially for low-grade ores. I was very much pleased with the management, which is alive to the times and ready to introduce any improvement for saving tailings or working ores.

The Consolidated Bobtail mine has its shaft No. 2 down 530 feet. There are 200 feet of water in the mine. A tunnel is now being run in from Black Hawk to save pumping, etc.

The SENSENDER MILL is superintended by Mr. C. F. Harpin and is at present working on Bobtail ores. It is run by water-power, has 20 stamps and 6 pans, and runs day and night. The FURLETON MILL is also run by water-power. It has 15 stamps. Many other small mills are now at work when water is plenty.

The SMITH & PARMELEE MILL is located at the Gregory lode. The company own 200 feet on this lode and 800 feet on the Briggs. These two veins come near together at the top, but at the lower end of the shaft are 60 to 70 feet apart. The mill has 25 stamps, dropping 36 times per minute and 9 Bartola pans. They run through 3 cords of surface ore or 2 1/2 cords of undecomposed sulphurets. The engine is 75-horse power. The shaft is 600 feet deep, is close to the creek, and is filled with water. The company could make no arrangements with the others higher up on the lode, and as they could not afford to drain other people's mines gratuitously, this is the result.

The BLACK HAWK MILL is the largest in the Territory, I am told. It was built in 1865. They have a 100-horse power engine, and forty stamps weighing 1,000 lbs., and 25 weighing 550 lbs. The heavy stamps drop 16 and the light ones 30 times per minute. It cost the company 19 1/2 cts. per pound for freight from St. Louis, on some 200,000 lbs. of machinery, which adds up to a very pretty sum. They have put up one or two bidders to run by machinery and have had shaking tables, but none of these satisfied them, and they prefer hand-budding. They are running on custom ore, as their mine is not worked at present. Mr. Geo. E. Congdon is the superintendent.

The EMPIRE MILL, owned by Borham & Miller, has a 25-horse power engine and 20 stamps. It runs night and day in Gregory 2d ore, which yields about 8 oz. gold to the cord. In their last 30 days' run they worked 60 cords. The tailings yield about 1 1/2 oz., to the ton and are sold to Hill's smelting works.

The SAULSBURY MILL is owned by Mr. E. L. Saulsbury. The able superintendent, Mr. A. Behr, kindly conducted me through the works. There are 20 500-lb. stamps, dropping from 25 to 30 times per minute, and two pans. They have here a Keith furnace, which is not running, however.

The POLAR STAR MILL has 32 stamps and crushes 24 to 25 tons per day. It has also 8 sets of Chili mills. The owners are Kimber, Garret & Co. The mill runs on custom rock. They use water-power at present. Indeed many of the mills in North Clear Creek gulch use water-power at this season of the year, and steam-power the rest of the time. Water is abundant about 4 months.

#### Boston and Colorado Smelting Works.

I visited the Boston and Colorado Smelting works, which are under the management of Prof. N. B. Hill, who kindly conducted me through the establishment. This was built four years ago and has been running ever since. The assaying department and the technical conduct of the works are under the more immediate supervision of Mr. Herman Beeger (?) who has had an experience of over 25 years in this business.

The grounds occupy an area of 1,000x250 feet. The first place I visited was the de-

partment where men were employed washing ore from the Pewabic lode. This is very clayey and is first concentrated in long sluices and then in jigging machines, of which they have four.

I next went to the mill where the matt produced is crushed and ground, then sifted and sacked for shipment to Swansea. The average shipment is 40 tons per month.

There are three large reverberatory furnaces for smelting, 9x13 feet, with a stack 50 feet high, 3 feet square at the bottom and 2 feet square at the top. The charge is two tons, and is drawn every six hours. Concentrated tailings are bought from the stamp mills and used for fluxing. For these they pay in currency the full value of the gold and silver contained less, \$24.

Previous to smelting the ores are roasted in heaps of 150 to 200 tons each. This operation requires some two months.

This company has some 3,000 tons of ore now on hand. The capital invested is stated to be \$300,000. They employ here 40 men, and 20 more in getting and hauling wood, which averages \$5.50 per cord; 40 cords are said to be burned in 24 hours. The fire brick comes from Golden City.

The works treat only first-class ore. The management has been an eminent success, although all other attempts at smelting made here have failed. The company undoubtedly makes large profits.

#### Blooded Stock at Salt Lake.

[From our Special Correspondent.]

EDS. PRESS:—We have enjoyed a pleasant though "short season," here at Ogden City, mostly among the farmers, who have come in from the Cache Valley and vicinity to attend the grand Mormon jubilee, held annually on the 24th of July, at some place within the Territory where all the officials of the Church—and a portion of "the rest of mankind" congregate to celebrate the incoming of the first great delegation of the Church of Latter Day Saints. In this connection, we desire to notice, briefly, the arrival in this city a day or two since, of Colonel Peter Saxe, the noted eastern dealer in improved breeds of stock.

His cattle are the famous "short-horn" breed, (Durhams) and are twenty-three in number, bulls and heifers. They are thorough-bred, "American Herd Book" register, and are from fourteen to thirty months old; but few of them, however, going beyond sixteen months. They are pure reds, whites, roans, varied, and red and white, the red preponderating. There are also one hundred and sixty head of "thorough-bred" "Cotswold" ewes and rams, the yearlings among which average, it is said, from one hundred and seventy-seven to two hundred pounds weight; their fleeces are also about thirteen pounds; and in length, varying from seven to sixteen inches. The whole of the animals have been purchased from 41 of the best folds in Kentucky.

All of this stock, cattle and sheep reached the terminus at Ogden on Friday evening. The amount of means invested by the gentleman is upwards of seventy thousand dollars; and the Cynthia, Ky., *News* of the 22d ult., in noticing his purchases, says they constitute the largest exportation in number and cost, ever made from that State.

This stock was purchased in the famous stock counties (the "Blue Grass" counties) of Bourbon, Fayette, Scott, Harrison & Clark, making nearly a clean sweep of all the pure-blooded young Cotswold sheep for sale, in the State. The numerous parties by whom the animals were sold gave Colonel Saxe along with each a full and guaranteed pedigree of both sire and dam. It is claimed and conceded by the most experienced breeders in that State that the progeny of the Cotswold stock, bred in Kentucky, are superior in carcass and in the quantity and quality of the fiber of the wool, to those of their sires and dams imported hither from England and Canada. This remarkable fact is attributed to the dry and equable climate of the State, while that of England is damp and variable, and that of Canada is prejudicial, on account of the long and cold winters and often excessively hot summers. The design of Col. Saxe in exporting this fine stock is to increase the carcass and the quantity of the wool of the Mexican breed in California and Oregon.

Col. Saxe sold to Joseph A. Young three of his beautiful short-horn heifers; three of his hulls to Bishop Preston, Geo. L. Farrel, Esq. and Bishop Loren Farr; also some of his fine 200 and 300 pound lambs and sheep to Messrs Jennings and Geo. Q. Cannon, (editor of the *Deseret Daily News*) Bishops Woodruff and Lay-

ton of Salt Lake City; also to Messrs. John S. Smith, Kimball and others, some thirty head in all, in this vicinity.

We congratulate these leading stock men of Utah—who were able and willing to invest so liberally in these splendid animals. Col. Saxe, will start for the golden State—at once with the balance of his extensive fold and herd. We learn that much of it, is already engaged in the vicinity of Petaluma, Sonoma county.

It will be remembered that this gentleman was at our last State Fair, with a fold of these fine Kentucky Cotswolds, and took several of the leading premiums; also at Stockton, San José and Petaluma. This stock being of the first-class, we hope Californians will not allow a hoof of it to pass by to Oregon. Especially as the prices are quite as low as it is sold in Kentucky.

#### Mining About Ogden.

I find that there is some little mining excitement at this place, and some few lodes have been taken up and recorded, with regard to which I have gathered the following from those who appear to be well informed on the matter.

The mines are all located in the Wahsatch range of mountains, and among them have been found several

#### Tin Lodes

Which are located about three miles from the city. One is named the Morning Star, and is owned by Horricks & Co., of Ogden. It is said that this lode averages 20 feet wide at the cropping, and can be traced for some distance. Assays made in St. Louis show that the surface rock will yield 70 pounds of tin to the ton of rock; while at the depth of ten feet it showed a yield of 210 pounds to the ton.

The Star of the West, is another good mine, from some ore from which a small bar of tin was obtained by Parpe & Beessel, assayers of this city. This is represented to be a large and extensive mine, and the owners have sent a large quantity of ore to St. Louis for assay. I hope to get the returns in a short time, when I shall be able to advise you of its value.

Specimens of this ore and the metal taken from it will be sent to the Mechanics' Exhibition in your city. An assay of this ore, here, returned 256 pounds of tin to the ton of ore.

The Unele Sam lode, one mile from this city yielded \$48 in gold and \$26.70 in silver from surface rock, by a late assay. These and some few other locations are the first attempts at mining or prospecting for mines in this part of Utah, the inhabitants of which are not as yet very well versed in prospecting. The Mormons here, say that if gold and silver or tin are to be found in these mountains they wish to be the folks who get it. Heretofore, however, they have given all their attention to farming and gardening. Leaving Ogden, and passing a few miles west I arrived at

#### Brigham City.

Here I also find the Latter Day Saints talking about mining matters, and it is said that the farmers and other good citizens of this hurg have formed an association on the cooperative plan for prospecting. They have already found some very good prospects, and have run a few drifts; but it being now harvest time, they have left the mines and gone to the fields to gather the golden grain. After harvesting is over they will renew their prospecting operations with a good heart. They expect to send a few samples of their minerals to the Exhibition in your city.

#### The New Woolen Mill

Is now in operation, and doing a good business.

#### The Orchards and Gardens, Etc.

The orchards are in full bearing and loaded with fruit—apples, pears, peaches, apricots, etc.; while the gardens are teeming with their produce of vegetables, melons, etc. The fields also look well, as a general thing. The corn is good and so is the wheat and oats, where the grasshoppers have spared them. These insects have been very destructive in some locations; but the "Saints" bear it with a most commendable patience and resignation, saying that God sends destruction first to the "House of the Lord."

Many about here are going largely into the business of stock raising as will be seen by the former part of this communication. We wish the people here the fullest measure of success. They have certainly been very persevering and industrious as is shown by their early presence in this distant mountain valley, and the manner in which they have subdued it from Nature's wildness and solitude, and brought it up to its present high state of cultivation. Yours truly, M.

## MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

### California.

#### ALPINE COUNTY.

**GLOBE MINE.**—*Miner*, July 29th: The Levinthan ore has netted the mine on the dump not far from \$50 per ton. It is used in immense quantities for the amalgamation of free silver ores. The developing of a large body of argentiferous copper in the Globe mine has put it also upon a paying basis. A sample of the first-class ore analyzed by Prof. Rickard yielded as follows:

Gold.....0.001=\$ 5.02  
Silver.....0.043= 18.85

Copper.....67,850=\$23.87  
Iron.....13,500  
Antimony.....2,250  
Sulphur.....20,500  
Alumina.....3,210  
Magnesia.....5,375  
Silica.....18,112  
Loss.....159

100,000

For the copper alone this ore is worth on the dump over \$50 per ton, and the Dayton people offered to contract for 100 tons. The combining of a chimney of ore has been followed for upwards of 80 feet, and in one place a pit was sunk upon it eight feet deep when the vein opened out to three feet of solid ore, and five additional feet of soft ore that will have to be dressed in Cornish style to fit it for market. The present limited development justifies the most sanguine hopes of an immense body of rich ore.

**SILVER GLANCE.**—Ore in small quantities was developed in the raise in this mine this week. The Monitor and North-western mill is in a forward state of completion, and before August shall have passed a stream of bullion will have commenced to flow out of Monitor.

#### BUTTE COUNTY.

**CHEROKEE.**—*Orville Record*, Aug 5th: Four or five hundred men, are now encamped in the vicinity of Cherokee Flat, engaged on the various ditches for bringing water to that locality. The Cherokee company have about one hundred and fifty on the line of their ditch from Butte creek; the Spring Valley Company have about the same number on their works near Conecaw Valley, and Mr. Hendricks has some two hundred on his ditch from the West Branch to Morris Ravine.

#### CALAVERAS COUNTY.

**NEW MILL IN OPERATION.**—*Chronicle*, Aug. 5:—The new first-class mill, Hartigan & Co. proprietors, on the Whisky Slide mine, commenced crushing last week. The battery is composed of ten stamps, a 50-horse power engine furnishing the power. A big "clean up" is expected soon.

**GOOD ROCK.**—Favorable news is received from the "Wolverine" and Railroad Flat. The shaft commenced by the Co. who recently purchased the mine has reached 100 feet, and the lead shows remarkable well throughout the entire distance. Hoisting works, run by steam have recently been placed on the claim. Eighty tons of quartz taken from the shaft unassorted, crushed in Harris' mill at Sandy Gulch, yielded \$25 per ton. H. H. Sheldon is the energetic supt.

#### LOS ANGELES COUNTY.

**BULLION.**—*Los Angeles News*, July 29: Three hundred and twenty-six bars of bullion, weighing in the aggregate 27,493 lbs., were received from Cerro Gordo yesterday. Also 205 bars from the O. L. S. L. Co.'s works same place, and 736 bars from the Union works.

**NEW MINE.**—Parties who have been prospecting say that new mines have been discovered within 75 miles of this city. The ore found is a species of galena, and is said to be very valuable.

**ITEMS.**—Same of 5th:—Eighty sacks of ore from Ivanpah, Clarkedistrict, received. Mines reported as continuing to flourish.

The San Gabriel M. Co. (placer) is reported taking out dirt worth \$3 per pan.

#### NEVADA COUNTY.

**SPLENDID YIELD.**—*Union*, Aug 5th: Wednesday last a clean-up was made at Ben McCauley's mill, Boston Ravine, from rock from the Carhiow ledge, Allison Ranch mine. The proceeds were worth \$1,400 or \$175 a load.

**TOWN TALK MINE.**—*Transcript*, Aug. 4: The Town Talk is a gravel mine about a mile east of Grass Valley. It has been worked for a number of years with profit

and the ground will last an indefinite time, with all the force which can work upon the claims. The gravel is run through a mill, and until the 5th of July last, the mill was driven by water power. Since that date the five stamps of the mill have been run by a steam engine. A clean up was made on Monday and gold to the amount of over \$4,000 was taken out. This gives a profit of over \$100 a day to the owners above expenses.

**OUR YIELD.**—*Gazette*, Aug. 2d: It is said that the yield of all the mines of Nevada county, for the last year, will not fall short of \$7,000,000.

**THE BOWERY MINE.**—*Union*, Aug. 5th: We regret to say that so many difficulties are in the way of the reconstruction of this mine that there is no present prospect of a start up.

**NEVADA QUARTZ MINE.**—*Transcript*, Aug. 2d, says the old Soggs' mine started up yesterday on excellent rock. The parties in charge of the mine found excellent quartz, less than 40 feet from the mill.

**GREEN HORN MINE.**—*Union*, Aug. 6th: The Green Horn Mine is turning out splendid rock. The water supply is so short that milling can not be done. The Green Horn ledge is over three feet in thickness and is sending up ore which will mill, at least, \$30 per ton.

**MINING LOCATIONS.**—*Gazette*, Aug 2d: J. H. Reader and others have located 125 feet by 60 feet each, situated in Allison's Ranch and French Corral Mining District, in Bridgeport Township Nevada county, for mining purposes. Sidney Power & Co. have located for gravel mining purposes 1,000 feet on Bloody Run, in Eureka Township.

#### PLACER COUNTY.

**NEW LOCATION.**—*Herald*, Aug. 5th: Yesterday, Thomas P. Ford & Co. recorded a claim, river and quartz ledge, called the Junction Divide Company's claims. These claims are located at the junction of the North and Middle Forks of the American River, about one and a half miles from here. The locators will immediately commence the development of the claims.

**DILLON MINE.**—*Stars and Stripes*, Aug. 3: Specimens of quartz thickly studded with gold, from the Dillon mine near Rock Creek, have been exhibited to us. We are informed that by working test the returns from this rock run away up into the hundreds of dollars per ton.

**CEDAR LEDGE.**—*Herald*, Aug. 5th: This claim has been worked occasionally for four years. It is now beginning to attract general attention. It is a monster ledge, showing a width of thirty feet, and at five feet from the surface yielded, working test, \$78.38 per ton, and in the same opening, at nine feet from the surface it pays \$240 to the ton. Mr. Nickerson has located a water right in connection with the claim and is making every arrangement for the thorough working of the mine. The claim is located north of Bear River.

**RICH STRIKE.**—*Stars and Stripes*, Aug. 3d: Gold-bearing quartz profusely loaded with free gold, has been struck within the past week both at the Minarica and Cox & Denton mines, about midway between this town and Ophir. We are assured that much of the Minarica rock is as rich as the best that has been taken from the famous Green mine, near by, and that the Cox & Denton ore is scarcely inferior.

**RATTLESNAKE BAR ITEMS.**—*Cor. Stars and Stripes*, Aug. 3d: The North Fork ditch is dry two-thirds of the time, which is a great loss to our miners.... A chunk of amalgam worth \$58 was the result of two days' drifting by one man in J. H. Campbell's claim last week. The Reno claim may be better, it is in the river and the former is in the bank. If the water can be kept in the North Fork ditch I would not change places with the Bald Hill or Ophir quartz districts.

**THE WESKE MINE.**—Turkey Hill paid a little over \$3,300 for the week; about \$500 per day to its owner. Unless the bed-rock commences rising again shortly, weske will perfect necessary appliances for taking advantage of the down grade and getting out fully the usual amount of the rich gravel which shows no signs of diminution in his wonderful claim.

#### SIERRA COUNTY.

**GOOD PROSPECTS.**—*Age*, Aug. 8th: The Primrose lode at Hog Cañon looks splendid and prospects well. It is a good mine, and under present management will soon be on the paying list.

The *Messenger*, 29th says: Helmet & Co., on Goodyear's creek have got their tunnel into gravel which prospects rich.

### Nevada.

#### COPE DISTRICT.

**BULLION SHIPMENT.**—*Independent*, 27th: During July, the shipment of bullion from

Cope district, through Wells, Fargo & Co.'s office, in Elko, amounted to \$15,005.

#### ELY DISTRICT.

**BULLION SHIPPED.**—*Record*, Pioche, Aug. 3d: Wells, Fargo & Co. have shipped since July 29th, \$51,111.89. Shipments for the remainder of the week in the same proportion are promised.

**AMERICAN FLAG.**—A lot of 20 tons of ore shipped and worked some time since milled \$172 per ton, and the bullion was .846 fine. About 100 tons of ore are at present on dump. The proprietors intend to crush no more rock until after the erection of the Stetefeldt furnace in Meadow valley, as they are confident of at least \$300 per ton from the processes used by the Stetefeldt.

**WESTERN EXTENSION, MEADOW VALLEY.** The shaft is at present down 300 ft. On all the five stations ore is in sight, but drifting is being carried on only from the 200 and 300-foot levels. At present raising about five tons of ore per day, with 250 tons on the dump.

**BOWERY.**—Incline shaft down 115 ft. and vertical shaft down 85 ft. The ledge still holds good in both places. But little ore is being taken out at present, as the dumps are full of first-class rock which averages about \$125 by assay. They have on dump at present about 400 tons. It is the intention to erect a whim, etc., at this mine soon. Ore will be sent to the mill for crushing as soon as the present contract on which the mill is now running has been finished.

**PIOCHE.**—Drifting is going on rapidly in the east and west winzes, sunk on the 200-ft. level, and at present 75 ft. in depth. In the west winze stoping is going on, and a large body of first-class ore is being opened up. As soon as the engine for hoisting arrives, sinking of the shaft will be resumed and prospecting pushed ahead with all speed. Ore is being shipped daily to the Chicago mill, in Meadow valley, in sufficient quantities to keep the mill steadily running, and a large amount constantly on hand on the mill dump.

**ALPS.**—Main shaft down 126 ft., and drift from the bottom in 25 ft. In the drift the ledge continues very good, being some three ft. in width. Thirty tons of ore were shipped to the mill last week, the pulp assay of which was \$300. About 100 tons of ore on dump at present. The ledge has been struck in the east shaft, which is down 70 ft.

**CONDOR.**—Shaft down 60 feet. A drift has been run on the ledge 45 ft. from the top, and the indications are that a large body of rich ore will be struck at an early day. About 40 tons on dump which assays on an average \$100 per ton. The mineral in the ledge is about three ft. in width.

**RAYMOND & ELY MINES.**—The Burk shaft is down 270 feet and the Creole shaft 250 ft. Both mines have very favorable indications of good pay ore at these levels. The old backs continue to hold out, and on these alone the usual dividends could be made for some time to come. The feature of these mines during the past week has been the very rich deposit found in the Lightner shaft, of the Panaca ground—ore in large quantities and of the highest grade being struck.

**MEADOW VALLEY.**—The steam hoisting works and engine recently erected at the shaft of No. 3 are working smoothly and giving entire satisfaction. The engine for No. 7 shaft arrived on Friday last and will be in place and ready for work to-morrow (Monday). From 45 to 50 tons of ore are being shipped daily to the mill in Dry Valley, but this amount will be increased to 60 tons as soon as No. 7 engine starts up. The mine is looking fine on the lower levels. Over \$150,000 have been shipped on the July account.

**NIGHTINGALE.**—The new shaft of this mine has been sunk 42 feet. A fine looking body of ore was struck on Thursday last, and the indications of soon striking a large body of rich mineral are exceedingly good.

**EXCELSIOR.**—Shaft 60 feet in depth, with a well defined ledge of solid mineral about one foot in width. Still sinking. About 20 tons of ore on dump, which assays from \$100 to \$2,000 per ton. It is thought the rock will mill an average of \$300 per ton.

**CHAPMAN.**—Down 175 feet and sinking on ledge, which averages two feet in width. Drifting will be commenced on the 1st of August. About 20 tons of ore on dump assaying from \$125 to \$2,500.

#### EUREKA DISTRICT.

**MILLING ROCK.**—*Eureka Sentinel*, July 25:—To-day the owners of the General Lee mine, in this district, ship several tons of fine milling rock to Austin for reduction. They have much more on the dumps. A mill with from 15 to 10 stamps will be in

complete running order within three months from now.

**COMPLETED.**—The sale of the site for the new mill of the Pinto S. M. Co. was completed yesterday. Milling has commenced on the ores now being extracted from the Maryland mine at Pinto.

**THE LATEST RICH STRIKE.**—The Fannie B. mine is situated in N. Y. cañon, one-fourth of a mile from the Roslin Smelting works, and is producing six tons of ore per day, which will average \$300 per ton. Some of the ore has been worked and resulted in a yield of \$480 per ton.

**RICHMOND.**—The yield of bullion, last Monday, by the furnace of the Richmond Co. was 10,688 pounds, of high grade valued at \$2,500.

**PROSPECTING.**—During the last three or four months there has been quite a stir among the prospectors of this district. Many new ledges have been discovered, while old locations, half prospected, have been fully developed into full grown paying ones.

#### HUMBOLDT.

**BULL RUN.**—*Register*, Aug. 5th: The Blue Jacket, Johnson, Ontario and Nevada companies are all taking out large quantities of very rich ore.

**ITEMS.**—*Elko Independent*, July 22d: The company owning the El Dorado is down 60 ft., and has a 5-foot ledge, well-defined and rich.

The Monitor is prosecuting its work upon a 4-foot ledge, well defined and very rich.

The Constitution mine is sinking on the ledge at a depth of 30 ft., with a 3-foot ledge of good ore, some of which assays \$5 per ton.

Pride of the West is down 85 ft.

The Independent Co. has out about 100 tons of high grade ore waiting for the stamps to be put in the upper mill.

The chloriders are still at work. They have made about \$20,000 within the last three months.

**SEMINOLE MINING CO.**—*Silver State*, Aug 5th: They have run a drift from the main tunnel about 70 feet, and from the quartz and mineral found within a few days past the prospects are flattering for a good mine. Once mineral is reached they will have plenty of ground to work. The present level will leave them with about 500 feet working ground above it.

**SACRAMENTO DISTRICT.**—*Llewellyn* mine at a depth of 40 feet the ledge is four feet wide, with an excellent showing of sulphuret ores.

**SEVIER MINES.**—*Reveille*, Austin 31st: A two-stamp quartz mill has been started to test the ores of the Sevier mines. The amount already worked averages \$200 per ton.

**STARTED UP.**—*Reveille*, Aug. 3d: After nearly six weeks, the Manhattan mill started up yesterday with its amalgamating capacity doubled. The supply of ore is abundant. The Citizen's mill is also running.

#### WASHOE.

**SAVAGE MINE, A NEW INCLINE.**—*Virginia Enterprise*, Aug. 2d:—A new incline was commenced in this mine yesterday morning at the 1,300-foot level. The hoisting compartment will be provided with self-dumping cars. When the incline shall have attained a depth equal to 100 feet perpendicular, drifting will be commenced for a new level. The mine has been put into good shape and is yielding exceedingly well. Two new mills, the Pinto and the Nevada, were started up yesterday on ore from the mine.

**BULLION SHIPMENT FOR JULY.**—Same of Aug. 6:—The shipment of bullion from the office of Wells, Fargo & Co. for the month of July, was 527 bars, weighing 37,681 pounds, and worth \$897,471.25. This is \$179,111.24 less than the total shipment for June.

**OPHIR.**—The new section of the Ophir shaft has been sunk twenty feet. The rock is becoming hard, but blasts well.

**ITEMS.**—*G. H. News* Aug. 5th:—The Chollar-Potosi mining Company has today declared a dividend of \$1 per share.

An assessment of \$1.50 per share was levied by the Virginia Consolidated Mining Company on Tuesday last.

Last week there was extracted and shipped to mills from the Crown Point mine 1,471 tons of ore; estimated value \$51,502.85. The Hale & Norcross yielded only 245 tons, yet had nearly 5,000 tons in the dumps. The Savage yielded 1,093 tons assaying, \$32.25 per ton.

#### WHITE PINE.

**IMMENSE STRIKE.**—*White Pine News*, 5th: An immense strike was made last evening on the line of the North Aurora and Ward Beecher mines, in the old Earl shaft, 116 ft. from the surface. We saw some of the ore, and it is nearly pure stuff.

The Great Western mine, on Treasure Hill was sold this morning. Geo. B. Ellery made the sale to an English company. Mr. Bastian brought in, on Monday, to McCullough & Co.'s assay office, 130 ounces of fine bullion, the product of Constitution and Orofino ledges in Sacramento District. The rock was worked at the Piermont company's mill, giving a pulp assay of \$266 per ton.

Arizona.

BRANDSHAW.—Prescott *Miner*, July 22d: From parties just arrived we learn that several companies at work on the Tiger and other prominent lodes were taking out very rich ore. Riggs & Co., at a depth of over 70 ft., had cut across a vein of quartz 24 ft. in thickness, 18 ft. of which, we are assured, was good paying ore. The Discovery Co. were sacking ore worth \$800 or \$1,000 to the ton; may be more, as it was literally covered with pure silver. Recently there was taken from the Tiger a piece weighing 140 pounds, and whose sides were covered with native silver, was hauled out of the shaft, boxed, and will, eventually, reach San Francisco.

A very rich piece of gold quartz from Humbug creek has created some excitement here, and parties have started out for extension claims.

The Del Pasco mill was nearly completed and ready for crushing. May commence Saturday.

Mr. Opydyke showed us, yesterday morning, a huge slab of silver-bearing quartz from the Davis lode, Black Cañon.

MOHAVE COUNTY.—A notable ledge has been discovered near Beale springs, Wallapai District, Mohave county. Jerry Ridgeway, the discoverer, sent this ore to Messrs. Niles and Mix, who had four pounds of it worked, which yielded three ounces of silver and gold, worth four dollars per ounce.

Miners from Nevada were arriving in Wallapai District. Work steadily progressing.

HASSAYAMPA DISTRICT.—Same of 20th: The Davis lode is yielding a deal of rich silver ore.

J. Voshay has been testing the Emma mine, which runs parallel with Groom creek. He has found genuine horn silver. Six pounds of ore treated by milling process, yielded \$4.50, over half in gold. The mine is about six miles south from Prescott.

WALKER DISTRICT.—R. Wood, a placer miner was recently here. He had several ozs. of course gold. One piece weighed \$3. Water, he said, was very scarce, there having fallen but two showers, this summer, up to the time he left. His pay-streak was about ten feet wide; his gravel paid about ten cents to the pan, and had he plenty of water for rocking, he could make two ounces per day. Mr. Pointer, from same district, informs us that Mr. Shelton was taking ore from his Vernon lode that is rich enough to pay \$1,000 to the ton? Other miners were extracting ore and doing a little placer mining.

WEAVER DISTRICT.—John Davis and others lately got from the Columbia lode, in an anastra, \$140 to the ton. They are down upon the ledge some 30 feet, where it is about two feet thick. They mean to continue work. Mr. Groves showed a piece of the ore of a milky color, with several good-sized particles of gold.

It is stated that about fifty tons of "Great Sexton" ore are to be worked at the Vulture mill to test the mine.

WICKENBURG DISTRICT.—The Vulture lode, we learn, is better and healthier than at any previous time. The deepest shaft is now down over 300 ft., and, reports says, water has been struck. The mill is reducing about seventy tons every 24 hours.

THE "KELLY" lode is the newest, richest mining discovery. It assays well—\$150 to the ton, in silver—is three feet wide, and "thick in proportion." It is less than a mile west from Prescott.

Idaho.

The Lewiston *Journal*, of July 15th, congratulates its community on the ground that the extension of agricultural pursuits is likely to improve the comfort and cheapen the cost of mining by lowering the rates of living. It reports mining interests at Elk City as lively, or more than in former years. There are preparations being made to develop the quartz leads in that district.

Silver City *Avantur*, July 25th: Bullion shipped by W. F. & Co. for the week ending yesterday, 15 bars—\$22,378.07.

SOUTH CHARIOT.—Incorporated in S. F. The Co. includes the Peck & Porter mine and War Eagle mill in its property. It is one of the best and most substantial, and as soon as properly developed, handsome dividends will be the order of the day.

"BOISE BASIN BEDROCK FLUMING CO." has been incorporated. Trustees B. M. DuRell, W. B. Noble, G. W. Craft, J. J. Tompkins, D. H. Alderson, J. G. Bryant and W. C. Whitson. The purpose is to construct ditches and flumes in More creek, Elk creek, Grime's creek and Granite creek, in Boise county, Idaho Territory.

PLENTY OF MINING GROUND.—*Salesman*, July 25: There is lots of mining ground in Idaho at present unconsidered, which is destined yet to yield heaps of gold. It lays in out of the way places, difficult of access, and will require capital to bring water upon it before it becomes productive. Of such a kind are the Copeland diggings, in Boise county, where it is said that there are thousands of acres that will pay first rate wages. The Co. which have worked there have made an ounce to the hand per day. Water is scarce.

Gold and silver-bearing quartz of great richness has been discovered in the Backskin mountains, about four hundred miles southeast of Salt Lake City. The Indians are very numerous and hostile there.

Montana.

Deer Lodge Independent, July 28th: A Phillipsburg writer says a 5-stamp battery is erected for the Speckled Trout. The Nevada process of roasting the ore before crushing will be adopted, and it is believed will be a success. A three-stamp battery owned by Wm. Blay & Hugh Bell, has been erected in town for the purpose of working ore from the Franklin lode, owned by Ellery & Cay.

About \$6,000 was taken out out of German Gulch in 10 days.

RED MT.—*New Northwest*, Deer Lodge, July 21st: The Nevins lode cleaned up last week \$1,400. Deer Lodge parties purchased one-third. Nevins and Brannagan own the remainder. The Dixie lode, owned by Dickey & Parks, are running two astras, with a result of \$25 to \$30 per ton. Canovan, Trainor & Wilson on Thursday cleaned up \$400 for five days' run on the old discovery ground. A new streak prospects \$2 per pan, with 3,000 feet of new ground ahead of them. Andrews, McBride & Co. have struck good pay in their old ground below Cooley gulch. Getzler & Maul are making good wages from their claim at the mouth of Horse gulch, and expecting better developments. Only one China company in the camp—at Cooley gulch. The Moose Creek silver mines are looking better than ever, and the Co. are preparing to ship ore to San Francisco for reduction. There is yet plenty of water in Highland.

LINCOLN.—*Herald*, Helena, 20th ult: Last night DeWitt & Stager brought in 230 ozs. gold.

ARGENTA.—*Gazette*: The furnaces, erected by Tootle, Leach & Co., and Messrs. Bohm & Co., and others, are working a complete revolution here, and Beaverhead county is looking up.

BOULDER.—*Independent*: Carr & Co. are making \$20 per day to the hand. Devine & Co. are rigging a wheel, and will shortly attempt to reach bed-rock in the main hauler. From prospects obtained in the gravel it is believed that if bed-rock can be reached it will be found to be rich. McBurney's Chinese gang have not been successful in operating on Lowland gulch. They are making \$1.50 per day upon the same ground that white men had made from \$4.00 to \$4.50 per day.

Utah.

BOTSFOED MINE.—Salt Lake *Tribune*, July 28th: From a statement published in the Salt Lake *Tribune*, it appears that this mine, recently sold to Englishmen by Buel & Bateman, show from 15,000 to 20,000 tons of argenteiferous galena, three tons of which makes a ton of bullion, worth, at Omaha, \$190 a ton, and of which about half the value is profit.

The Utah Smelting and Milling Co., whose works are situated at Eureka, Tintic, by virtue of success, have now on hand about \$15,000 worth of bullion, the partial result of one month's run of the Homans-vill furnaces.

The Denver (Col.) *Tribune* says Col. Buell, of Nevada, now of Salt Lake, was in Omaha yesterday, and informed Dr. Latham that he had just sold the Utah "Bullion" mining property to an English company, headquarters in Boston, for one hundred thousand pounds sterling—five hundred thousand dollars gold—and got his money.

DISCOVERY.—*Corinne Reporter*, July 29: Judge Elliott has just returned from a prospecting tour on the south-west side of Great Salt Lake, and brings with him some fine specimens of ore. He reports that the party, of which he was one, has discovered extensive ledges near a good lake landing, not far distant from the mine.

Mining Stock Market.

[San Francisco Stock and Exchange Board.]

THURSDAY EVE., AUG. 10, 1871.

MISCELLANEOUS STOCKS.

We note sales of San Francisco Gas stock at \$82; North Beach and Mission Railroad at \$55; and Spring Valley Water at \$75 per share. The last-named company disbursed a dividend of 1/2 per cent. on the 10th inst.—The California Trnst Co. will pay a dividend of 1 1/4 per cent. on the 12th inst.—The People's Insurance Co. paid a dividend of 1 per cent. on the 10th.—Pacific Bank stock sold at \$98 per share.

The following quotations have been carefully revised by F. H. Woods, Broker:

MINING SHARE MARKET.

In volume the transactions at the Stock Board show a diminution as compared with the previous week, although in certain prominent Washoe stocks, as well as a number of outside claims, the sales have been large and at an advance. The intrinsic merits of a mine will at times assert themselves, and this causes speculators to work with outsiders, carrying such stocks far beyond their true value; and it is at this juncture that insiders gain the advantage. To operate successfully in the stock arena one must know the inside views; true, occasionally legitimate purchases, without the knowledge of combinations or the merits of the investment, result in large gains, but such instances are rare. Mining interests generally have a very hopeful look, and as our mines are coming under better and still more economical management, which, we are glad to learn from all quarters, is the case, the production of our precious metals will be vastly increased. Recently sales of large gold-mining properties in our State have been effected in London, and still others are upon the market; and we do hope that no disappointments will follow these investments, for they seem to be the forerunners of great prosperity to our State and the entire Pacific slope.

The aggregate sales in the Stock Board, from August 3d to the 9th, inclusive, have been as follows:

200 shares Argenta at \$20 50.	20 shares Alpha at \$8.
15 shares Amador at \$23 1/2.	250 shares Belcher at \$30 1/2.
1450 shares Buckeye at \$1 50/22.	8114 shares Chollar-Potosi at \$33 1/2.
1445 shares Caledonia at \$10 1/2.	555 shares Eureka at \$20 1/2.
3872 shares Eureka Consolidated at \$15 1/2.	594 shares Gould & Curry at \$12 1/2.
2214 shares Golden Quartz at \$20 1/2.	1572 shares Hale Norcross at \$35 1/2.
110 shares Imperial at \$25 1/2.	425 shares Ida Elmore at \$7 1/2.
2040 shares Jackson at \$5 1/2.	212 shares Kentuck at \$10 1/2.
1785 shares Lady Bryan at \$30 1/2.	1120 shares Mahogany at \$7 1/2.
5105 shares Meadow Valley at \$20 1/2.	560 shares Monitor and Magnet at \$7 50.
3728 shares Origin Hidden Treasure at \$7 50.	7317 shares Ophir at \$9 1/2.
25 shares Overman at \$5 1/2.	4086 shares Phoenix at \$2 1/2.
1855 shares Pioche at \$11 50.	600 shares Savage at \$31 50.
40 shares Segregated Belcher at \$7 1/2.	4892 shares Sucker at \$30 1/2.
480 shares Yule Gravel at \$11 1/2.	6012 shares Yellow Jacket at \$30 1/2.
40 shares Crown Point at \$10 1/2.	90 shares Daney at \$3 50.
250 shares Raymond at \$15 1/2.	115 shares Consolidated Virginia at \$5 50.
10 shares Pacific Bank at \$4.	60 shares Sierra Nevada at \$14.
500 shares Nevada at \$5 1/2.	10 shares Bullion at \$30.
26 shares San Francisco Gas at \$82.	20 shares North Beach and Mission R. R. at \$55.
50 shares Spring Valley Water Co. at \$75.	

Amount of sales.....\$1,977,387.

HALE & NORCROSS—sold to a limited extent at fluctuating rates. During the week ending August 5th, 273 1/4 tons of ore were extracted. They have in their dumps 4,916 1/2 tons of ore, of which 3,686 1/2 tons is low grade.—Crown Point is dull at recent figures. On the 6th inst. the 1,000-foot level was 113 feet in length, both levels showing about the same quantity of ore. The winze to connect the 900 and 1,000-levels had attained a depth of 33 feet, the last

few feet running in clay and porphyry. For the week ending August 4th, 1,435 1/2 tons of ore were taken out, showing an estimated value of \$46,325, equal to \$32 50 per ton. A dividend of \$10 per share was disbursed on the 10th inst.—SAVAGE sold moderately at uniform rates. For the week ending August 6th, the ore yield amounted to 656 tons, valued at \$32 50 per ton.—BELCHER sold largely at an advance. On the 6th inst. the incline was 40 feet below the track-floor, and the indications are said to be favorable for finding good ore.

CHOLLAR-POTOSI attracted considerable attention, at well-maintained prices. During the week closing August 5th, 1,067 tons of ore were extracted, valued at \$43 37 per ton. A dividend of \$1 per share was disbursed on the 10th inst. Total amount of bullion for July, \$151,122.—YELLOW JACKET was largely dealt in at uniform rates. A dividend of \$2 50 per share was paid on the 10th.—MEADOW VALLEY shows a total bullion product for July of \$193,000. A dividend of \$1 per share will be paid on the 15th.—RAYMOND & ELY, under the recent purchase of contiguous ground, advanced to \$20 50 per share. The bullion product for July aggregates \$62,000.

MARAVILL COCOA.—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success has been achieved. The Maravilla Cocoa Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For home consumption, the Maravilla Cocoa is sold in packets of one, two, and three ounces, and in tins of one, two, and three pounds. It is also sold in bulk to the trade. Sole Importers, Messrs. Maravilla & Co., 1025-ly, New York, N.Y. Export, Chicago, Ill., and London, England.

### Rice Culture—Leveeing, Ditching, Inundating, Etc.

A knowledge of the mode of cultivating rice in South Carolina may be of use in the culture of a different variety of the grain in another climate, on a different soil, and with another kind of labor. But it may be totally inapplicable.

I know of no essay or article in print, on this subject, which does not presuppose some knowledge of the matter, in order that the reader should understand it. All that I have seen embrace only parts of the subject, and are full of technical terms peculiar to rice planters, or rather rice growers.

I will endeavor to give such an explanation of the mode of preparing lands for the culture of rice, and of the process of cultivation, as may be understood by one to whom the whole matter is new. I have to do it on short notice, and must be necessarily brief, and can furnish but rude drawings and diagrams to assist in explaining what I here write.

The variety of rice cultivated in South Carolina, for market, is called "Gold seed," from the bright golden or yellow color of the husk or chaff, which encloses the kernel or grain, which is of itself a pearly color. Another variety, called "White Rice," differing from the former in the pale straw color of its chaff, and in a greater tendency of the grain to break off from the ear when it is being cut and removed from the field, is also cultivated to a small extent. The White rice is said to have been introduced from Madagascar, and was superseded by the Gold Seed, which is said to have been brought from India.

The rice lands in South Carolina are either tide swamp or inland swamp. My experience is confined to the former.

Rice is chiefly and most successfully cultivated on what are called "tide swamp lands," that is, alluvial lands situated on a river, and so near to its mouth as to afford a rise and fall of the tide not less than three and a half feet at spring tides, and so far from the sea that the water is usually fresh at high water tide, at least during the spring and summer. Between these two points all the alluvial tide lands worth planting in rice are to be found, and the extent of this region up and down this stream, and also its breadth from highland to highland on each side or the alluvial valley of the river, varies with each particular river. The soils of these alluvions also vary greatly. The best have a large proportion of bluish or brownish clay intermixed with and underlying the vegetable mold. That which is black in color, and peaty in its appearance is generally bad, though there are striking exceptions to this remark. A shallow mold with sand underlying it near the surface is always bad.

The crops sown highest up the river are liable to be injured by inundations or freshets; those lowest down the river by the want of fresh water during a drouth, at a season when the plant needs water. Lands situated between these two extremes are the safest and most valuable. A rise and fall of six feet in the tide is advantageous—say at high water on the spring tide, one and a half feet above the level of the alluvial land, that gives height enough to flow the fields, and four and a half feet, at low water, below the level of the land, will allow of good drainage.

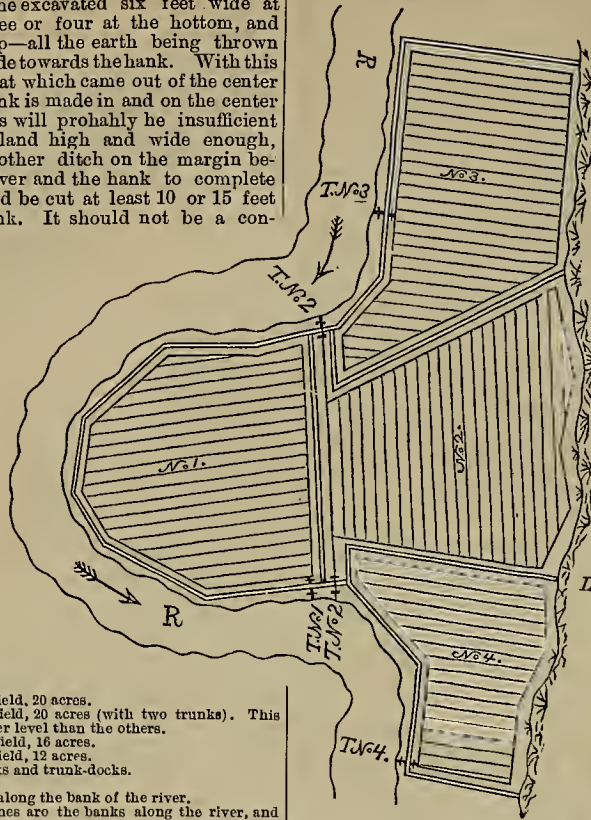

To convert such lands from a state of nature into a rice plantation, or a number of rice fields, requires some skill and much labor, as will be seen by the illustration accompanying this article.

As these lands are subject to be overflowed at high water, at spring tides at least, you must be able to control this overflow, that is permit or prevent it at your pleasure. To do this, the land must be surrounded by a dike or embankment, except where it abuts against adjacent highland. In South Carolina, few rice fields are three feet below the level of the spring tides, and the best are not two below them, so that banks four feet or four and a half feet are sufficiently high.

The dike or hank is made thus: The space it is to occupy is laid out 12 feet wide along the land near the river, leaving a margin of at least 20 feet between it and the river at the points where it approaches it nearest. Along, and in the middle of this space laid out for the bank, a ditch is then excavated three feet wide and three feet deep, the earth being heaped on the side toward the river. This is called a center ditch, and its object is effectually to prevent leaks in and under the future bank in making which the center ditch is filled up, the earth being well packed and rammed into it. Then you lay out another ditch parallel with the course of the hank at about 15 or 20 feet from the inner edge of the hank being next the river. This

ditch must be excavated six feet wide at the top, three or four at the bottom, and five feet deep—all the earth being thrown out on the side towards the hank. With this earth and that which came out of the center ditch the hank is made in and on the center ditch; as this will probably be insufficient to make the land high and wide enough, you cut another ditch on the margin between the river and the hank to complete it. It should be cut at least 10 or 15 feet from the hank. It should not be a con-

FOUR RICE FIELDS.

No. 1—Rice Field, 20 acres.  
No. 2—Rice Field, 20 acres (with two trunks). This field has a lower level than the others.  
No. 3—Rice Field, 16 acres.  
No. 4—Rice Field, 12 acres.  
T J 1, 2, 3, 4—Trunks and trunk-docks.  
R—River.  
L—Highland along the bank of the river.  
The double lines are the banks along the river, and those dividing the fields from each other. The single lines are the ditches running parallel with the hanks. The light parallel lines across the fields are the quarter-drains. This is not the plan of any particular field or by any scale, but merely by the eye to explain what is written.

tinuous ditch so that a stream of water can run through it, but rather a succession of short ditches separated by several feet of unbroken soil between their ends, that they may in time be filled up with soil. The hank and inner ditch run all around the field and inclose it.

But it is necessary not only to be able to keep the water out of the field, but also to have the means of letting it in at high tide or of letting it out at low tide, at your option. For this purpose, a kind of small flood-gate (subterranean flood-gate) is used, called a "trunk." Thus:

A Rice Field Trunk—Side View.

a—Water way, length 25 feet.  
b—Doors.  
c—Ratchets to keep the doors open at any required width.  
d—Bank.

The trunk is a large tube made of wood, put down horizontally under the hank (at some convenient point for draining and flowing) at right angles with the course of the bank. The bottom of this tube, which is the water way of the trench, is about four and a half feet below the level of the surface of the alluvial land, or field. A short but wide and deep ditch called the trunk dock connects the outer end of the trunk with the river, and a similar ditch connects the inner end with the ditch in the field. The trunk being open at both ends, except when the trunk doors close them, the water will flow from the river into the field during flood tide, and out of the field into the river on ebb tide. At each end of the trunk are two posts, one on each side secured to the trunk by a frame work. Attached to the upper end of each pair of

open mouth of the trunk. The door and its arms swing freely on the pivot rod which passes through the tops of the arms also. The ratchet bar attached to the door-arms may be caught on its pin so as to keep the door open, that is, one, two or more feet from the trunk. The water on flood-tide runs into the trunk, the inner door yields easily to the pressure, the ditch is soon filled and the field soon begins to be covered with water. But on the ebb tide, as the water falls in the river, the water in the field attempts to flow out, but the smallest pressure of the returning-water shuts the inner door of the trunk and the water is kept in the field. The next flood tide will put more water in the field

Trunk—Front View.

a—Ratchet pins.  
b—Brace to posts.  
c—Pivot rod.  
d—Water way.

Trunk Door—Detached from Trunk.

a—Door.

c—Pivot rod holes.  
d—Ratchets.

if it is wanted. As both ends of the trunk and both doors are exactly alike, you can reverse the process, and keep the field flowed or drained, at your option.

The trunk is usually put down while you are making the hank, as it is almost immediately useful in keeping the land drained and so facilitating work on it.

#### Description of Trunk.

This trunk consists of two timber sides, each 25 feet long, 18 inches wide and 4 inches thick. They are placed parallel to each other, four feet apart, and are secured to each other by a number of plank 4 feet 8 inches long, fastened to each end by stout wooden pins, to one of the sides, and jointed so as to get closely up to each other; the whole making a strong

Profile of Cross Section of Rice Field, Bank and Ditches.

these posts by a rod which serves as a pivot are two slighter posts or arms. The lower end of these arms (each pair of them), are firmly fastened to a wooden valve or door, which is made to cover and close the

wooden box 25 feet long, 4 feet wide and 18 inches deep in interior capacity, but open at the ends. Over each end of this box, a frame made of 8x4 scantling is closely fitted as seen in the drawing

of the front view of the trunk—the perpendicular parts of the frame being 11 feet long, and forming the posts or uprights on which the trunk and doors are hung. The frame is strongly pinned on to the trunk and over hangs the length of the trunk a ½ inch, that the trunk door may shut flush or level against the frame and be almost water-tight when closed.

With a good rise and fall of tide, such a trunk will serve a level rice field of from 12 to 20 acres, flowing in two tides, and draining in the interval.

[Concluded next week.]

**NEW VARIETY OF ORANGES.**—The *News* says that of the dozen Chucipa orange trees imported some months by Captain Clarke, but four are growing, though they are thrifty and beyond danger. Of the package of a thousand seeds received but twenty have germinated. An experiment undertaken at so much expense should have succeeded better. However, it is now certain that the new variety has been successfully introduced. A number of trees from Florida have been ordered by Capt. Clarke, and will be received within a few week's time.

**WHEAT IN THE RED HILLS.**—W. W. Owens of Coon Hollow, El Dorado county, last fall put in three acres of barley and one of wheat on a piece of ground nearly on the top of Hangtown hill, and in harvesting finds the yield extraordinary, considering the location, being nearly on the top of one the gravel and cement hills. The three acres of barley turned out nearly one hundred bushels, and the wheat of the "white club" variety nearly thirty bushels. [We have accidentally overlooked the credit for the above items from El Dorado.—Ed.]

#### Influence of Climate on Vegetation.

It is not alone the exterior appearance of plants which climate alters, it has a distinct action on the chemical compounds of vegetables. Dr. Darwin says the chemical qualities, odors and tissues of plants, are often modified by climate in a manner which seems to us extraordinary, and it is remarkable, because it might have been thought that definite chemical compounds would have been little liable to change either in quantity or quality. The hemlock yields no cocaine in Scotland, the *Aconitum nappellus* becomes innocuous in frigid climates. The rhuah flourishes in this country but does not produce those medical substances which make the plant so useful when grown in its own country. The China tree grows well in the west of England, amazingly so in South Carolina; in neither case is theine yielded. The wood of the American locust tree in England is worthless as that of oak (*Quercus robur*) grown at the Cape of Good Hope, or is the Tasmanian gum tree grown in the vicinity of Melbourne. Dr. Falconer says, there is a great difference in the fibre of the hemp, in the quantity of the oil in the seeds of

the linum, and of morphine in the poppy, when these plants are cultivated on the plains or in the mountains of India. The same species of cactus has been carried from Canton, Manilla, Mauritius, and from the hot-houses of Kew. They were all alike in appearance, but the cochineal insect thrives only on the native plant, on which it thrives prodigiously. Monsieur Berthier says, if we compare amongst themselves the ashes of wood grown on land of different kinds it is seen they differ remarkably, which seems to establish the fact that climate has an influence on their constitution. These examples are pertinent, so far as they go, to show how comprehensive and complete must all circumstances be to bring a plant up to its maximum state.

**RAILSTONE—A NEW MINERAL.**—Prof Brush describes, in the *Amer. Jour. of Science*, for July, a new mineral from Greenland. The crystals are octahedral, often very minute, colorless to white; hardness 4.5; sp. gravity, 2.4. The planes of the octahedron are often tinged yellow, and often dull and iridescent from an excessively thin film of iron oxide. It is essentially a hydrous fluoride of aluminum with probably a small amount of calcium and sodium.

The Central Pacific Railroad has just manufactured a new railroad postal car of very convenient construction.

## USEFUL INFORMATION.

### Electricity in the Human Body.

Mr. C. Varley the well known English electrician in speaking of the supposed production of electricity by the living human body, says the sparks produced by combining the hair, by drawing off silk stockings, or by rubbing the feet on the carpet, are illustrations of frictional electricity, which in no way depend on vitality, but are due solely to the proper conditions in the substances rubbed together and the atmosphere. He then comments on another form of supposed bodily electrification, which has led many people to suppose that the brain was an electrical battery, sending electricity through the nerves to contract the muscles, and which may be produced as follows: The terminals of a very sensitive galvanometer are connected each with a separate basin of water. If the hands be then placed one in each basin, on compressing one hand, violently, a positive current is almost always found to flow from that hand, through the galvanometer, to the other hand which is not compressed. By dipping one hand in water, slightly acidulated with nitric acid and the other in a solution of ammonia, and then washing both in water, and compressing either hand, produced a sensible current. Placing both hands in water and dropping a little nitric acid on one, a current is instantly generated without muscular exertion.

These and other similar experiments have led Mr. Varley to the conclusion that no electricity exists either in or upon the body—either as a source of motive power, or otherwise. The phenomena presented he considers due to the different chemical conditions in which the muscles or their parts are placed. In the case of muscular compression, the action was induced by thus forcing perspiration from the pores.

### Science and Patience.

Most people labor for the day or year, or at the most for a life time—having no thought beyond their own comfort and convenience, and the accumulation of sufficient means to render the family surviving them comfortable, according to their sphere. How different with the statesman or man of science. The former looks forward to the needs of the future and distant ages for the basis on which to found his action; working out his deep and intricate problems of political economy with a patience and forecast of which the mere man of to-day can form no adequate conception.

But how infinitely more distant are the expected results of the labors of some men of science. Take the astronomer for instance, and see what he is doing with his telescope.

One of the largest telescopes in the world is owned by the Chicago University. The distinct work of this instrument is to make, in connection with nine chief observatories of Europe and America, an entirely new catalogue of two hundred and fifty thousand stars, determining the exact position of each particular star, so that the astronomers of some far distant age, many thousands of years to come, perhaps, may by again ascertaining their positions, be able to determine therefrom their various motions, and so authoritatively declare in what direction they have proceeded through the illuminated voids. At this moment men are slowly and patiently performing this sublime work, and furnishing those far-off astronomers the data upon which to base their calculations respecting that mighty problem, the direct motion of the sun through space.

### A Vegetable Wool.

The name of vegetable wool is applied to a fibrous material obtained from the leaves of the fir, a manufactory for this purpose having been established near Breslan, in Silesia. The species of pine thus operated upon is the pinus sylvestris, or wild pine, and it would seem that every member of the pine tribe might be turned to similar account. The leaves of these trees on examination will be found to be made up of a fibrous material held together by a resinous substance. The latter may be dissolved out by means of alkalies, leaving the woolly matter behind. Coverlets, blankets, and other articles made of vegetable wool are in use in Austria, and especially in the public institutions of Vienna. The material is warm, durable, and in all respects agreeable; moreover, it possesses the excellent quality of preserving a certain balsamic and decidedly wholesome smell, which nevertheless is so inimical to insects that they never harbor in it, as they do in almost all the ordinary descriptions of the bed material. The resinous matter holding the woolly fibres together—and which is eliminated or dissolved out by the alkalies—is also turned to account, medicinal baths being made with it as a basis, and which are found to be useful in various chronic diseases.

**NOVEL MODE OF SAVING CANDLES.**—The American Artisan says: A recent traveler in Mexico was much astonished at seeing the men who carry the ore come out of the mine each with one eye shut. The foreman, seeing his surprise, explained the matter. He said the candles belonging to the *tarateros* (who drill and blast), are so cheaply made that they do not give sufficient light in the drifts, where it is consequently quite dark, but where, nevertheless, the *tarateros* see well enough not to run their heads against the rocks. But on emerging into daylight they would be blinded did they not take precautionary measures. For this reason, as soon as they approach the mouth of the shaft, at the point where they catch the first glimpse of light, they drop the eyelid of one eye, and keep this down while discharging their ore, and until they have descended the shaft. When they are again in the dark, they open the eye kept hitherto in reserve, and at once they see everything distinctly; while the other eye previously open and blinded somewhat by the daylight perceives nothing at all.

**HOW SNAKES RUN.**—Snakes have scales on their under surface which they can slightly raise. These serve to take hold upon the ground or whatever surface they crawl over. Moreover, their progress is made by means of lateral motion or by wriggling, thus bending the body rapidly and instantly straightening it, holding on to the ground meantime by the scales they make rapid progress. If a snake be watched, he will be seen to hold on by the scales near the head and draw up the body into lateral curves; then holding on to the ground by the scales near the tail and straightening the curves the head is pushed forward. As this process is generally too rapidly performed to be distinctly recognized by the observer, the snake's progress seems a mystery; but where one has an opportunity to observe the snake when he moves very slowly, the whole process becomes plain.

**MECHANICS.**—The day has been when he called a mechanic was to be called a second-class man—was to occupy a lower seat at the feast—and scarcely any but poor men's children were apprenticed to learn mechanical pursuits; and how often have we heard the expression uttered by way of censure and reproach "Oh! he is only a mechanic!" and to follow a mechanical pursuit for a livelihood was considered derogatory to refined society. How different now to what it was then. Then men's worth and merits were tested by the length of their purse. These measures have had their day and gone. The cry now is "for mechanical muscle and brain" all over the country. Ingenious mechanism is a loadstone that unerringly attracts to greatness, glory and renown.

**THE RANGE OF HUMAN KNOWLEDGE HAS INCREASED SO ENORMOUSLY, THAT NO BRAIN CAN GRAPPLE WITH IT; AND THE MAN WHO WOULD KNOW ONE THING WELL, MUST HAVE THE COURAGE TO BE IGNORANT OF A THOUSAND OTHER THINGS, ATTRACTING OR INVITING.**

**PROGRESS.**—Since the introduction of railroads in India, the wealthy Hindoos go on their religious pilgrimages in cushioned cars, over ground which their ancestors traveled on foot, with peas in their shoes.

## GOOD HEALTH.

### Cundurango—The New Cancer Cure.

A plant called the cundurango has been discovered in Ecuador, South America, which is said to be a specific cure for cancer. No discovery in the medical world could be received with greater rejoicing—a cure for consumption, perhaps, excepted—than the new cancer remedy; for while cancers are less frequently met with than consumption, they present a certain, lingering death in its most awful form, and they are, moreover, to a greater or less extent hereditary.

#### Its Discovery.

The history of the discovery of the wonderful qualities of the plant is, as usual with specifics in general, curious enough. It is said that a short time since the ignorant wife of an Indian laborer, finding her husband suffering from what was there called cancer, and incurable, thought it best to put him out of misery by giving him the seeds of the cundurango, (which are really poisonous), but not finding the plant in seed, gave him a decoction of it, but instead of killing him it cured the disease, and rewarded at once the benevolent intentions of the wife and benefitted mankind.

#### Its Introduction in Peru.

From this circumstance, we are told, attention was first called to this wonderful specific, and now the doctors generally throughout Peru are loud in its praises, though it is claimed to have been tried in some localities without producing any remarkable effects in the disease for which it is offered as a specific.

#### Its Introduction in the U. S. States.

Some three months ago the State Department at Washington received a few pounds of this plant from the Government of Ecuador, which remained unnoticed until Dr. Bliss, of Washington City, began to use it in his practice, and with such satisfactory results that he has issued a circular in which he details his experience.

#### Remarkable Instance of Success.

He says that in the case of Mrs. Matthews, Vice-President Colfax's mother, who was afflicted with cancer of the breast, far advanced in its course, with secondary cancerous deposits, the constitutional and local symptoms as well as the typical symptoms of blood-poisoning yielded and finally disappeared under a treatment of twenty-six days. In other cases presenting the various forms of cancer, a rapid progress was made toward recovery by the administration of the cundurango. Dr. Bliss says that from the experiments which he has made with the remedy and the reliable information received from other members of the profession who have thoroughly tested its virtues, he is convinced that it is the most powerful *alterative* ever in the hands of the profession, and that it possesses a specific influence over the poison of cancer. He considers the cundurango as reliable a specific in cancer, scrofula and other blood diseases, as cinchona and its alkaloid have proved to be in zymotic diseases. This positive testimony from Dr. Bliss will be hailed with delight by the thousands who are suffering with cancer.

The Vice-President, Mr. Colfax, has written a letter, which has been published, fully corroborating the statements of Dr. Bliss, with regard to the results of its use in the case of his mother, Mrs. Matthews.

#### How it Acts.

In the above mentioned letter Mr. Colfax writes: "How it cures or effects cancer I cannot imagine. I know how incredulous many doctors are about it, and I would be, too, if I had not seen its results. It seems to separate from the blood whatever it is that causes cancer, and I don't know what that is any more than I know why Peruvian bark cures ague. You can tell your friends, however, when they obtain it, they will notice on the fourth day an improvement, and by the ninth day they will see themselves that the cancer is going away—that is, if it acts with them as with cases I have seen."

#### Mode of Administering It.

The mode of administering the plant is very simple, being merely steeped in boiling water, and the infusion taken internally.

**The Supply Exhausted—An Agent Gone to Procure More.**

The results of the use of this wonderful specific having been so satisfactory, the small supply originally received was soon exhausted, and as Mr. Colfax says, in another portion of the above letter, I have most piteous appeals for it from friends,

offering hundreds for it if it will only stop the growth of the terrible disease; but I have not an iota, and I guess all in the United States is now used up.

Under these circumstances, Dr. Keene, the partner of Dr. Bliss was dispatched to Peru, via Panama, to examine farther into its use in that country and to obtain a supply for this country.

#### The Difficulties in the Way.

Letters have been received from the Doctor in which he states that he found it more difficult to obtain than was expected. The roads to the Laja district are rough and unfrequented, the streams are swollen and dangerous to cross, and the Indians are disposed to throw every obstacle in the way of foreigners, of whom they are deeply jealous and suspicious. However, when he wrote he was on the point of starting for the interior, and was confident of procuring a supply in season for it to reach New York early in August.

#### All Europe After It.

Dr. Keene found that orders for cundurango had been received at Guayaquil from persons in England, France, Italy and other countries, to the Governments of which the Government of Ecuador had furnished samples. None of these orders had been filled.

#### The Habitat of the Plant.

This plant is said to grow in the most inaccessible altitudes of Ecuador, in localities where no beasts of burden can be taken; hence it has to be collected by Indians and packed upon their backs down the mountains to a point which animals can reach, where it will be packed on mules and so transported to the sea coast.

When the announcement of the wonderful virtues of this plant were first made known, it was supposed to be some experiment of quackery; but experience in high quarters appears now to have changed the current of opinion. Whatever may be the virtues of this plant, certain it is, that nothing in the history of medicine has ever before taken such a sudden and wonderful hold upon the minds of men. It is also attracting quite as much attention in Europe as in this country.

#### An Early Supply Expected.

The latest letters from Dr. Bliss seem to warrant the conclusion that he will be able to land a good supply in New York by the 15th of the present month—August.

#### Another Agent Sent Out.

We may add that as soon as Dr. Bliss learned the difficulties which his partner would have to encounter, and in view of the importance of the mission, he promptly arranged with Ex-Governor L. L. Gibbs, of Idaho, who left New York some three weeks since for Ecuador, to render every assistance which Dr. Keene might need in his undertaking. We shall watch with interest for further developments in this matter, and report progress, as fast as developed.

### Iced Water.

During the hot season the excessive use of iced water is one of the most prolific sources of disease and sudden death. In very hot weather, when water is rendered extremely cold by the use of ice in the cooler, no person should drink it in that condition, but should pour in, or draw from the hydrant, as much water of the ordinary temperature as will modify the iced water to about an October temperature. Then he may drink without damage.

Nothing is worse for the teeth than extremely cold water; and many a man has acquired dyspepsia by its bad effect upon the stomach. Not a few have suffered from congestions which were dangerous or deadly. We remember a boy, smart, black-eyed, and handsome, who was connected with our office. He was just old enough to be wise above that which is written. Being one day remonstrated with for drinking two or three glasses of water as cold as ice could make it, he replied tartly, "Water is never too cold for me; I never feel the slightest injury from its use." The weather was extremely hot, and if ever cold water could be used at any time, that, of all others, when the system was overheated, was not the time to use it so copiously. The next day he was not in the office, and the following day he did not come. The third day about noon he made his appearance, and looked as if he had had chills and fever for three months. He drank no more iced water that summer, and probably got a lesson which will last him his lifetime. It is a wonder it did not kill him. A word to the wise is sufficient. *Herald of Health.*

## Important Railroad Sale.

The Central Pacific Railroad Co. has finally bought out the California Pacific lines of road from Vallejo to Sacramento, Marysville and Calistoga, as also the line from Donahue to Healdsburg, together with all the boats formerly belonging to the California Steam Navigation Company. This sale places in the hands of the Central Company nearly every mile of railroad in the State. It is said to be the intention of the company to lay a double track between Sacramento and Vallejo.

This purchase leaves the company free to decide upon the question of its permanent terminus, without any reference to competing lines. What that decision will be is perhaps as difficult to conjecture now as ever. Judging from apparent preparations, however, and the large amount of money invested in city front property in Oakland, there is but little doubt but that city will continue to be the principal freight terminus, at least. The machine shops of the company will no doubt be located there permanently; neither can we doubt but that this city will eventually become the real terminus of the road, by means of a bridge spanning the bay from Alameda.

We trust and have reason to believe that this transfer will lead to the early completion of the roads already projected or in process of construction by the California Pacific Company. It is also believed that the Central Company will manage the immense interest, now in their sole possession, for the general good and prosperity of the State; for aside from patriotic considerations, there is no other way in which they can so effectually subserve their own interests.

THANK YOU.—Some one has sent us a nice box of pears from San José, prepaying the expressage, contrary to all ordinary custom.

## New Mode of Constructing Flour Mills.

On a table, near the engine at the Pavilion, may be seen a model of a curious looking structure, which very naturally excites the enquiry of all beholders. Probably not one of all the thousands who will visit the Pavilion, will be able to form any idea of the use for which such a structure can be intended—so entirely unlike is it to everything of the kind which has preceded it. It is a model for a flour mill, and one which is so novel in construction, and at the same time so superior in its arrangements for the purpose intended, that a patent for the same has been applied for through the agency connected with this office.

Before making any further reference, it may be proper to state that the inventor, Mr. Derville Bequette has been for many years a practical miller and millwright, having superintended the construction of a large number of flour mills, both here and in the Atlantic States. The model there exhibited is the result of his long experience, both in running and building mills.

Every miller understands the necessity of strength, and proportion and arrangements of parts in the construction of a flour mill—strength to sustain vast weights of grain and capacity for taking up or resisting the jar of the machinery. A mill house should have six stories, in order to place the machinery properly, and so as to do the work to the best advantage. In calculating the area of these rooms for the most economical performance of work, where there is no necessity for largely economizing in ground room, it will be found that if we start with a ground floor of 110 feet square, the second story should be 90 feet square, the third 70, the fourth 50, the fifth 30, and the sixth or top story, 10 feet square—on the top of which latter should be placed a water tank.

The moving power is placed in the center of the first floor, directly connected with which is the lower main upright shaft, which tapers off with every story or connection, until it reaches the upper. The stones are placed in a circle on the second floor, and belted from the main drum on the upright shaft on the first floor, the shaft tapering off according to the decrease of power required to drive the lighter machinery above.

This construction and form of rooms admits of the most perfect arrangement of motive power, driving, and line shafting and machinery, for carrying on all the various operations of elevating, moving grain and flour from place to place and operating the stones. The dimensions given are for eight runs of stones; and the structure can be made larger or smaller, according to the greater or less number of stones which it is desired to operate.

By this arrangement the inventor is fully assured that the cost of constructing a mill may be reduced one-third over the best constructed mills now in use; while an equally large percentage of saving can be made in the daily expense of operating the same, by reducing the amount of friction and extra labor required by the present mode of construction and arrangement of machinery. If the anticipations of the inventor are realized, and we see no reason why they may not be, at least in a great degree, this improvement and saving in the cost of the manufacture of the great staple of life, may well be regarded as an important step in the material and mechanical progress of the day. We shall have something farther to say of the construction and operation of such a mill as here proposed, next week.

A THOUSAND STOLEN SHEEP were recovered recently by Sheriff Morse of Alameda, and the two thieves with them who thought they were safely concealed in the mountains.

## Opening of the Institute Fair.

The eighth Fair of the Mechanics' Institute of this city was inaugurated on Tuesday with appropriate ceremonies, and in the presence of a large assemblage of people.

The proceedings were opened by some well timed and exceedingly appropriate remarks by Mr. A. S. Hallidis, the President of the Institute. The opening address was pronounced by Hon. Milton S. Latham, and was a production in every way worthy of that distinguished citizen and orator. The exercises were charmed and enlivened by vocal music from a delegation of some 300 young ladies from the Denman school, accompanied by dulcet notes from Schmidt & Schlott's band, and rendered impressive by an eloquent and most appropriate invocation from Rev. John Hemphill.

The area of the Pavilion has been enlarged since the last exhibition by the addition of about 20,000 square feet on the ground floor—making, as it now stands, a total of 100,000 feet. The decorations are similar in character to those employed two years ago; but arranged in greater profusion and with more taste.

The present exhibition, though as yet but imperfectly presented, by reason of the tardiness of exhibitors, already shows a marked degree of progress in the industries of the Pacific coast. It partakes much more of an International character than any which preceded it, and is eminently suggestive of the new and important features in commerce which the settlement of the Pacific coast is so surely developing in our relations to the Orient. The Australian colonies are well represented, and so are China and Japan—particularly the latter. Mexico also puts in an appearance.

The Bay District Horticultural Society makes its first exhibit this year in connection with the Institute, and occupies the extensive addition which has been made to the south wing. This addition, which has not been floored over, and is roofed with canvass only, has been laid out as a charming garden, with walks, flower-beds, statuary, fountains and arbors. The display includes a wide and most interesting variety of plants, shrubs and trees, of tropical, semi-tropical and temperate climates—such a collection as could scarce anywhere else in the world be found outside of California. This department, though not yet quite ready, exhibits a high degree of taste, a large amount of labor, and cannot fail to prove one of the most interesting attractions of the fair.

The north wing of the building, which has been greatly enlarged, is, as on previous occasions, devoted to agriculture and machinery. Fred. Brown, formerly of the Central Pacific Railroad, is chief engineer in this department, with Mr. D. W. Macey as assistant.

Our Oriental neighbors, who have contributed so generously and added so much to the interest of the exhibition, have been allotted ample space, specially prepared in the northern addition to the Pavilion. The presence in this city of the chief of the Agricultural Department of Japan, a high dignitary at home, and an accomplished citizen of the Orient, accompanied by his suite, will add much to the interest and profit of this portion of the exhibition, and is rendering important assistance in the more perfect arrangement thereof. The Institute and the public is largely indebted to Mr. Horace D. Dunn in securing this important and instructive addition to the Fair.

The Pavilion is still a busy scene of preparation—many of the exhibitors, to their own loss, and to the annoyance and injustice to the Directors of this Institute, and the public generally, will be actively engaged for the entire balance of the week in preparing and arranging their several stands.

## The McGarrahan Claim.

A decision has been arrived at in regard to the McGarrahan and New Idria Mining Company case. The Secretary of the Interior has decided that neither party has a legal right to the disputed territory, but that the whole still remains with the government.

According to the despatches sent, a complete history of this case has been made, and a most searching investigation, whereby "new and material evidence was discovered."

The only trouble, but decidedly a most serious one, is that this only renews the dispute, and prepares it for trial before Congress, whither, it is said, it will go in all probability. This will be excellent for politicians, but, we fear, rather derogatory to our dignity as a people. However, we will not anticipate trouble, although previous action has been surrounded with as many suspicious circumstances.

## The Diamond Drill at Smartsville.

There being much enquiry as to the success of the diamond drill, we take pleasure in saying that it is doing well in J. P. Pierce's tunnel, at Smartsville, having made 24 feet headway during the last eight days, with a face of 6x9 ft. of hard rock, with one set of hands only. Three shifts, working by hand, formerly made only five feet per week in this tunnel. The machine accomplished 18 ft. by the use of 66 lbs. of giant powder with only 86 holes averaging 4½ ft. This is the work of the California improved machine, constructed under the superintendence of N. W. Robinson for Messrs. Severance and Holt. It is operated by H. Morse and Mr. Green. Familiarity with the operation of the drill enables the workmen to facilitate its operation and still greater speed may yet be attained. We are glad to note this evidence of its success.

## Laying Fumes of Giant Powder.

We last week published the specifications and claims for a method of laying the fumes of giant powder, recently invented by Dr. Blatchly, of this city. Since then we have had the following letter placed in our hands, which affords the most conclusive proof of the efficiency of this invention for the purpose intended.

DR. A. BLATCHLY.—Dear Sir:—The employment of a spray of water, after making a blast with giant powder for laying the fumes as suggested by you and which I learn has been secured by Letters Patent granted to you, has been most successfully used in the Daney mine, near Silver City, Nevada. The effect of the spray is to immediately disperse or rather precipitate the fumes which produce such injurious effects upon the men, and leave this mine in a perfectly healthy and agreeable condition, immediately after each blast.

To mine owners who employ giant, Hercules or other blasting powder yielding nitrous fumes I consider your invention invaluable. The workmen at the Daney mine were quitting work on account of the effect of the fumes until you suggested the spray, after which they went to work and have found no fault since. I would not work a mine without it.

Respectfully, etc., JOHN WHITE.

Formerly Supt. Daney Mine.

San Francisco, Aug. 2, 1871.

RICE CULTIVATION.—We have placed upon another page of the present issue an interesting article on the mode of Rice Culture and the preparation of the ground therefor, practiced in South Carolina. The article appeared originally in the California Rural Home Journal, a paper now discontinued. The article will be concluded next week, and will be found a most invaluable aid to those who may be thinking to engage in that business in California, where we have thousands of acres quite as well fitted for it as any in the Carolinas.

A New Work on Mining Engineering.

A book, named the *Explorers', Miners', and Metallurgists' Companion*, by J. S. Phillips, of this city, is now in press, and will be issued in six or eight weeks by Dewey & Co. It is intended as a practical guide (or companion) for miners in searching for, extracting and treating the ores of the precious metals. It is not intended as a theoretical treatise, but as a book for every day practice; and it will supply a need felt by every practical miner on the coast.

The first part of the book treats of Geology and Mineralogy, to which subjects 98 pages are devoted. The 2d part, on Exploration, extends to the 118th page. Part 3d, Assaying and Discrimination, extends to the 348th page. Part 4th, Mining and Engineering is already printed to the 432d page, and is half finished. Part 5th, Metallurgy, will extend the book to nearly 600 pages. It will thus be seen that the scope of the work is large. The minutiae of the various processes are carefully given. To compress all this into the book, only those processes, machines, etc., are given which are the best adapted to the wants of the Pacific coast.

From the proofs of the last few pages printed we give extracts so as to show the general style of the book, although these do not do the work full justice.

Arrangement of Mechanical Appliances.

Next to that of finding a good mine, there is nothing more difficult, in the whole field of mining, than the arrangement of the mechanical appliances in the best manner for the development and most profitable realization of whatever the veins may contain; and yet this part has been very often disregarded in planting the surface mechanisms, more particularly in the initial stages of operations, as the almost general rule has been to entirely destroy the early erections, to make room for several superseding powers which follow, from the hand "windlass" to the single or double-horse "whipsaw," to the "horse-whim," to the "steam-whim," and the "steam capstan." So, also, it as frequently happens that the smaller engines and pumps are followed by larger ones, for pumping, etc.; so that by the time the wrecks from alterations and substitutions are cleared away, and the consequent delays are paid for, little will be left for making profits, even from mines that would have been, with fair play, profitable.

Mills and stamps also are very often obtained too soon, before it is known if they will be really wanted; therefore, they are either not required, or are insufficient for the quantity of mineral to be treated; so that, *firstly*, the outlay could have been entirely saved; and, *lastly*, the double erection, with its consequent destructive waste, would have been likewise prevented, and so much larger profits given.

Therefore, all these things should be well considered about this time, and a provisional intention for the future should pervade the whole system of mechanisms and mining, instead of the most stolid disregard that is often shown towards all agreement with the subsequent erections and excavations that are naturally to follow.

The Best Pumping Machine.

"The Pacific slope is destined to become an extensive mining field; each year will deepen the developments of mineral veins, and the difficulties of pumping water and hoisting stuff therefrom will geometrically increase as depth is attained; so that many mines will waste their proceeds, and succumb for want of mechanical appliances for deep mining. It is therefore imperatively necessary that you should profit by the experience of others, and discard those non-expansive rotary engines,

that are entirely unsuited for pumping water from deep mines, from imperfection of structure and extravagance of fuel; or continuously recurring difficulties and accidents will have to be encountered, and these temporary machines discarded for the more appropriate, substantial, and permanent pumping engine, at a time, when, from excessive water and concomitant expense incurred by delay of operations under full staff, the cure of the evil will cost far more than the prevention.

It is not uncommon in mines from 1,500 to 2,500 feet deep, that pumps of from fifteen to twenty inches in diameter, varying from eight to ten feet stroke, are required, where the quantity of water is so excessive that a hindrance of twenty-four hours would be extremely ruinous to the financial balance; so that nothing but the most efficient arrangements can secure continued and successful labor, with economy. The experience of Cornwall in this department is more valuable than that of all the outside world. I will therefore endeavor to describe the "Cornish Pumping Engine," which I deem vastly superior to all others for pumping, and hope it may be adopted here as elsewhere, before it is too late; as it is equally well suited for all stages of mining, intervening between the discontinuance of the "horse-whim" harrel, and the deepest developments of man;

SURFACE MACHINERY ARRANGED FOR PUMPING, HOISTING, AND CAPSTAN WORKS.

saving, as it does in every way, from its admirable adaptation to the work, not only in fuel, and in wear and tear, but also by less breakages, hindrances, and consequent loss of mines. This engine, contrived especially for pumping water from deep mines, by several of the best engineers in the world, is exceedingly well adapted for the purpose; in fact, it is for the miner what the direct-acting steam hammer is for the blacksmith, and performs with ease and precision duties that could not be otherwise accomplished; and therefore embodies many peculiarities." \* \* \*

The Steam Capstan.

"The steam capstan is almost a necessity for deep and extensive mines, as the hand capstan is not only too slow in action, but also too expensive, as it requires so many men to work it, when heavy weights have to be lowered or elevated great distances.

It has been the practice to employ an especial engine for this purpose; but the arrangement shown in the cut, for the surface mechanisms, simplifies and cheapens the initial stages of mining, so that one thing shall follow another, without destroying the old arrangement of parts to make room for the new; and, in this connection, the double cylinder, expansive action hoisting engine performs both duties, by merely disconnecting, by an easy arrangement of motion, the hoisting or capstan gear, as required. The other peculiarities will be described in the chapter on "Deep Mining, as Facilitated by such Machines." The steam capstan is shown, in the act of hoisting a piece of main rod, with the side "strapping" or connecting plates attached, for greater facility in connection, when lowered to its place under the other rods.

You will notice that peculiarity of the shears, where the sheave is so fixed that the rope works outside, instead of underneath in the usual manner, by which the rod may be hoisted to the very lashing, so that a much less height of shears will suffice.

In this arrangement, the pumping engine and the hoisting engine are at right angles with the vein; the former is on the foot-wall side, and the balance beam is towards the vein, and intentionally placed in the direction where, in the future working, a pumping rod may be required."

Queries for Mechanics.

EDITOR'S PRESS:—Perhaps the following queries (if you see fit to publish them) may set many people to thinking. Perhaps they may do some good, perhaps not a whit:

Why does Mr. King and nine-tenths of all the screw-plate makers make the opening to receive the die at the same side or end of the plate that the die is used? thereby rendering the tool very troublesome after it has been used a little while, and the dies soon become loose and then tear and split the threads more or less.

Why does Mr. Lecount, in making his patent latho chucks, have 12 different-sized heads to the screws of 12 different-sized chucks? rendering it necessary to use a monkey-wrench (which can never be found around a lathe); or if a wrench is used with many holes, the piece to be turned has to

proper fluxes and melted with the usual precautions. The resulting hutton of lead is cupelled, correction made for silver in the litharge, and the weight of fine metal noted. The silver is then dissolved out with nitric acid and the gold weighed. Suppose the result to be as follows:

Weight of alloy of gold and silver.....	0.136
Weight of gold.....	0.026
Weight of silver.....	0.110

As each milligramme is equal to one ounce Troy per ton, the ore is found to contain per ton:

Gold..... 26 ounces  
Silver..... 110 ounces  
These results multiplied by the value of gold and silver give the value of the ore assayed.

The full unit is too much for the scorification assay. In this case it will be found convenient to employ  $\frac{1}{4}$  of the unit or 7.2915 grammes. A weight may be made equal to the above and kept in the balance case for use, by which the frequent handling of small weights will be avoided.

Two scorifiers are prepared with the above weight of ore in each. Test lead is added, and both are placed in the muffle together. When properly scorified, they are poured out, the slag detached in the usual manner, and the lead buttons cupelled. The resulting beads of fine metal are placed in separate pans of the balance. If no difference is found in the weights, both are placed in one pan, and their weight in milligrammes ascertained and noted. Should their weights not agree, a third scorification must be made, the result of which must be the same as one of the first. The corrected buttons are treated with nitric acid, pure silver being previously added, if necessary, and the weight of the gold noted as in the first example. As only one-half of the unit has been used, multiply all results by two before calculating value.

In computing the value of ores, I have found the following table to be a great convenience. Its use is simple; all multiplications are avoided. By its assistance the value of any number of ounces of gold or silver may readily be found.

In the examples given above, the table may be used as follows:

Twenty ounces of gold would be the same as two ounces with the decimal point moved one place to the right.

20 ounces gold.....	\$413.43.6
6 ounces gold.....	124.03.0
26 ounces gold.....	\$537.46.6

In the case of silver the result is obtained in the same manner from the silver column, thus

100 ozs. silver (decimal 2 places right).....	\$129.22.2
10 ozs. silver (decimal 1 place right).....	12.92.9
111 ozs. silver.....	\$142.22.1

The value of the ore is thus found to be per ton:

Gold 26 ozs. Troy.....	\$537.46
Silver 110 ozs. Troy.....	142.22
	\$679.68

The decimals of an ounce may be computed with equal facility. Let it be required to calculate the value of 22.321 ounces Troy of pure gold.

	GOLD.	SILVER.
20 ozs.....	\$413.43.6	
2 ozs.....	41.34.3	
0.3 ozs.....	6.20.1	
0.02 ozs.....	0.41.3	
0.001 ozs.....	0.02.0	
22.321.....	\$461.41.3	

Of course the silver column may be used in the same way.

The planting of rice in Louisiana has fallen off so that a crop of 80,000 barrels, or 16,000,000 pounds is considered an outside estimate.

Convenient Table for Gold and Silver Assays.

BY HENRY G. HANKS.

The number of Troy ounces in 2,000 pounds avoirdupois is 29,166. In the assay of gold and silver ores, the returns of which are always given in Troy ounces, I find it convenient to employ the unit of 29.164 grammes as the basis of all assays.

This method was first proposed, I believe, by Dr. Chandler, of New York, and is now generally adopted by American assayers.

When this unit is employed, it is evident that each milligramme of fine metal obtained is proportional to one Troy ounce in the ton of 2,000 pounds. The following example will make this perfectly clear.

Let 29.166 grammes of pulverized ore be placed in a crucible with litharge and the

## DOMESTIC ECONOMY.

### How to Use Your Currants.

"Daisy Eyebright," in the *Country Gentleman* gives the following directions for the various methods of utilizing this healthful and delicious berry. The suggestions are reliable and seasonable:

**CURRENT JELLY.**—Gather the currants when fully ripe; wash thoroughly clean from soil; squeeze the juice through a flannel bag, having first poured a teacupful of boiling water upon ten or twelve pounds of fruit. Measure the juice, and to every pint of it add one pound of the best lump sugar. Boil together twenty-five to thirty minutes, skimming off all the froth that rises; (this can go into the vinegar jug, that should sit behind the stove, ready to take in all such things.) When perfectly clear, strain through a jelly strainer or sieve, into cups or tumblers. When it is cold and solid, cut round pieces of white paper, dip them in alcohol and lay over the jelly; then paste stiff brown paper all over the tops of the dishes, and label them, with the date. There is no need of removing the stems for jelly, if the currants are well washed.

[Another correspondent of the same paper says: After washing, put them in the preserving kettle and cook until quite soft, then strain while hot. Measure your juice, and put it back on the fire and before adding the sugar allow it to boil ten minutes, and skim thoroughly.—ED. PRESS.]

**CURRENT WINE.**—Take fully ripe berries on the stems; put them on the fire, and let them become heated through; then press out the juice through a flannel bag. If a quantity of fruit is to be prepared, wash the clothes wringer thoroughly, and put the bag containing a portion of currants, through its rollers. To every gallon of juice add two quarts of hot water and four pounds of white sugar. Mix all together; put into a jug and tie millinet or lace over the mouth to keep out insects. Set in a warm place to ferment. In a month or six weeks the wine can be corked up. Let it remain in the jug, in the cellar, until April, then pour off the clear liquor, and bottle tightly.

**CURRENT VINEGAR.**—A good article of vinegar can be made from the mash that is left from jelly and wine. Pour boiling water over it but not too much, let it be quite colored with the juice; then to every gallon of it add one quart of molasses; set in the sun to ferment; and in three months, if not sooner, you will have a delicious vinegar.

**SPICED CURRANTS.**—These make a relishing accompaniment to roast meats, etc. Take the stems from five pounds of currants; add to them four pounds of brown sugar, three tablespoonfuls of ground cinnamon, two tablespoonfuls of ground cloves and a pinch of salt; and one pint of vinegar. Boil in a porcelain kettle for one hour; keep in jars, tightly covered.

**CURRENT PRESERVES OR JAM.**—Take the currants from the stems, and to every pound of them put three-quarters of a pound of white sugar; mash them up with a pestle, and boil for half an hour, skimming well. This is a good substitute for cranberry sauce with poultry.

**DRIED CURRANTS.**—Take seven pounds of currants, one pound of sugar, and cook till completely broken up; strain through a colander; boil the juice down to a thick syrup; add the currants that were left in the colander; cook as thick as possible without burning; spread on platters to dry in the hot sun, or an oven not too hot to dry slowly; one day is usually enough for one side; cut up in small squares; turn and dry on the other side. It is deliciously flavored and agreeable to the mouth of a fevered patient. Lay a small bit on the tongue and let it dissolve, or dissolve it in cold water for a refreshing drink.

**ICED CURRANTS.**—Select large, full bunches of currants; dip them in the white of an egg, and then roll in powdered sugar. A very handsome dish for dessert or supper.

**CURRENT ICE.**—Squeeze out two quarts of currant juice, add to it one pint of cold water and three pounds of white sugar. Put into the freezer and beat into it the whites of three eggs whipped to a stiff froth; freeze the mixture. This makes an elegant dish for dessert, as it freezes in a pink colored foam, which is very delicious.

**CURRENT SYRUP.**—Take three quarts of currant juice and three pounds of white

sugar; boil for twenty minutes, and bottle while hot, sealing the corks tightly with a wax made of rosin and tallow. This affords a pleasing beverage when mixed with ice water, and is valuable in the sick room.

**PRESERVING CURRANTS WHOLE.**—To preserve currants whole, wash them, then pick them carefully from the stems; add three-quarters of a pound of sugar to every pound of currants, and boil quarter of an hour; these must be put in air-tight jars, and they make a delightful acid preserve. For currant jam take a pound of sugar to a pound of currants, and boil half an hour.

### Keeping Oysters Fresh.

To keep oysters alive and fresh in their shells—Put them in a clean pan, cover them with pure water moderately salted, and changed every day. Keep them in a cool place.

We are in doubt as to its being necessary that an oyster should be constantly covered with water, to be kept alive and fresh. Some three years ago we spent a couple of weeks on the "South Shore" of Rhode Island, where, by the way, may be found—in limited quantity, however—some of the best oysters in the world. While there, and during the winter months, after the "oyster season" had long passed, we were invited to an oyster supper where the fresh bivalves were served up direct from their shells. Surprised at their delicious freshness, we enquired of our friend how he was able to keep them so fresh and sweet. He informed us that they were taken from the banks at the time of their best condition, and immediately "packed" in a cool, moist cellar, free from frost in winter. At intervals—we have forgotten how frequently—they were sprinkled with water in which Indian meal had been soaked, some of the meal still remaining in the water. A sufficient quantity of this solution was sprinkled over the pile, to allow of its reaching every individual. The bivalves would manifest their appreciation of this pluvial favor by instantly opening their shells, evidently to receive portions of the same within. This fact being made sufficiently evident by the crackling noise produced by the slight movement of the shells working and grating against each other. We were assured by our friend that he was enabled to keep oysters, in this manner, through the entire winter, with as little loss and trouble as so many potatoes.

### Useful Herbs.

There should be a good collection of useful herbs in every garden, or in some other place adjoining the homestead—such as are needed about the kitchen, in the nursery or in the sick room. A small bed of each kind will supply the requirements of a large family. The following are some of the most desirable:

**Balm**—a hardy perennial plant, the leaves of which have a lemon-like odor and an agreeable aromatic taste. They are used for flavoring dishes. A solution of them is beneficial in diseases of the lungs. **Basil**—the leaves when bruised have the odor and flavor of cloves, and are used for seasoning. **Caraway**—a hardy perennial plant, valuable for its seeds, which are used in confectionery and also in distillation. **Coriander**—a hardy annual cultivated for its seeds, which are used by confectioners, druggists and distillers. The young leaves are used in soups and salads. **Lavender**—a hardy, shrubby plant, of which there are several varieties. It is sometimes used for seasoning, but is more esteemed for making the distilled water which bears its name. **Common marjoram**—a shrubby perennial plant, which may be raised from seeds, but is generally propagated by dividing the roots either in the spring or autumn. The young shoots, cut at the time of flowering and dried in the shade, are used for seasoning. The plant is highly aromatic. **Sweet marjoram** is raised from seeds sown annually in the autumn. This plant is highly aromatic, and is much used both in the green and dry state for flavoring soups, etc. **Rosemary** is a half hardy, half shrubby plant, which requires a light, dry soil and sheltered situation. In addition to these we may enumerate sage, thyme, tansy, etc. One or more hop vines should also be found in every garden.

### Domestic Receipts.

**BROILED LOBSTER.**—After having boiled the lobster, split it from head to tail, lay it open; put pieces of butter over the meat; sprinkle it with pepper, and set the shells on a gridiron over the bright coals until nicely broiled through. Serve in the shells.

**TO ROAST A LOBSTER.**—Parboil a lobster; take it out of the water; rub it over with butter, and put it in a dish before the fire, baste it well with butter until it has a fine froth, and serve.

**LOBSTER PIE.**—Pick all of the meat out of the lobster, spawn and green; cut all up fine in a chopping tray, or beat it in a mortar; season it with pepper, salt, and vinegar; melt the butter; stir all together with a cupful of bread crumbs; put puff paste around the pie-plate; put in the meat; cover it over with paste; make a hole in the top; bake it in a slow oven.

**MINCED LOBSTER.**—Pick the meat from a fresh lobster; mince it very well; and put it into a stew-pan with a seasoning of pepper and salt, a little cayenne, a wine glass of white wine, and one of vinegar. Set it over a clear fire to stew for about ten minutes; melt two ounces of butter, with an anchovy, and the yolks of two well-beaten eggs; stir it into the lobster, and thicken the whole with bread crumbs; place it in a dish, and garnish with the claws and double parsley.

**LOBSTER SOUP.**—Pick the meat from a lobster already boiled, from the shell, and cut it into small pieces; roll the biscuits to a powder; put a quart of milk and a quart of water into a tea-kettle boiler, with a tablespoonful of salt and a teaspoonful of pepper. When the milk and water are boiling hot, add the lobster and pounded biscuit mixed to the soup with a quarter of a pound of fresh butter; let it boil closely covered for half an hour; pour it into a tureen, and serve.

**FAMILY PUDDING.**—One pound of flour, one pound of suet, chopped fine, three-quarters of a pound of sugar, one pound each of carrots and potatoes, well boiled and mashed together, half a pound of raisins, three-quarters of a pound of bread crumbs; spice, flavoring, and peel optional. Mix the whole together with a little water. It must not be too stiff, and certainly not too moist. Rub a basin well with drippings, and boil for three hours.

**TO BOIL HAM.**—The ham should be nicely washed in warm water and put into cold water. Allow a quarter of an hour to a pound of ham. When sufficiently boiled, remove it from the water, and place it in a baking-pan; remove the rind, and roast or bake one hour in a quick oven, dredging it frequently with a mixture of finely-powdered and sifted bread crumbs and flour, in the proportion of one part of flour to three of bread crumbs. If not scorched it will look finely upon the table. The flour prevents the crust or crumbs from scattering over the ham when cut.

### Mechanical Hints.

**COATING FOR BRICK AND OTHER OUTSIDE WALLS.**—The following coating for rough brick walls is used for painting lighthouses, and it effectually prevents moisture from striking through: Take of fresh Rosendale cement three parts, and of clean, fine sand one part; mix with fresh water thoroughly. This gives a gray or granite color, dark or light, according to the color of the cement.

If brick color is desired, add enough Venetian red to the mixture to produce the color. If a very light color is desired, lime may be used with the cement and sand. Care must be taken to have all the ingredients well mixed together.

In applying the wash the wall must be wet with clean fresh water; then follow immediately with the cement wash. This prevents the bricks from absorbing the water from the wash too rapidly, and gives time for the cement to set. The wash must be well stirred during the application. The mixture is to be made as thick as can be applied conveniently with a whitewash brush.

It is admirably suited for brickwork, fences, etc., but it cannot be used to advantage over paint or whitewash.

**PAINT FOR SHINGLES.**—Slake stone lime by putting it into a tub to keep in the steam. When slacked, pass through a fine sieve, and to each six quarts of it add one quart of rock salt and one gallon of water; boil and skim. To each five gallons of this add pulverized alum, one pound; copperas, one-half pound; potash, one-half pound; hard-wood ashes, sifted, four pounds. Apply with whitewash brush.

## LIFE THOUGHTS.

FEAR anticipates and magnifies future evils.

AMONG the hase, merit begets envy; among the noble, emulation.

POLITENESS is the just medium between ceremony and rudeness.

A MAN of sense may disdain an artifice as a rich man may wear a plain coat.

It too often happens that experience, like the stern light of a ship, illumines only the path we have traveled.

THERE is frozen music in many a heart that the beams of encouragement would melt into glorious song.

Few persons have sufficient wisdom to prefer censure, which is useful to them, to praise, which deceives them.

WE may not like all the company we meet with, but if we are brought in contact with it, we must make the best of it.

THE MANNERS which are neglected as small things are often those which decide men for or against us.

THE SCOTCH have a maxim to this effect: It is best to let a sleeping dog lie—especially if his fangs are sharp and he knows how to use them.

HE that will do no good offices after a disappointment must stand still and do just nothing at all. The plow goes on after a barren year; and while the ashes are yet warm, we raise a new house upon the ruins of a former.—*Seneca*.

IN vain do they talk of happiness who neve subdued an impulse in obedience to a principal. He who never sacrificed a present to a future good, or a personal to a general one, can speak of happiness only as the blind do of colors.

CO-OPERATION is the key to the wealth of the earth. Justly, wisely used, it will give to the laborer what should be his, the profits of his own earnings.

### Cast a Line for Yourself.

A young man, poor and dejected, stood watching some anglers on the banks of a stream. At length, approaching a basket well filled with fine fish, he sighed, and said:

"If I now had these I would be happy. I could sell them at a fair price, and buy me food and comfortable lodging."

"I will give you a good fish," said the owner, who chanced to overhear his words, "if you will do me a trifling favor."

"And what is that?" asked the other, eagerly.

"Only tend this line till I come back; I wish to go on a short errand."

The proposal was eagerly accepted. The old fisherman was gone so long that the young man began to be impatient. Meanwhile, however, the hungry fish snapped greedily at the baited hook, and the young man lost his depression in the excitement of pulling them in, and when the owner of the line returned he had caught a large number. Counting out from them as many as were in the basket and presenting them to the young man, the old fisherman said:

"I fulfill my promise for the fish you have caught to teach you that whenever you see others earning what you need, to waste no time in fruitless wishes, but to cast a line for yourself."

**SILENT INFLUENCE.**—If a sheet of paper on which a key has been laid he exposed for some minutes in the sunshine, and then instantaneously viewed in the dark, the key will be visible. Let this paper be laid aside for many months where nothing can disturb it, and then in darkness laid on a plate of hot metal, the spectre of the key will appear. This is equally true of our minds. Every man we meet, every book we read, every picture or landscape we see, every word or tone we hear, leaves its image on our brain. These, which under ordinary circumstances, are invisible, never fade, but in the intense light of cerebral excitement, start into sight on the application of heat. It is thus with all the influences to which we are subjected.

**FORTITUDE.**—In the lives of all of us there are hours of anxiety, disappointment, pain, and vexation, seasons of trial that are to be met only with stubborn patience. Greatness of soul is tested by the serenity with which these inevitable ills are born and finally overcome. The little mind will fret and chafe and fume over little things, even as the petty stream over its narrow, pebbly bed, while the deep, strong, mighty river moves swiftly and silently over the boulders that lie at its bottom.

PAIN KILLER  
PROP.  
PERRY, DAVIS & SON, PROVIDENCE, R.I.

1840 1870

CHOLERA.  
HOW TO CURE IT.

At the commencement of the Diarrhea, which always  
precedes an attack of the Cholera, take a teaspoonful of the  
Pain Killer in sugar and water (hot, if convenient), and  
then bathe freely the stomach and bowels with the Pain  
Killer clear. Should the diarrhea or cramps continue, re-  
peat the dose every ten or fifteen minutes until the patient  
is relieved. In extreme cases, two or more teaspoonfuls  
may be given at a dose.  
The Pain Killer, as an internal remedy, has no equal. In  
cases of Cholera, Summer Complaints, Dyspepsia, Dysin-  
tery, Asthma, it cures in one night, by taking it internally,  
and bathing with it freely. Its action is like magic, when  
externally applied to Old Sores, Burns, Scalds, and Sprains.  
For Stomachache and Toothache, don't fail to try it. In  
short, it is PAIN KILLER.  
Directions accompany each bottle.  
The Pain Killer is sold by all dealers in Medicines.  
Prices, 25 cents, 50 cents and \$1 per bottle.

## Editorial Notes Eastward.

Last No.

SAN FRANCISCO, June 21st.

My last notes, dated April 15th, mentioned resting a time in Omaha. I have since completed my journey, stopping briefly at Omaha, Chicago, Washington, Philadelphia, New York; visited my "old home" with joyous heart, and returned refreshed rather than fatigued.

On the Union Pacific R. R.

The trains are equipped with Miller's patent truss platforms and couplings, (recently illustrated in the PRESS), by means of which the principal danger of the cars, "telescoping into one another," in case of accident, is avoided. The coupling is self-acting, and the buffers so elastic that the cars are always started and stopped in a manner, agreeable to the necks of old R. R. passengers—with a degree of gentleness worthy of a vote of thanks to Gen. Miller for inventing the improvement and the managers of the U. P. for adopting it.

This R. R. Co. also use the Westinghouse atmospheric brake, operated instantly upon every car by the engineer. A cylinder about 10 inches diameter and 30 inches long underneath the center of each car, operates the brakes at each end by the force of compressed air conducted to it from the compressing pump or engine, operated by steam, on the side of the locomotive. Elastic hose with patent couplings conducts the air between the cars to stationary iron pipes connected with the cylinders under the cars.

We found the U. P. R. R. entirely in good running order. It is the longest road in the U. S. owned by one corporation, and its intelligent management seems to be a fortunate one for owners, passengers and the communities established and really accommodated along its route—without extravagance, without niggardness but with reason and fairness throughout.

The completion of the immense iron bridge over the Missouri river at Omaha, now building by the company at an immense outlay, will in future be looked upon as a fitting finishing stroke of one of the grandest of railroad enterprises during the 19th century. It will save much time and annoyance to through passengers, who must now be transported by ferry boat.

The Pacific Pullman Palace Car Co.

Run their superb sleeping coaches between Omaha and Ogden, and from Cheyenne over the Denver Pacific to Denver, Colorado, and from Denver over the Kansas Pacific to St. Louis, Mo. I was ticketed in the Palmyra, a "gentle sleeper" by night and superb saloon by day. We regard the "Pullman" decidedly the most superior cars running, and the best supplied and cared for by this company, under the superintendency of Mr. Bennett, of Omaha. Mr. B. is popularly known by many of our Californians for his special kindnesses to several excursion parties and general civility to Pacific coast passengers.

Chicago, Quincy and Burlington and Missouri River R. R.

On this line from Omaha to Chicago we were favored with one of the best accommodations yet provided for R. R. travelers, i. e., first-rate hotel dining cars—in which one may eat with the utmost leisure and satisfaction. At Burlington we had the pleasure of comfortably eating our dinner over the "Father of Waters" while viewing the city and overlooking the fine scenery along the river above and below.

On this route the road has lately been supplied with iron heavier than that of other roads. A double track spans a greater portion of the way. It is heavily ballasted and its trains run over a level line with great speed and safety. The rolling stock is excellent and provided with the latest improvements including the patent platform and atmospheric brake mentioned above. From my own experience and the testimony of others, I believe this the best of the four lines eastward from Omaha. Out of Chicago we took the

Fort Wayne and Pennsylvania Central R. R.

To Pittsburgh and Philadelphia, and the N. J. Central to N. Y. The scenery over the Alleghenies, especially in June, was beautiful, and the passage through satisfactory and commendable in the highest degree.

Having been longer in writing than in riding this trip, I will now "switch off" these "notes."

## Special to Inventors.

All inventors who secure valuable patents through the SCIENTIFIC PRESS PATENT AGENCY are specially favored with a liberal notice of the merits of their inventions in the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS—two first-class weeklies, the most widely circulated of any on this coast, reaching the very best classes for the benefit of our ingenious citizens. In many cases we know that such notices have been worth more to patentees than the whole cost of obtaining patents. While we give the most able and experienced counsel to inventors, our terms are more favorable to Pacific Coast inventors than those of any other Agency in the United States, besides the benefit derived from having their inventions set forth rightly in the start by gratuitous publication in more than one highly reputable journal.

## TRADE MARK PATENTS

—FOR—

Merchants and Manufacturers

Can now be secured to advantage under the NEW LAW

In the United States. Parties interested will be furnished with all information desired, and have their application intelligently prepared and promptly forwarded to the Patent Office, and their patents secured in good time, by DEWEY & CO., U. S. and Foreign Patent Agents, No. 414 Clay street, S. F.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Returning a newspaper or blank slip, WITHOUT the NAME and RESIDENCE of the subscriber is a thoughtless act, and useless both to subscriber and publisher.

WOODLAND, July 14, 1871.

DEWEY & Co.—Gents: I received the patent paper on my improved wagon all right, and I return thanks for the promptness with which you pushed it through.

Respectfully, C. ELLIOTT.

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new Strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 16 Dearborn street, Chicago, Ill. 23v1-12mbp

DAVID STODDART,

114 BEALE STREET, S. F.

OUR JOURNAL AND THE FAIR.—We shall not issue a daily edition of the PRESS in the Mechanics' Fair this year (as formerly), but shall devote a greater amount of labor upon our weekly issues, to render their columns more replete with interesting and reliable reports of the most worthy and important exhibits. Thus having more time to devote to our regular issues, we hope to present more valuable and readable reports than ever before. Exhibitors and others who have information of interest and importance to the public, are invited to furnish us with the facts as early as possible.

VISITORS AND EXHIBITORS at the Mechanics' Industrial and Horticultural Fair, in this city, are invited to call and subscribe for the PRESS. We shall give interesting and impartial reports, worth reading and preserving.

Complete Volumes of the Scientific Press from January, 1874, can be had at this office at \$3 per volume. Bound in cloth, \$5. A limited number only on hand.

FOR AN IRRITATED THROAT, COUGH OR COLD, "Brown's Bronchial Troches" are offered with the fullest confidence in their efficacy. They have been thoroughly tested, and maintain the good reputation they have justly acquired. As there are imitations, be sure to OBTAIN the genuine.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at John I. Tay's, Broadway, Oakland. apl-hp-tf

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave., New York Good work at high prices if desired. 21v1-12mbp

C. MULLER, No. 205 Montgomery street, has just received a splendid new assortment of eye glasses that he will sell at greatly reduced prices. Remember the place, 205 Montgomery street.

COPIES WANTED OF THE SCIENTIFIC PRESS OF JANUARY 7, 1871. We will pay 25 cents per copy, at this office, and also feel obliged to the sender.

CRAIG & BREVOORT'S  
Patent Condenser for Steam  
PUMPS, &c.

NO. 1.]

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as a guide to float F.

The valve, C, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.

NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere, when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. Address: H. L. BREVOORT, 6v23eowly 128 Broadway, New York City.

## PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON  
SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.  
The timber used is placed so directly in the line of strain, that less material is required to support the same load.  
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.  
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.  
Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.  
F. MALOON, Secretary. W. H. GORRILL, President.

## Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

### Eagle Quicksilver Mining Company—Location of mines, Eagle Mining District, Santa Barbara County, California.

Notice.—There are delinquent upon the shares of the following named persons, on account of assessment levied on the 14th day of June, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Benton, Dr H A.....	unissued	1	\$20 00
Bush, A T.....	unissued	1	20 00
Miller, John.....	unissued	1	20 00
Smith, Alfred.....	unissued	1	20 00
Townsend, J B.....	unissued	2	40 00

And in accordance with law, and the articles of agreement of said company, and an order of the Board of Trustees thereof, made on the 14th day of June, 1871, the whole or such undivided part of each delinquent share in said mines as may be necessary to pay said assessment upon each, will be sold to the highest bidder at public auction, for cash, in United States gold coin, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, California, on Monday, the 14th day of August, 1871, at the hour of 2 o'clock P. M. of said day, to pay the said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal. au12-1w

### Highland Silver Mining Company—Location of works, Railroad District, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 13th day of July, 1871, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, California, on Monday, the 14th day of August, 1871, at the hour of 2 o'clock P. M. of said day, to pay the said delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.  
Office, No. 28 Merchants' Exchange, California street, San Francisco, Cal. July15-1d

### Kincaid Flat Mining Company—Location of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 14th day of August, 1871, an assessment of twenty (20) cents per share was levied upon the capital stock of said company, payable immediately, in U. S. gold and silver coin, to the Secretary, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, California, on Monday, the 14th day of September, 1871, at the hour of 2 o'clock P. M. of said day, to pay the said delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

K. H. COLEMAN, Secretary.  
Office, 220 Clay street, San Francisco. au12-1w

### Mina Rica Mining Company—Location of works, Auburn District, Placer County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 8th day of August, 1871, an assessment of twenty (20) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, California, on Monday, the 14th day of September, 1871, at the hour of 2 o'clock P. M. of said day, to pay the said delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. R. SPINNEY, Secretary.  
Office, Room No. 2, third floor, No. 418 California street, San Francisco, California. au12-2w

### Nevada Land and Mining Company—Location of works, Steptoe, Johnson and Latham, Antelope and Clifton Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 25th day of July, 1871, an assessment of four (4) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, California, on Monday, the 14th day of September, 1871, at the hour of 2 o'clock P. M. of said day, to pay the said delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, California. July12-5w

### North America Consolidated Mining Company—Location of works, White Pine Mining District, County of White Pine, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 31st day of July, 1871, an assessment of twenty (20) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, California, on Monday, the 14th day of September, 1871, at the hour of 2 o'clock P. M. of said day, to pay the said delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal. au12-5d

### Ophir Copper, Silver and Gold Mining Company—Location of works, Ophir, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 24th day of August, 1871, an assessment of seventy-five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, California, on Monday, the 14th day of September, 1871, at the hour of 2 o'clock P. M. of said day, to pay the said delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. G. BRUSH, Secretary.  
Office, 314 California street, San Francisco. au12-4w

### Taylor Mill and Mining Company—Location of works, Georgetown District, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 11th day of July, 1871, an assessment of ten (10) cents per share was levied upon each and every share of the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, California, on Monday, the 14th day of September, 1871, at the hour of 2 o'clock P. M. of said day, to pay the said delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

SAM'L S. MURPHY, Secretary.  
Office, 529 Montgomery street, over Sather & Co's Bank, San Francisco, Cal. July15-1d

## KNOWLES' PATENT STEAM PUMP.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.

The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.

The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, CAL., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.

Yours truly, A. J. STEVENS, General Master Mechanic.

OFFICE OF PEOPLE'S TRANSPORTATION CO., PORTLAND, OREGON, April 22, 1871.

Mrs. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.

Yours respectfully, G. MARSHALL, Chief Engineer.

OFFICE OF N. Y. CENTRAL R. R., ALBANY, June 3, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.

Yours very truly, C. P. HARM.

OFFICE OF DELAMATER IRON WORKS, NEW YORK, May 26, 1871.

Messrs. KNOWLES & SIBLEY, 92 Liberty street—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.

Yours very truly, GEORGE M. REYNOLDS, Supt. Engineer.

U. S. NAVY YARD, NEW YORK, June 3, 1871.

Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully, WM. W. W. WOOD.

OFFICE OF THOMAS IRON WORKS, HOKENDAUQA, Pa., June 1, 1871.

Messrs. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which to say the least are equal to the best we have tried. I cheerfully recommend "The Knowles Pump" to any who may have use for a first-rate Steam Pump.

Respectfully yours, etc., EDWIN MICKLEY, Supt. of Mines.

OFFICE OF THE SAUCON IRON CO., HELLERSTOWN, Northampton County, Pa., May 26, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: We can most cheerfully respond to your inquiry as to the quality of the Knowles Patent Steam Pumps we have in use. We bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given VERY GREAT satisfaction, and that we like them better than any we have ever used.

Yours very respectfully, G. W. WHITAKER, President and Superintendent.

OFFICE OF NEW HAVEN WATER CO., Dec. 18, 1869.

Messrs. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyls., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.

Yours very truly, P. SAULT, Superintendent.

CENTRAL AND WESTERN PACIFIC AND CAL. AND OREGON RAILROADS, OFFICE Supt. W. M. P. & M., SACRAMENTO, CAL., July 8, 1870.

A. L. FISH, Esq., San Francisco—Dear Sir: Your favor of the 2d inst. is received, asking my opinion in regard to the Knowles Steam Pump, and would say I have used the Knowles Steam Pump for several years, and consider them for all purposes the best steam pump in use. Yours truly, E. F. PERKINS, Supt. M. P. & M.

OFFICE OF RED BLUFF WATER WORKS, Red Bluff, June 11, 1871.

A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction; and I take great pleasure in recommending them to all you have claimed for them, and I will add that I think they have no equal. Yours, etc., JOHN CLEMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 24x22-eow

## Jeinsen Lubricator Company—Notice is

hereby given, that at a meeting of the Board of Trustees of said Company, held on the 1st day of August, 1871, an assessment of Fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 128 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 7th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 28th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees. CALEB T. FAY, Secretary.  
Office, Room No. 7, No. 428 California street. au12d

## Pinto Mining Company, Location of Works, Silverado, Pinto Mining District, White Pine County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied May 24th, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
Leopold Jacobl.....	1	60	\$ 7 50
Leopold Jacobl.....	from 2 to 32	50	193 75
A H Ward, Jr.....	111	805	100 62
Henry G Langley.....	171	1 610	201 25
Robert E Johnson.....	213	321 3/4	40 21
Erasmus Olsen.....	212	10,000	1,250 00
D B Arrowsmith.....	not issued	1,610	201 25

And in accordance with law, and an order of the Board of Trustees, made on the 24th day of May, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the 17th day of July, 1871, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

D. B. ARROWSMITH, Secretary.  
Office, 426 Montgomery street, San Francisco. 26x22-3t

## PINTO MINING COMPANY.—The above sale is postponed until Wednesday, the 16th day of August, 1871, at the same time and place. By order of the Board of Trustees.

D. B. ARROWSMITH, Secretary.

## Tecumseh Gold, Silver and Copper Mining Company—Location of Works, Gopher District, Calaveras county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 28th day of July, 1871, an assessment of five dollars (\$5) per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, S. J. Hermann, at the office of the company, 516 Kearny street. Any stock upon which said assessment shall remain unpaid on the 4th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 28th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. J. HERMANN, Secretary.  
Office, 516 Kearny street, San Francisco. au12d

## The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,  
MINING,  
And BLASTING  
POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported d into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST ELASTINE POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office. 16x20-3m JOHN F. LOHSE, Secretary.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION:—D is a glass chamber which contains the lubricant. C is a valve connecting with cup which introduces the lubricant into chamber D. F is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe (therefrom). A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the ejection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. 1e18-1f

## CALIFORNIA BRASS FOUNDRY,

No. 125 First street, opposite Minno,  
SAN FRANCISCO.

ALL KINDS OF Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE. J. H. WEED V. KINGWELL.

## WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company gives a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it,

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works. Ten of these Mills are now in operation. For further particulars address

FURMAN R. WILSON,

San Francisco.

## STEAM JET PUMP.

Blackslee &amp; Williams' Patent—For Water, Oils, Acids, Etc.

The best COLD WATER PUMP for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit:—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

Send for Circular. PARKER &amp; HUNT, Southeast cor. Tenth &amp; K Streets, Sacramento City Cal. AGENTS—CHAS. F. BROCK, 117 California st., San Francisco; KEEP &amp; BARGION, Stockton. Can be seen at McAFEE, SPIERS &amp; Co's. Boiler Works, S. F. 21v21-1f

## THE PATENT

## Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to R. STONE, 25v22-3m 422 Battery street, San Francisco.

McAFEE, SPIERS &amp; CO.,

Platinum Scrap and Ore purchased. 22v18t

**Varney's Patent Amalgamator.**  
These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

**This Amalgamator Operates as Follows:**  
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.  
Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

**WHELPLEY & STORER, FURNACES,**  
MACHINES AND PROCESSES.

WHELPLEY & STORER offer for sale their Pulverizers, Processes, and Water Furnaces for Gold and Silver Ores, in any part of the United States, and the Stetefeldt Furnace in Mono and Alpine Counties, Cal. They have no agents in California, Nevada or elsewhere.  
Address **JACOB J. STORER,**  
24v22-3m Boston, Mass.

**STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.**

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.  
Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pan has long been in constant operation. 15v20-1mr, 1amtf

**BLAKE'S PATENT STEAM PUMP.**

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast, as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility having no cams, nor complex rotary arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no dead points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any band work whatever. The Blake Pump is extensively used on Railroads and Steamboats; in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Pump on Exhibition. The agents have recently imported several of the largest sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them; we claim for it that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by BERRY & PLACE, Machinery Depot, 112 and 114 California st., San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

BANDMANN, NEILSEN & CO.,  
General Agents, No. 210 Front Street.

The Largest and Best in America.

### The Scientific Press,

Established in 1860, is now the Largest, Most  
Original, Best Illustrated and most Ably and  
Carefully Edited Practical Mining Journal on  
the Western Continent. Its contents are made  
up of fresh intelligence in a condensed and inter-  
esting style, easily appropriated by the reader,  
who finds its columns replete with new facts  
and ideas not obtainable in the books of the  
past or in any one other of the journals of the  
day.

Varied in its carefully compiled and con-  
veniently arranged departments, representing  
the special and leading industries of the Pacific  
States—Mining, Mechanism, Manufacturing,  
Building, Improvements and Inventions—it  
becomes a weekly informant to all Scientific,  
Mechanical, Manufacturing and Industrial  
Progressionists on the coast, an immense list  
of whom testify to its pleasant, profitable and  
elevating influence.

The progress of our journal has been steady  
and unvarying. Encouraged by a liberal  
class of readers who exhibit their appreciation  
in a substantial way, we shall, with our in-  
creasing facilities, experience and information,  
make each coming issue superior to its prede-  
cessor.

Let every friend of Science and Industry on  
this side of the continent take pride, not only  
in sustaining, but accelerating the advancement  
of a faithful representative of its highest inter-  
ests by subscribing for it and urging its patron-  
age by others—now, without delay.

Subscription \$4 per annum, in advance.

Address

DEWEY & CO.,

Publishers and Patent Agents, 414 Clay St., S. F.

### GOOD HINTS ABOUT ADVERTISING!

Be Careful of your Seed! Sow it in Good Ground!

If you have goods to sell to farmers, it will pay you  
better to advertise in a farming paper, read and pre-  
served by 10,000 intelligent farmers, than in misce-  
laneous daily or weekly journals with 20,000 readers,  
comprising only 1,000 farmers. A mining journal in  
California with 10,000 readers reaches more miners than  
any other ten papers in the Union.

Purchasers are more likely to look for information in  
the advertising columns of a paper devoted to their  
special interests, than elsewhere, when ready to buy.  
Some will not read advertisements upon any other oc-  
casion.

Weekly journals are read most leisurely and carefully,  
and at a time when the subscriber is most favorably in-  
clined to examine advertisements. The newspaper  
most specially representing your particular branch of  
industry is usually best entitled to your patronage, and  
the most profitable medium you can employ.

Advertisements appearing in a handsomely printed  
journal of established good character are more effective  
and beneficial to permanent dealers than when inserted  
in a shabby sheet of indifferent reputation.

Advertising in cheap priced mediums (of limited  
circulation) is like buying goods at retail when you  
could as well take them at wholesale.

Information imparted to a list of superior and intelli-  
gent and active and industrious readers (naturally  
looked up to by others for information), is seed sown in  
good soil for the advertiser.

Fame and fortune are gained, nine times in ten, by  
liberal and judicious advertising.

### ARTIFICIAL LIMBS.

A. A. MARKS, No. 575 Broadway, N. Y. City,

the inventor and author-  
ized United States Govern-  
ment manufacturer of the  
celebrated First Premium  
Artificial Limbs with Rub-  
ber Hands and Feet, has  
published a new and enlarged edition of his Illustrated  
Pamphlet, of importance to all who have suffered am-  
putations, especially to officers and soldiers who lost  
their limbs in service. Copies sent free to applicants  
21v1-13t-12r

### ACTIVE MEN!

With Experience in Canvass-  
ing business, can now obtain lucrative and permanent  
employment by DEWEY & CO., Patent Agents and Pub-  
lishers of the SCIENTIFIC PRESS and the PACIFIC  
RURAL PRESS, No. 414 Clay street, S. F.

# SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,  
**Mining, Mechanic Arts and Inventions.**

BY DEWEY & CO.,  
Patent Solicitors.

SAN FRANCISCO, SATURDAY, AUGUST 19, 1871.

VOLUME XXIII.  
Number 7.

## Our First Narrow-Gauge Passenger Locomotive.

This locomotive—with two others for freight service—has just been completed for the Denver & Rio Grande Railway at

two-thirds that of the front-wheeled cars designed and built for the same road.

As much interest attaches to the subject of the speed practicable on narrow-gauge roads, we may remark that the proportions of this machine are such that it develops

of the resistance of curves, is as follows:

On a level.....612 gross tons.  
On a grade of 40 feet to the mile.....164 gross tons.  
On a grade of 80 feet to the mile.....98 gross tons.

From these figures should be deducted 17 gross tons, the weight of the engine and tender in working order, to get the total

## Trials of Road Steamers.

We would call the special attention of our readers to the extraordinary performances of the Hyde Road or Overland Steamer, as detailed on another page of

NARROW-GAUGE PASSENGER LOCOMOTIVE FOR THE DENVER & RIO GRANDE R. R.—SIDE VIEW.

the Baldwin Locomotive Works, Philadelphia, and by the time this meets the public eye will undoubtedly be at work on the pioneer, narrow-gauge line in the United States. As this machine is entitled to the designation of the first narrow-gauge passenger locomotive built or operated in this country, a brief description of it will be of interest both to the railroad and the general public. Its dimensions are as follows:

Cylinders, 9 inches diam. Stroke of piston, 16 inches.  
Diameter of driving wheels.....40 inches.  
Diameter of pony wheels.....24 inches.  
Distance between center of pony wheels and center of front drivers.....5 ft. 8½ in.  
Distance between driving wheel centers.....6 ft. 3 in.  
Total wheel-base of engine.....11 ft. 11½ in.  
Rigid wheel-base (distance between driving-wheel centers).....6 ft. 3 in.  
Capacity of tender.....500 gallons.  
Diameter of tender-wheels.....24 inches.  
Distance between centers of tender-wheels.....6 feet.  
Total wheel-base of engine and tender.....26 ft. 5½ in.  
Length of engine and tender over all.....35 ft. 4 in.  
Weight of tender empty.....5,500 lbs.  
Weight of engine in working order.....25,300 lbs.  
Weight of engine on drivers.....20,500 lbs.  
Weight of engine on each pair of drivers.....10,250 lbs.  
Weight of engine on pony wheels.....4,800 lbs.  
Height of smoke stack above rail.....9 feet 9 in.  
Height of cab from foot-board to center of ceiling.....6 feet 3 in.

It will be seen that the rigid wheel base is given as 6 feet 3 inches, the distance between center of driving wheels. This is due to the fact that the leading or front wheels are fitted with a swing bolster and radius bar allowing them to move laterally under the engine in passing curves. These wheels are also equalized with the front pair of drivers. By this arrangement, while the front truck assists in guiding the engine on a curve and so relieves the front pair of drivers from the excessive wear of tires which would otherwise result, the rigid wheel base is reduced so that the engine will pass curves of very short radii without difficulty. It is in fact only about

the same total travel of piston in going one mile as does a locomotive having 24 inches stroke of piston and driving wheels 5 feet in diameter. It is therefore appa-

FRONT VIEW.

rent that equal or nearly equal speeds are possible with this engine as with the engine of the usual pattern on the full gauge, i. e. 24 inches stroke and 5-foot drivers.

The plan of this engine gives somewhat more than four-fifths of the whole weight on the drivers, so utilizing it for adhesion. Its tractive power on a good rail exclusive

weight of cars and lading which can be drawn on a level or on the grades named.

The freight locomotives built for the same road have three pairs of drivers and a swing bolster pony truck. Their cylinders are 11 inches diameter and 16 inches stroke; drivers 36 inches. The total weight

REAR VIEW.

of engine in working order is 33,500 lbs., of which about 29,000 lbs. are on the drivers. Being distributed to three pairs of wheels, the weight on each pair of drivers is a little less than 10,000 lbs., nearly the same result as with the passenger engine. The large amount of attention now being given to narrow-gauge railroads in this State will lend additional interest to the above.

the present issue. When we take into consideration the wild, rugged nature of the country, the primitive condition of the roads and the unsuitable water and difficulty of obtaining the same, without previous preparation, the accomplishment of this engine is unequalled by anything of the kind on record. The trip was certainly a most extraordinary one, and will be read with much interest by engineers everywhere. In order to give the details as full and perfect as possible, we have given the engineer's "notes" just as they were penned from day to day—a record which will be fully appreciated and understood by practical engineers. To the end that a fair comparison may be made between the performances of this engine and the various engines which have been brought out in other localities, we shall next week give the details of a trial of several road steamers which was made a week or two since at the Fair Grounds, in Waverly, New Jersey, the particulars of which have been opportunely furnished us by our New York correspondent; also another trial of a similar character which took place at the July meeting of the Royal Agricultural Society of England, at their Fair Grounds in Wolverhampton, the particulars of which are now before us in the Birmingham News of July 4, 1871. These reports, which are too lengthy for insertion to-day, will show a most favorable contrast in behalf of our California machine over any other which has yet been put to a public trial. Letters patent for the United States have already been secured through the agency connected with this office, and steps taken to secure foreign patents.

## MECHANICAL PROGRESS.

## Petroleum for Fuel.—Another Difficulty Overcome.

Our readers have been informed from time to time, of the progress which has been made in efforts to introduce petroleum as fuel for making steam and for other important purposes. After the experiments reported some three years since in this city, in New York and Boston, there appears to have been a cessation of public experiments at least; but it appears that inventors in the mean time have not been altogether idle in this important line of progress; for we are now informed through the *Missouri Republican*, that another series of experiments were commenced in May last, at the Laclede Rolling Mills, for testing the value of petroleum as a fuel for heating iron furnaces.

The petroleum, in this instance, as in all others, which have been tried with any remarkable degree of success, is converted into a gas, in a retort, before being burned; but the improvement here consists in admitting small jets of superheated steam into the bottom of the retort, whereby a constant agitation is kept up and a larger amount of carbon is converted into gas than in the retorts heretofore constructed; or it is carried off mechanically by the force of the steam, and burned in the gas flames, as finely divided, free carbon. At all events, the account before us asserts that no free carbon collects in the retorts, a circumstance which has heretofore constituted the fatal hindrance to all attempts to burn petroleum, on a large scale, for making steam.

At the Laclede mills, the iron is brought to a white heat by petroleum, in one-fifth the time required by the use of coal. The saving in fact is claimed to be from 30 to 50 per cent.; and so successful have been the experiments there that they are already being repeated in other localities and for other purposes. Ever since the first attempts to use petroleum for steam fuel in this city, we have expressed our confident belief in its eventual success, and it is with pleasure that we record this new evidence of progress in this important matter. We shall look with much interest for further developments which will be reported as soon as received.

## Use of Oxygen for Clearing Oil Wells.

One of the chief causes for the cessation in the flow of oil wells is the accumulation of paraffine, which adheres to the walls of the well itself or to those of the crevices in the rocks through which the wells are fed. Torpedoes, charged with dynamite or other explosive compounds, have been used for several years as a means for removing this paraffine. This device, however, has often been found not only to fail in the removal of the obstruction, but also sometimes to materially injure the wells themselves, or to wholly close them up instead of clearing them out. In view of these failures a new plan has been adopted, which consists simply in burning out the paraffine, by the introduction into the well, of oxygen to sustain the process of combustion. The oxygen is brought in contact with the obstructing paraffine by means of pumps and pipes, and there ignited. The fire is commenced at the point of obstruction nearest the surface, and is continued downward and out into the lateral crevices, wherever the paraffine is collected, and continues to burn so long as oxygen is supplied to keep it up. This method is found cheaper and much more effective than the use of torpedoes, and no danger is incurred of injuring either the well or tubing.

**COAL SUPPLY OF ENGLAND.**—The Impression has become very general that the coal supply of England is being rapidly exhausted. The short period of 100 years even has been fixed upon by some as the time when an end would be put to anything like the present supply. Such reports were even beginning to affect the movements of capital; and so much alarm was manifested that a Royal Commission was appointed,

two or three years since, to examine into the present condition and future prospect of the supply. This commission has nearly completed its labors, and, according to the *London Times*, the report will contain a demonstration, that, even after making all reasonable allowances for the annual increase in the demand, there is now remaining in the mines, in a position of economical availability, coal enough to meet the wants of the British Isles for from 800 to 1,000 years to come. The appearance of this report is looked for with much interest.

**A NEW MECHANICAL MOVEMENT.**—The accompanying engraving illustrates a new mechanical movement, recently invented and patented by E. G. Russell, of Ravenna, Ohio. We show the movement attached to a pump; but the principle is one capable of wide application. By it a circular motion is converted into a rectilinear one, within a very limited arc or

space. Referring to the engraving it will be seen that this is accomplished by means of crossed links, which, in the illustration, are pivoted to the arms of the pump handle, and by other pivots connected with the pump rod. Many instances will occur to the mechanical reader where such a movement may be advantageously applied.

## Hoop Iron Chains.

A chain of the most remarkable texture and workmanship has recently been described in the English journals. The links of this chain, oval in shape, are made from ordinary hoop iron, galvanized and brazed. According to the accounts we have seen of this curious piece of work, the hoop iron is first wound on a reel by a machine suitable for the purpose until the requisite thickness is secured, after which it is passed through a furnace of molten metal. It is then rounded off and finished ready for the brazing, which completes the process. The links are then joined, and between each link is a stay, as in ordinary chains. The strength of a chain thus made is said to be something enormous. In some experimental tests lately made, a 2-inch chain of this pattern was attached to a wrought-iron testing chain of 2½ in. diameter, and on the application of hydraulic power the links of the hoop iron chain were elongated ¼ in., and those of the wrought-iron chain ⅜ in.—the strain being equal to a suspended weight of 110 tons. When the strain had reached 114 tons the testing chain broke, and a careful examination of the hoop iron chain showed that, with the exception of some unimportant openings in the links, which did not seem to have been properly brazed, it did not show any evidence of the extraordinary strain to which it had been subjected. If the results thus described were actually reached, the invention may prove of the greatest practical importance as applicable to the manufacture of chains of unusual strength and small size. We have no information as to whether the process of manufacture is more expensive than that now employed, or whether it is less so—but if the information we have received respecting the strength of these chains be correct, we should say that any increase in cost would be more than compensated by the superior advantages of hoop iron chains for heavy work.—*Iron Age*.

## SCIENTIFIC PROGRESS.

## The Heavens From a Southern Point of View.

Dr. B. A. Gould, it will be remembered by many of the readers of the *PRESS*, has recently been appointed director of the observatory at Cordoba, a city of the Argentine Republic, located on the eastern slope of the Andes and near the center of the South American continent. This distinguished astronomer has already arrived at his post, and entered upon his specific labor of mapping the stars of the southern hemisphere. In a letter to the *American Journal of Science* for August, he speaks very enthusiastically of his work. He says the transparency of the atmosphere at Cordoba greatly facilitates astronomical observations, and exhibits to the trained eye an almost incredible number of stars, nearly twice the number that can be seen in the same constellations from the observatories in the northern hemisphere. In the *Canis Major*—an extreme instance—200 stars are defined, while Argelander saw but 39. The magnificence of the Milky Way, as seen from the vicinity of Cordoba is spoken of as perfectly indescribable. When seen through the telescope, even by those not unused to such observations in other climates, exclamations of astonishment and delight are universally evoked.

The knowledge of the southern constellations is as yet very limited, and much of the extreme southern sky is utterly unknown. Much is expected from the researches of Dr. Gould and his associate in this interesting field of research.

The Doctor is especially anxious to be furnished with a photographic equipment, and a trained photographer. It is but reasonable to suppose that even the magnificent photographs of the moon taken by Mr. Rutherford, might be greatly excelled, when taken with equal care and skill through the pure and transparent atmosphere of that locality.

**SACCHARATE OF MERCURY.**—The theory of saccharate of mercury, as applied to the saving of the precious metals is stated, by the inventor, in the *Scientific American*, as follows:—"The difficulty in getting mercury thoroughly incorporated with clay ore, or washings from crushing machines, renders it advisable, if possible, to combine the mercury with some substance soluble in water. If this can be effected, a very small quantity of mercury will do for the purpose, as it will be brought into contact with every particle of gold in the mass. I have rubbed mercury and sugar together in a mortar, and find that the sugar immediately acquires a pale gray color, the granules being coated with the mercury in the finest possible degree of comminution. If this powder be thoroughly mixed with pulverized ore, and the whole then washed with water, there will be no grain of earth, and consequently of gold, that is in contact with metallic mercury. This is the theory, and it seems eminently practical. 'Chalk, molasses, and many other substances' have no kind of fitness for the purpose."

Perhaps some of our California millmen may be disposed to give the preparation a practical solution. If any one should do so, we should be pleased to give the result, through the columns of the *PRESS*.

**COLD GALVANIZATION OF IRON.**—The metal is cleaned by being placed in a bath, made up of water 1,000 litres, hydrochloric acid 550 litres, sulphuric acid 50 litres, glycerine 20 litres. It is then placed in a bath containing 20 per cent. of carbonate potassa, and next transferred to a metalizing bath consisting of water, 1,000 litres, chloride of tin 5 kilogr., acid sulphate of alumina 4 kilogr., chloride of aluminum, 10 kilogr. The metal is left in this mixture for from 3 to 12 hours, according to the desired thickness of the coating.—*Ex.*

**BOILERS AT HIGH LEVELS.**—The facts concerning the working of boilers at high levels is given by a correspondent of the *Scientific American* as follows:—"If a boiler, whose safety valve is arranged to work at 50 pounds under an atmospheric pressure of 15, be carried to an elevation where the atmospheric pressure is only 9 pounds, it will do the same service, when the safety valve lever or balance indicates an internal pressure of 50 pounds; because, although the actual internal pressure is only 44, the

back pressure of the engine is reduced 6 pounds per inch.

Pressure gauges are made to indicate an excess of internal pressure over the atmospheric pressure of 15 lbs. per inch, so that if an ordinary pressure gauge indicates an internal pressure of 50 pounds under an atmospheric pressure of 9 pounds, the actual internal strain on the boiler is 56 pounds per inch, which shows an increased strain of 6 pounds per square inch, when working according to the ordinary pressure gauge.

## Astronomical Observations.

The statistics of modern astronomical observation, (we condense from *Nature*) would be very curious, if it were possible to get at them. A report showing the gradual increase in the number of telescopes manufactured during the last 50 years would be very interesting; and so would a table comprising at once the advance in their dimensions and the diminution in their cost. The result would at first sight cause great surprise among those unacquainted with the subject, or those whose recollection does not go back to days when 5 inches was as extraordinary an aperture as double that size now. But the number of competent observers has not increased proportionately. For this there are several obvious reasons. One is that the process of discovery is not, generally speaking, renewable. What has been once detected is usually placed on record in har of all future claims. Again, looking upon the observer and his instrument as a complex apparatus, the improvement of the intelligent has not kept pace with that of the material part. The unimprovable constitution of our own atmosphere is a physical obstacle which must not be forgotten. The only way to obviate this grievous hindrance is to get above it; but however advantageous this may be, it must ever be confined to a favored few. If, however, we have asserted that observers have not multiplied in proportion to the means of observation, this is but a relative statement; the absolute fact is that at no former time has there been so numerous, or so zealous, or on the whole so competent a band of astronomical students.

**MINERAL WEALTH LOST TO FRANCE.**—According to the *London Mining Journal*, the cession of Alsace and Lorraine gives Germany 25 iron furnaces with a production of 204,579 tons, leaving in France only 12 furnaces with a production of 76,466 tons. It would appear that the Prussian plenipotentiaries have traced out the new frontier, not on any topographical plan, but very probably on a geological map prepared at Berlin. It is noticeable, for instance, that the new limits between France absorb, to the profit of the Germanic Confederation, all the rich bearings of the oolitic ironstone in the Moselle and the Meurthe, the Longwy group excepted. Thus the concessions remaining in France comprise an area of 5,333 acres, producing, according to the last available returns, 140,281 tons per annum, while the concessions in Alsace and Lorraine transferred to Germany comprise an area of 18,062 acres, with a production of 500,660 tons per annum.

**THE SHERMAN PROCESS**, of which so much has been said and written in England during the past few months, appears to be losing favor. At the last meeting of the Iron and Steel Institute in London, such prominent iron masters as Messrs. Menclaus, of Dowlais, Hopkins, of Cleveland, and Mr. I. L. Bell, stated that the results following his process were quite inapplicable. Mr. Seimens said that when he first heard of the process which claimed to drive out all the sulphur and phosphorus in a ton of iron with an ounce of "physic," he knew such a result was impossible, and the experiments which had been made proved the correctness of his opinion.—*Van Nostrand*.

**FOSSILIFEROUS GRANITE.**—M. Reinsch, inspector of Mines at Gotha, states that he has recognized microscopic organic remains, both animal and vegetable, in certain granite rocks which have heretofore been reputed to be of igneous or eruptive nature; and Dr. Müller mentions a phenomenon which has some analogy with the preceding, viz.: The existence of living creatures in the waters of the Geysers of California, at a temperature of 202° F.

# CORRESPONDENCE.

## A Trip to Colorado.—No. 6.

BY OUR OWN TRAVELER.

Georgetown.

This is the county seat of Clear Creek Co., situated on south Clear creek, affording the best water-power in Colorado. It is the center of the richest silver region in the Territory. Mining in the vicinity this year is giving better returns than ever before.

One of the essentials for the rapid advancement of this city is "the coming railroad," making direct rail communication from abroad and enabling the transportation of base ores to the valley in proximity to the coal beds, cheapening the cost of reduction and increasing the products immensely. The proposed route is from Denver to Golden, thence to Central City, via Gilpin and Clear Creek counties, and thence to Georgetown.

Here silver and lead are the predominant metals, while at Empire, only a few miles distant, gold is the principal metal.

The McCoy and the Leggett hotels offer the greatest accommodation to the traveling public, affording a cordial welcome to the stranger. Twelve miles distant from this city is the well-known Gray's Peak, 14,245 feet high. Many Eastern tourists are now visiting it. On horseback parties can go up and down on the same day, and view the numerous small ranges, spurs and peaks. Visitors say it affords a grand

has been taken out. They pay the miners by contract, \$20 per foot, and in some few places pay only \$16. They pay \$35 to \$40 per fathom for stoping on the lode. The ore is sorted at the mine and the first-class is taken to Swansea. The Philadelphia Co. own 500 feet and the British Co. 1,100 feet. The two companies own a small Burleigh drill and will have it going shortly. The character of the ore is galena, zinc blende, iron pyrites, silver, etc. The formation is "peach granite," a term used by miners.

The CHASHER SILVER MINE is about half a mile from the Terrible, on Sherman Mountain, Griffith district. C. A. Hoyt is agent and superintendent. The main shaft is 140 feet deep with drifts 60 feet deep on each side. The main shaft is filled with water up to the drift running west, but a small pump keeps the drift dry. Twelve men are employed. Considerable stoping has been done. The lode is small, about four to six inches in granite. The ore is argentiferous galena, pyrites, gray copper, and specimens of native silver, which assays \$50 and upwards. A new engine for hoisting and driving a fan has been put up.

The BURLEIGH TUNNEL AND MINING CO. While passing up the middle branch of Clear Creek I visited this well-known tunnel, with Mr. C. Burleigh, one of the owners and the inventor of the famous Burleigh drill. In company with him I was shown through the mine. The main tunnel is in 1,075 feet. They have one of the tunneling machines (formerly illustrated in the Press), at work, doing very well indeed. It costs the company from \$32 to \$33 per foot to run the tunnel, 9x9. The expenses before have been as high as \$60. For many years efforts have been made to bring out a drill for working tunnels, and now this seems to be a success. This company have eight drills, and employ two rock men, two blacksmiths, and two engineers, working day and night. They have struck some very fine smelting ore that will yield 55 per cent. of lead and 30 ozs. of silver. This was the return from a sample lot worked.

Idaho Springs.

About six miles from Central City and 35 miles from Denver, on South Clear Creek, are situated these noted hot springs, amidst grand mountains and beautiful scenery. Eastern tourists are visiting them numerous and enjoying the accommodations of the Beebe and Springs hotels.

W. H. M.

## Great Waste of Precious Metals.

EDS PRESS:—I observe in your issue of Aug. 5th, that the ore of the "California" mine, in Julian District, San Diego county, has yielded \$1 per pound in a hand mortar, and \$57 by mill process." We are left entirely in the dark as to whether it is \$57 per pound by mill process, and \$1 by hand, or whether it is \$57 per ton by mill, and \$1 per pound by hand. In either case, the services of our mutual friend, Mr. A. B. Paul, are very much needed in Julian District, to prevent such a shocking waste of the precious metal. There must be either gross carelessness or gross dishonesty on the part of the millers of such rich ore, for the difference between \$1 per pound and \$57 per ton is something enormous—say only \$1,943. Perhaps, it might be mildly suggested that there is no dishonesty or carelessness in the working of the ore, but that the discrepancy shows the need of more accuracy of statement on the part of the mining correspondent. If this is not the true cause, Mr. Paul should visit that district without delay.

T. T.

We suppose that the "\$57" was so much per ton; and there need be no difficulty in accounting for the wide margin between the \$1 per pound and \$57 per ton, if we suppose the "pound" was simply a "specimen." As remarked by "T. T." there is "need of more accuracy of statement on the part of mining correspondents."

## Wandered to the Left.

EDS. PRESS:—I see in the late daily papers of San Francisco, an account of the wanderings of a young girl in Sonoma county, Miss Steen, residing at Garcia's mills, who was found, after four days' search, seven miles from the point from whence she started on her return home, and far to the left of the true course. This

seems a substantial confirmation of the theory advanced a few weeks since in your columns, and a refutation of the opposite opinion expressed by your correspondent "Curiosity" and a certain lecturer, as to which side a person would be inclined to walk under similar circumstances. The situation of Miss Steen, lost in the woods, without path or road to which she had been accustomed, is precisely the one I proposed to your correspondent as an experiment that would be conclusive on this point. He has been saved the trouble of trying it for himself, however, by the experience of the young lady above mentioned. He will find a full account of the event in a late number of the *Alta*. If his "curiosity" is not thereby wholly satisfied he can still continue his experiments until it is. If properly and fairly conducted, they can have only the result above given, in the opinion of

PHILO SOPHOS.

Shermantown, Nev., Aug. 8th, 1871.

## The Hell Gate Obstructions.

BY OUR NEW YORK EDITOR.

The Blossom Rock Plan Being Tried There.

From a time to which the memory of man reached not, our venerated Uncle Samuel has been at work removing obstructions from Hell Gate at the entrance of New York harbor. Divers, drills, gun powder, nitro-glycerine, dynamite, dualin and nobody-under-the-sun-knows-what not—have been tried, and lots of money

sunk in rendering the passage to the sound reasonably safe. But Hell Gate, opening its jaws for all that came, took the powder and nitro-glycerine with as much complacency as it did the vessels afterwards. Nothing came amiss.

Visit to the Works.

Uncle Sam is patient, but his long suffering has an end. Now he proposes to "go for" Hell Gate and "knock the bottom out of it." In other words he proposes to treat the obstructions to a dose of the same medicine which "settled" Blossom Rock so effectually. To do this, a large shaft or rather a pit, for such it seems when looking into it, has been sunk near low-water mark at a point near the obstructions. This shaft is nearly egg shaped with the side toward the shore very much flattened. One side may be said to be against the shore, as there is no water on the land side at low tide. This high hole is now a trifle above 31 feet deep, though some places may go as much as 35 or 36.

On the water side, headings, drifts, tunnels, or whatever the mining men call them, are being put into the solid rock. Beg pardon we did not mean it for from appearances the gneiss, as it is called, did not appear to us of a very formidable character. It is filled with perpendicular seams or lines of cleavage, and, taken all in all, would not strike an Eastern man as very hard stuff to deal with. Still the powers that be say its tough and we suppose that settles the question for all time. In a good many places salt water is finding its way through the rock in such quantities as to suggest to a stranger the question of safety. At several places we noticed that a wall of rock had been laid up carefully in cement, apparently because the natural rock was too weak to stand the pressure. Two only of the openings beneath the river were dry,—that is to say were not raining from the roof. At one of

these named, if our memory is correct, "Grant," we found a board nailed to the rock stating that the floor was 31 feet below mean low water, the dimensions 22x13 feet, and that it extended beneath the river a horizontal distance of 320 feet. We believe the latter fact because the board told us so, and not because of any measurements on our part. If it had been proper to guess how far the heading had advanced we should have said about half as much.

Plan of the Underground Work.

I send you herewith a diagram of the drifts and galleries which are now being run. The tunnel headings average 20 feet in height by 13 in width. The concentric galleries average 16 feet in height by 10 in width. The shaft or pit is 105 feet in length—its breadth being considerably less. From this shaft radiate ten headings as shown in the diagram annexed, which have been driven to various lengths; the first and tenth headings following the proposed shore line. The headings are to be crossed by galleries, and the piers left standing are to be penetrated by chambers, having a ground plan of the form of the letter T, as shown in three of the piers. In these chambers the final charges will be placed and fired, when it is expected the entire mass of rock, left standing after the cuttings, will be broken in pieces of such a size that they can easily be lifted and removed. The principal portion, in fact, practically the whole of the work, has been done by Cornish miners, imported for the purpose, and with hand drills.

On the Surface.

There were no engineers about, and everything looked as though all went to sleep as soon as possible after each meal. There were men loafing about, one of whom seemed very busy teaching a dog to bring chips out of the water as fast as they were thrown in. Another man was doing the "heavy looking on," and much interested. Doggy did not see the propriety of rescuing the same chip three times in succession, and accordingly ran off with it, thrust it into a hole beneath the timber-work, and looked about for more government work to do, whereupon we all felt called upon to go and look at the hole. Doggy immediately signified his intention of eating up all strangers and visitors and was promptly chained beneath a new steam-boiler not yet in use.

Somebody just then brought a quantity of newly sharpened drills to be lowered down. For a minute there was a small scramble for the tools at the bottom and then all was moving along properly. The men who handled the drills seemed pretty well occupied, but even they did not appear at all troubled by their exertions.

Long "dumps" of stone with railway tracks along their crests stretched away from the opening across the lowland to the shore. A big dump car close by the derrick looked very ready to carry away stone if there was any to be moved; but its office was apparently a sinecure, for a time at least.

We asked a few questions as possible, because they seemed to disturb the quiet of the spot and we did not like to presume too much.

The Return.

Five o'clock came and we hurried off to catch the boat. We reached a turn in the road where the landing was in sight, just in season to see the boat leave the wharf. We were sold. It was the last boat down. We rush for the ferry boat, built we judge, in the time of Fulton, from remnants of Hudson's original galliot. We succeed in getting on board and cross over to Yorkville. A half-mile walk, uphill, brings us to the 3d Avenue cars, and we rattle home in those well-known advertising mediums.

As to our opinion of the works in progress, we would say that they will be a grand success sometime; and there is no doubt that when the rocks do get their final charge of powder they will be completely demolished. We only ask when?

NEW ENGLAND EARTHQUAKES.—W. T. Brigham states that, since 1638, 227 earthquakes have been recorded as happening in New England, and four previous ones are mentioned in Indian traditions. He thinks that probably there were once volcanoes in New England, and particularly in Connecticut. Prof. Dana dissents from this opinion.

FIRES IN THE MOUNTAINS.—Thus far this season notwithstanding the unusual dryness, the farmers have suffered much less than for two or three past seasons from fires in their fields. We hear of some fires in the Coast Range mountains, however, which are destroying much timber.

sight never to be forgotten and unsurpassed by any scenery on our Continent.

[Our correspondent gives descriptive notices of Arey's furnace and Bruckner's revolving furnace (which have already been illustrated in the Press,) and Krom's dry concentrator, also previously described, all of which are reported to be in useful operation. We have a list of figures to show the economical working of these furnaces but the schedules are too lengthy for publication in this connection.—Eds. PRESS.]

Mines.

The TERRIBLE MINE said to be the best in the Territory, is situated about four miles from Georgetown on Clear Creek, at a small place known as Brownville. I received a pass from the superintendent, R. O. Old, and went up some 300 feet from the road and entered the main tunnel with the foreman, H. F. Lampshire.

We passed in some 130 feet which was run by the well-known Burleigh drill in 1869. From this point the company used hand drills and run 230 feet where we come to a drift running east and west. This cost \$42.50 per foot. The west drift is in some 90 feet on the lode, the company having struck the main lode at A, as represented in our diagram, some 360 feet from the entrance. The total number of hands employed is thirty-six men in the British Co., and eight men in the Philadelphia Co., the mine being owned between the two companies.

The lode, or crevice, will average four inches and where it is only two inches it is very rich and yields largely. I see it stated by the superintendent that with the present amount of ground that can be worked the mine will yield per month 15 tons of 1st class, 60 of 2d class, 100 of 3d class ore; a total of 175 tons. The 3d class pays the expense of mining the ore. They will put on more men at an early day and this will make the amount much larger. The stoped ground that has been worked will not make over 200 feet square on the lode, this being all the work done on the mine for the large amount of money that

# MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**Miner, Aug. 5th:** The Exchequer mine is now yielding a large amount of the richest of Ruby ore. They have several stopes opened out where the ore shows in abundance. The ledge is several feet thick in the various levels, and they have exposed at least 170 ft. in depth on this chimney.

### BUTTE COUNTY.

**QUARTZ MILL BURNED.**—Oroville Record, Aug. 12th: The fine quartz mill of Mr. Nisbet, at Oregon City, was destroyed last Sunday night by fire. There was an insurance of \$8,000 on the property.

### EL DORADO COUNTY.

**RICH.**—Placerville Democrat, Aug. 12th: We have been shown some very rich masses of cement, taken from the claim of Gignac, on Texas Hill.

**H. Louis & Co.,** on Quartz Hill, are still taking out of their claim immensely rich rock and prospects are that they will yet find richer.

### INYO COUNTY.

**BULLION SHIPMENT.**—Independence Independent, Aug. 5th: Four bars of bullion were shipped from the mill of Hiskey & Walker, Deep Spring; two, each on the 8th and 31st of July, the whole weighing 464 ounces, valued at \$335.

**DEEP SPRING VALLEY.**—Hiskey & Walker running a tunnel for the Julia Dean ledge, are in 160 feet. They have struck a fine stream of water in this tunnel, and in a few days expect to reach the ledge. This is the first time in that camp, or in fact any of our mines, that water has ever been struck in mining tunnels and is therefore something remarkable. They intend putting up an engine and Mr. Walker has gone to Silver Peak to obtain one.

**THE CERRO GORDO FURNACE.**—Belshaw's furnace is running continuously; Beaudry's has just shut down for repairs. At these two furnaces there are now 7,000 bars of bullion on hand awaiting transportation.

### NEVADA COUNTY.

**CHINAMEN ROBBED.**—Grass Valley Union, Aug. 14th: Chinamen have been working in the bed of Wolf creek, below Allison Ranch, cleaned up their sluice boxes last Friday afternoon and just as they concluded two robbers stepped out of the chapparal and cleaned out the Chinamen.

**MINING LOCATIONS.**—Fuller & Co. have located 1,000 square feet of ground in Omega mining district in Washington township. The same Co. has located the same quantity of ground on Coyote ravine, in the same district.

### PLACER COUNTY.

**DILLION MINE.**—Auhurn Herald, Aug. 12th: The shaft is down 60 feet. The ledge, four feet wide, is square in the bottom with well defined wall rock. The owners, Dillion, Cowan & Hines, have just had fifty tons of the rock milled at the Green Emigrant mill which yielded \$29 per ton.

**SHIPLEY MINE.**—A new shaft has been sunk and from it a drift along the ledge is being run to the old Stinger shaft, where the lode is ten feet wide and rich. This shaft will be reached in some 20 or 30 ft. more. The air in the old shaft is so bad that it cannot be worked until a current of fresh air is got through it from the new shaft and drift. When this is effected, say in a week or two, the mine will furnish all the quartz the ten stamp mill belonging to the same company can work. The size of the ledge and convenient location of the mill enables the company to mine and mill the quartz at a total cost of only four dollars per ton, and many crushings from the ledge has yielded as high as \$20 to \$30 per ton.

**DIVIDED.**—The Rising Sun Co., of Colfax, last Saturday declared a dividend of \$3.50 per foot for the month of July. Their gross yield for the month amounted to over \$15,000.

The Cox & Denton Co. have struck a large deposit of very rich rock.

### SAN DIEGO COUNTY.

**MR. J. M. TIERNAU** of the McMechan mill brought from Julian yesterday a very fine specimen of gold bearing quartz out of the Redman mine. The ledge is about five feet in width and the shaft 78 feet deep. It is estimated that if the ore was all as good as this it would be worth \$20,000 to the ton.

**GOLD DUST.**—W. F. & Co. s Express shipped Aug. 20th gold dust amounting to \$300. No bullion was shipped, owing to the mills being stopped at Julian and Banner during the past two or three weeks.

**THE ANTELOPE MILL.**—Banner District, will commence running on Monday next.

**JULIAN DISTRICT.**—The mills are all running on good paying ore. Gunn, Reynolds & Co.'s mill, and McMechan's mill, are running night and day. Gunn's mill has just cleaned up 25 tons of "San Diego," which ran over \$20 per ton. He commenced on the 28th on 150 tons of "Helvetia." The "Stonewall" mill runs a few hours every day. They are getting water, and will soon run steady. The Stonewall shaft is down 80 ft., with a tunnel in 160 ft. in one direction, and 184 in another.

### SIERRA COUNTY.

**SOLD.**—Downieville Messenger, Aug. 12: It is rumored that the Independence mine has been sold to English capitalists for \$300,000.

### SISKIYOU COUNTY.

**AN IMPORTANT MINING ENTERPRISE,** is now on foot for fluming Yreka Creek. The business of Burgess and Edgerton at S. F. recently was to enlist capital and capitalists to aid in this great enterprise. They met with encouragement and since their return have secured, under bond, the privilege of purchasing at or before a certain date, for certain specified sums, the Big Ditch, Yreka Creek Ditch and the Upper Greenhorn Ditch, and all the claims—mining or agricultural—along the line of the contemplated flume, except that of Mr. Blake. The aggregate amount required for these purchases is about \$50,000. It is estimated that the cost of bringing the flume up to a point where it is believed it will pay its way and even a profit, including \$50,000 for the above specified purchases, will be about \$150,000. Of this amount S. F. capitalists will furnish \$130,000, if the remaining \$20,000 can be raised here. This was promised on the condition of course, that they find matters as represented by Burgess and Edgerton. After securing the \$20,000 to be raised here, they will be notified, when they will send a surveyor and gravel mining expert to make a survey of the ground to ascertain the amount of fall that can be obtained, and to prospect the dirt to ascertain its richness. Upon the report made by these persons, the S. F. capitalists will decide whether they will invest in the enterprise.

## Nevada.

### COPE DISTRICT.

**RAILROAD DISTRICT.**—Elko Ind. Aug. 12: A writer August 8th, from Railroad City, says: Our Kentucky really looks like a big ledge of milling ore, and shows as well as the Industry mine, which has a splendid, well developed ledge of four feet in width, and the finest ore you ever laid eyes on.

### ELY DISTRICT.

**BULLION.**—Ely Record, Aug. 10th: The bullion shipment for July amounts to 194 bars—\$306,469.43.

### EUREKA DISTRICT.

**CHAMPION MINE AT DIAMOND.**—Eureka Sentinel, Aug. 11th: We were presented, with a beautiful specimen of ore obtained at 100 feet deep in the Champion mine. It is valued at \$700 per ton. Two hundred and fifty tons now on the dumps, it is certain will exceed \$150 per ton. Those who have examined Diamond District speak very highly of it and prophecy for a very bright future.

**THE NEW FURNACE OF THE PHENIX COMPANY** will give to the market a larger amount of bullion, and of higher grade, than the old furnaces of the same size. The mines are continually yielding the richest ores and in quantity that will render the building of another furnace a necessity.

**IMPROVEMENT.**—One of the Buttercup Co. furnaces has been running for some days, since the improvement of the syphon was added. The Supt., Col. Robbins, says it saves all trouble from "sows" and clogging, and that the metal can be taken out regularly without trouble and labor of "barring" that has accompanied getting the metal from the furnace. In a few days the other furnaces will be running and the Buttercup Co. will use the ore that has for months been accumulating at their mines.

**GOOD PROSPECTS.**—Mary Ann series of mines, consisting of the Mary Ann, Peabody, Robert Lee and Red Jacket, on the west side of Prospect Hill, have for a long time past been lying idle, for the reason that a company is about to be formed to work the mines, with capital sufficient to prove them. Many assays, principally gold, of the Mary Ann, went over \$50,000 to the ton, and one assay was \$57,605. There are now about 50 tons of ore on the dump of high grade.

**MAGNOLIA MINES.**—Same of 8th: Six men are at work with the best prospects of success.

**FISH CREEK DISTRICT.**—Same of 6th: Specimens of ore from the Kate Kline ledge, by assay of D. Lundbom, shows \$882.82 in silver, and \$10.04 in gold—total \$892.86. H. Anderson and C. Fall, owners.

### HUMBOLDT.

**NEW FURNACE.**—Winnemucca Register, Aug. 12: The Phoenix S. M. Co. is erecting a new furnace.

**NEW MILL.**—S. F. parties have purchased a mill site below the Consolidated furnace, and purpose to erect 20 stamps immediately. The milling ores of this district are attracting attention from capitalists, and we shall not be surprised to see this vicinity lead all other places in a few months in the amount of silver bars produced, as it does now all other places on the continent in base bullion.

**LARGEST SALE IN THE DISTRICT.**—The valuable mining and landed property of Geddes & Bertrand, situated in Secret Cañon, has been sold to S. F. capitalists.

**ANOTHER SALE.**—It is stated that the Richmond M. Co. has disposed of all their property in this district to a co. in London.

**THE PHENIX S. M. Co.** of this place, has levied an assessment of 50 cents per share. Cause, new furnace and purchase of mines. Lots of ore at the dumps, however.

**BULLION.**—Austin Revue, Aug. 15: Paxton & Co. yesterday shipped to S. F., 4 bars from Citizens' mill, \$5,489.52, 341 pounds. Also 22 bars from the Canfield—\$14,151.52. W. F. & Co. shipped last month 20 bars—\$15,027.15, mostly from Belmont.

**INTRIGUE MINE.**—Work has been resumed on this mine situated at S. F. Cañon. The water is to be pumped out and hoisting works are to be erected at an early day.

**MORE ORE** is on the dumps on Lander Hill than ever before, reports recorder Craycroft. If outside ore continues to increase here it is doubtful if the two mills will be sufficient.

**BULLION.**—Unionville Silver State, Aug. 12th: The Arizona mine shipped since our last \$7,564.

**SALE.**—It is rumored that S. F. parties have bought the Arizona and Sheba mines.

### WASHOE.

**BULLION RECEIPTS.**—Virginia Enterprise, Aug. 9th: Last Saturday there was deposited at the Bank of California in this city, \$106,000 in silver bars; on Monday \$19,000; yesterday, (Crown Point Co.) \$29,000, making a total of \$154,000 for the past three days.

**NEW REDUCTION WORKS.**—S. Fountain, is drawing plans for the largest mill in the State, to be erected by the Union Mill Co. on Carson river, between Eureka and S. F. mills. It is to be running in 4 months. Area 200 ft. square, crushing capacity 175 tons per day. A turbine wheel of 240 horse power is being made 20 ft. fall. Some 12 large size will be used.

**GOLD HILL NEWS.** Aug. 12th: The new Ophir shaft is down 900 ft., and sinking at the rate of 20 feet per week, in favorable rock.

### WHITE PINE.

**BULLION.**—News, Aug. 5th: The total shipment for July, East, 122 bars—\$135,850.41; West, 18 bars—\$20,850.89; Total 140 bars—\$156,701.29. Shipment for week ending to day 31 bars, 2,690—\$41,058.30.

The International mill is running half force, for lack of water. A large tank is to be built to catch water, and serve to supply the other thirty stamps a part of the time. Two new boilers are to be added. The Applegarth springs will be brought into use soon, to supply water.

**NORTH AURORA** is still choked up with good ore, which is being hoisted to the surface as rapidly as circumstances will permit.

A CAVE in the South Aurora resulted in the death of Joseph Knight.

**EBERHARDT.**—The ore in the bottom of the prospect shaft is coming in, in a slightly increased quantity. Working 30 men.

**SOUTH AURORA.**—Still sinking the shaft in the Autumn chamber. Bottom of the shaft in ledge matter, with strong indications of ore. The three drifts from the main tunnel are also in ledge matter. Working 100 men.

**WARD BEECHER CONSOLIDATED.**—The ore body in the main chamber vastly improved since our last review. The new prospect shaft 100 feet north of the present workings, is down 105 feet, the bottom being in ore. A drift is being cut from this shaft, to strike the main ore channel. Have struck a body of ore at the northern extremity of the main workings, assaying \$800 per ton. Shipping daily 38 tons to the Manhattan mill. Only one class is made of the ore, average \$55 per ton. Working 65 men.

**O. H. TREASURE.**—Have ceased for a time the shipment of ore to the Big Smoky still shipping ore to the Swansea. Working 70 men.

**SILVER WAVE.**—Drifting has been commenced from the bottom of the prospect shaft. Hoisting a small quantity of ore, and expect soon to reach main ore channel. Working 15 men.

**POST-HOLE, SUMMIT AND NEVADA.**—Hoisting ore and shipping to Big Smoky mill. Mines gaining rapidly on the mill. Working 8 men.

**MAMMOTH.**—Good ore in the dumps, and improved ore in the drift from the main shaft.

**POSTAGE.**—Still working in a fine body of ore in the shaft. Will commence milling shortly.

**ST. JOHN DEL-REY.**—Getting out small quantity of good ore, and thoroughly prospecting the mine.

**NOONDAY.**—Cross-cutting the ledge at the 140 foot level. Will soon commence milling ore. Working 4 men.

**SILVER WEDGE.**—Drift from prospect shaft struck the ledge last Monday. Two feet of good ore appears in the drift dipping east.

**EAST SHEBOYGAN.**—Mine looking well. Working small forces and getting out ore.

**GEN. LEE.**—A rich strike was made in this mine one week since. A large body of good ore is disclosed on the east of the main ore chamber. There is a large amount of ore on the dumps, and everything in connection with the working of the mine bears a flattering appearance. Will mill ore soon.

**SUNNYSIDE.**—Situated on the south slope of Treasure Hill. The tunnel is now in a chamber of ore of a breast of 15 feet in width. New drift commenced, running east. Shipping ore to the Big Smoky mill.

**GREAT WESTERN.**—A force of men was put to work on this mine during the present week. The mine will be thoroughly prospected, and opened, and the prospect is flattering, for a rich and permanent mine.

**SILVER PLATE.**—A body of ore was struck during the present week, which it is estimated will work \$1,500 per ton.

Taking out ore and shipping to Big Smoky. Working 4 men.

**BASE METAL MINES.**—Trench. —Now shipping ore to the Big Smoky mill which averages, pulp assay, close on to \$400 per ton... Caroline. —A lot of ore worked this week averaged \$800 per ton... Bald Eagle—Hoisting ore for milling. Working 5 men... Enterprise. —Ore assaying on an average of \$108 per ton. Working 3 men, and will soon increase the force... C. T. Fay. —175 tons of fine ore on the dumps. Working 8 men.

## Colorado.

**CLEAR CREEK Co.**—Cor. Central City Register Aug. 9: The lodes worked by the Baker Co. are yielding a partial supply for their cylinders. The Baker mine is working 14 miners. The mill is running.

**THE ARRY FURNACE** is a splendid success. Assays so far show that from 77 to 91 per cent. of the silver in heavy ores, and as high as 98 per cent. in light ones, is chloridized.

**MINING AT EMPIRE.**—The Callery Bros. have reached a good paying vein on the Cashier Lode, on Codove mountains, near Lower Empire. An adit has been driven in on the vein 60 feet, showing in the face eight inches of first class ore that averages five ozs. of gold and 13 ozs. of silver, per ton, and 12 inches of second class ore.

**BOULDER Co.**—The recent discovery of a silver vein of great reputed richness, is again calling attention to Gold Hill. Arrangements are perfected for the cupola furnace at the Frenchman's ranch on the North Boulder. For a supply of ore reference is made to the "Blue Bird," the "White Cloud," the "Western Slope," and the "Mountain Witch," all near, and developments the most encouraging progressing. The Caribon mine never before looked so well as at the present time. The main shaft is now 195 feet deep. In the bottom it shows 3 feet of rich black sulphurets, wider and richer than at any point above.

**HARPER'S claim** on the California, at a depth of 370 feet, is showing splendidly. From the shaft west a drift has been driven 44 feet, disclosing a fine vein of smelting ore in the breast—12 inches in width—and about three feet of stamp-mill ore. In the east drift, a crevice of first-class ore three feet in width is the most interesting feature. The first-class ore in the back-stopes over both drifts, averages two feet in thickness the entire length of the claim, with a crevice of second-class ore that varies in width from three to five feet. The first-class smelting ore sells at from \$100 to \$110 per ton; the second class is \$45 per ton, and the third-class under stamps yields from five to seven ounces per cord.

**IN CALIFORNIA GULCH** the stamp mill is steadily at work on Printer Boy ore, which pays ten ozs. per cord. Breeze & Co. will soon put up

two arastras. Mr. Dyer has two on Iowa gulch, and Dickerson & Co. have three about ready to run.

THE STRACUSE is producing considerable ore, some rated at \$500 per ton.

Forty sacks of ore from the Western Slope lode assayed, showed silver at the rate of \$213 per ton.

DAYTON, on Middle Boulder Creek, Grand Island district, the new mining town, is growing rapidly. Machinery is arriving for Cutter's reduction works.

A GREAT STRIKE is reported at the bottom of Caribou's main shaft, 42 inches of ore, full of sulphurets of silver and native silver.

CARIBOU.—Golden Transcript, Aug. 9:—We have reports from Caribou that among the best mines in that district are the "Western Slope," and the "Blue Bird." Three tons of ore from near the surface netted them \$230 per ton. The shaft on the Western Slope is 25 feet down, and that upon the Blue Bird over 15 feet.

From the Caribou Post, Aug. 5th:—Work is continued on the Mountain Witch, near the French boys' ranch, and reported opening splendidly. The whole crevice is six feet in width, and the seam of pure, hard mineral, is constantly increasing in thickness as depth is attained.

### Idaho.

BULLION.—W. F. & Co. shipped from here the past week, 9 bars of bullion \$11,459.60.

MAHOGANY.—Silver City *Analanche*, Aug. 9th: A 3 ft., ledge has been struck in the lower works of the Mahogany. Free gold and silver are discernible throughout the entire width. Stockholders jubilant.

FRENCH CREEK.—Boise, *Statesman*, Aug. 5th: Small & Co. are taking good pay, say \$12 to \$15 per day to the hand. Many Chinamen are working on the creek.

At Cow Creek, Manlie and Lawson have made a good stake and started for the Old States, having sold their claims to Armstrong & Co.

GRANITE CREEK.—Idaho *World*, Aug. 5th: John Eissler has at length struck his ledge after running his tunnel 465 ft. The vein is now over five feet wide, with both walls solid and well defined, and the ore thoroughly sprinkled with free gold. It is regarded as about the richest ledge ever discovered in this county, as it doubtless is the widest, at least of the gold ledges.

New discoveries in quartz are being made, and Granite Creek may prove the banner quartz mining camp in the Territory.

### Montana.

BOULDER DIGGINGS.—Helena *Gazette* Aug. 7th: The Boulder Bar diggings, in Jefferson county have proved to be good. Mining is profitable on this bar, and promises fair remuneration.

BOHM'S SILVER WORKS.—At Argenta are in splendid order, running night and day, and producing 1½ to 2 tons per day of matt.

NEW LEDGE.—Judge Clancy, has struck a rich and valuable ledge at Radersburg, another proof of its value as a great mining camp.

SLICES ROBBED.—Mr. Poor and his partner, on Boulder Bar had their sluice-boxes robbed one day last week, of about \$500 in amalgam. A suspected company of Chinamen have "vamosed."

RED MOUNTAIN.—There are now four or five arastras running on rock from the Nevins and Only Chance lodes, night and day. The yield is immense, and the owners have splendid fortunes in prospect. Moose creek, two miles from Red Mountain city, best places in the Territory, with the miners profitably engaged in taking out gold worth \$20 per ounce. The arastra of Dickey and Parks, is grinding on good gold quartz procured on that side of the range out of a vein of great thickness; the rock pays \$20 per ton, and they crush three tons per day.

A TIN MINE.—Is reported as having been discovered near Helena. The ore is 95 per cent. fine metal, and is found from a point several miles up Lump Gulch, to Dana's Bar.

YAMHILL.—Dear Lodge City *Independent*, Aug. 4th: Kelley, Brown & Thornton cleaned up last week over \$800; this was from new ground on Gold Hill. Fagan, Brady & Co., have been making large clean-ups all summer. There are ten hydraulics now running on the Bar and they will have an abundance of water this season.

John McGrath, of the American Bar diggings, below Brundy's Mill, says that the miners there have commenced washing up, with good results. He sold some 40 oz. of dust, at Donnell & Co.'s Bank to-day, for \$19.50 per oz.

LINCOLN.—Helena *Herald*, Aug. 3d: Nearly all the claims worked are paying, some over wages, while some go as high as \$40 to the hand per day. There are five

whims running, and some ground sluicing being done.

NEW LEDGE.—We were yesterday shown at the office of Charles Rmley, assayer, a gold brick weighing 126.85 ozs., 378 fine, and possessing a gross value of \$2,302.31, the result of fifty-seven tons of rock from the Left Hand Ledge, Radersburg District.

PHILIPSBURG.—Cor. New *North West* Aug. 5th: A train of 16 wagons left Philipshurg to day, loaded with nearly 50,000 pounds of crushed Spockled Trout ore, delivered to the First National bank of Helena.

### Utah.

BULLION.—Salt Lake *Tribune*, Aug. 12th: W. F. & Co., shipped to N. Y., from their office in this city yesterday, 7 bars, from the works of Raymond & Ely at Piocho, Nev.,—\$16,335.52; also from the Meadow Valley Works 9 bars, \$12,133.07.

UTAH M. & T. Co.—This Co. has a location in Little Cottonwood, on the Emma Hill, which is said to be one of the best locations for a tunnel in the district. They are in 140 ft. Indications are favorable. The drift is intended to cut the Emma, Savage and Flagstaff veins, and other bodies of ore. Have some \$6,000 in treasure; K. Y. Anderson supt.

CAMP FLOYD.—Yesterday, A. C. Tichenor of Camp Floyd District, showed us a very beautiful specimen of cinnabar from the Bowers ledge, situated between the Sparrow Hawk and Silver Cloud mines. Shaft 40 feet down and displays a breast of ore 30 ft. The ledge runs in a north and south direction and crops out. Assays give 10 to 27 per cent. mineral.

The following is a list of the principal silver mines in the district as given by Mr. Tichenor: Sparrow Hawk, Silver Cloud, Union, Golden Chariot, Silver Sceptre, Queen of the West, Silver Serpent, Grecian Bend, Mormon Chief, Waterfall, Benton and Robert Emmet. The ore of this district is all adapted to the milling treatment and varies in its assay value all the way from \$100 to \$700 to the ton.

A PROMISING "LITTLE FRED."—Wallace & Murdoch, while on a visit to Silver Springs, Big Cottonwood Canon, discovered one of the most promising ledges that has been found in Silver Fork or vicinity. A wide, well-defined crevice, carrying 30 to 36 inches of rich ochre interspersed with iron, is now in sight, and the vein has every indication of yielding within a few days argentiferous ore in large quantity. The assured early erection of the smelting works at Silver Springs, will favorably affect all mines in that district.

LITTLE COTTONWOOD MINES.—The Montezuma and Savage are classed by experts among the extraordinary. The Flagstaff mine, the second in the Territory, is looking even better than was anticipated, particularly in the new drifts. Little Cottonwood bids fair to remain in the front rank of mineral districts as to productiveness and in the value of its ores.

BINGHAM CANON.—Cor. of the Same: The Yosemite mine owned by May & Merrill, has a shaft and a clearly defined fissure vein four feet with ore assaying about 60 per cent. lead and 20 to 30 ounces silver per ton. The Winnemucca mine worked by Daggart & Bristol has been explored to the depth of 318 feet, on the varying dips of the lode reaching a vertical depth of over 200 ft. They have a vein of ore 17 feet in thickness, ranging in value from fifty to sixty ounces in silver per ton.

The Kelsey Tunnel Co. are running to reach eight mineral veins that they own, all within 1,000 ft. of the face of the tunnel. Have crossed two, one being over nine feet. This tunnel is now over 250 ft. in length, reaching a vertical depth of over 300 feet. The Fliess and the Miner's Home, give promise of becoming paying institutions, as the veins are very large and the ore of good grade.

Howard & Co. have completed a water ditch four miles long and put up a hydraulic power. Peter Clays is opening the gulch. The shaft is now down some 70 feet and the engine and pumps in course of erection. He hopes to reach the bed-rock in the course of three weeks.

Lion Hill District which is far famed and immensely rich, has its reputation enhanced by every day's development. Gigantic tunnel operations are commenced.

MESSRS. DEWEY & Co.—Gentlemen: Your favor of the 7th inst. is at hand with the patent for my anti-incrustator. Many thanks for your promptness and business-like manner of conducting the matter to a successful result.

Yours truly,

W. T. RICKARD.

Monitor, Alpine Co. Cal., Aug. 10, 1871.

### Mining Stock Market.

[San Francisco Stock and Exchange Board.]

THURSDAY EVE., AUG. 17, 1871.

The mining stock market has been characterized by a very fair degree of activity since our previous reference, and, as a general thing, prices show an upward tendency. It may be noted that stocks did not show any violent fluctuations, apparently manifesting a gradual and healthy appreciation. We notice that the Chairman of one of the successful English mining companies located in White Pine, at a recent meeting in London, made some very sensible remarks upon the numerous offerings of mining properties in that market. While some of these properties are undoubtedly "wild cat," others are recommended by assays showing a very high grade of ore, the parties never intimating that such ores are exceedingly rebellious, and, therefore, cannot be profitably reduced by the ordinary methods in vogue. We very much fear that these numerous and indiscriminate offers will have a tendency to prevent English capital from entering into such mining enterprises on this coast that have real substantial merit, and only need the careful assistance so proverbial among English capitalists. Let us offer nothing but good mines, and the needed help to develop them will not be wanting.

The sales in the San Francisco Stock Board, from August 10th to the 16th, inclusive, have been as follows:

90 shares Alpha at \$8 25/100	55 shares Amador at \$25 25/100	2315 shares Belcher at \$22 1/2 25/100	3565 shares Buckeye at \$1 5/8 25/100	2535 shares Caledonia at \$1 3/4 25/100	6443 shares Chollar-Potosi at \$30 1/2 25/100	73 shares Crown Point at \$30 1/2 25/100	1295 shares Eureka at \$1 1/2 25/100	4755 shares Eureka Consolidated at \$16 1/2 75 1/100	487 shares Gould & Curry at \$102 50/100	1710 shares Golden Chariot at \$17 1/2 25/100	450 shares Hale & Norcross at \$10 1/2 25/100	35 shares Imperial at \$29 25/100	371 shares Kentuck at \$106 1/2 100 50/100	1070 shares Ida Elmore at \$10 1/2 25/100	80 shares Lady Bryan at \$3 25/100	4335 shares Meadow Valley at \$22 1/2 25/100	2875 shares Mammoth at \$25 25/100	1550 shares Malopago at \$10 50/100	400 shares Monitor and Magnet at \$1 5/8 25/100	530 shares Noonday at \$3 1/2 25/100	2100 shares Ophir's Hidden Treasure at \$9 50/100	420 shares Overman at \$6 1/2 25/100	10,034 shares Ophir at \$13 1/2 25/100	2245 shares Potosi at \$10 1/2 25/100	7375 shares Phoenix at \$2 1/2 25/100	3610 shares Raymond & Ely at \$12 1/2 25/100	1234 shares Savage at \$34 1/2 25/100	3885 shares Succor at \$1 75/100	5500 shares Yellow Jacket at \$1 50/100	430 shares Consolidated Virginia at \$7 50/100	320 shares Segregated Belcher at \$8 25/100	155 shares Sierra Nevada at \$3 1/2 25/100	100 shares Daney at \$3 1/2 25/100	675 shares Yule Gravel at \$11 25/100	200 shares Marble Falls at \$1 25/100	500 shares St. Patrick at \$2 1/2 25/100	100 shares Pioneer Land and Loan Co. at \$102 1/2 100/100

CHOLLAR-POTOSI—sold to a fair extent at advancing rates. They extracted 1,020 tons of ore during the week ending August 12th, valued at \$50 20 per ton, against 1,067 tons valued at \$43 37 per ton the previous week. CROWN POINT continues quiet. During the week closing August 13th, 1,427½ tons of ore were extracted, valued at \$30 per ton, against 1,435½ tons valued at \$32 50 per ton the previous week. In the 1,100-level the good ore is about twenty feet wide, while the balance of the vein is composed of quartz and very low-grade ore. The bullion yield for July amounts to \$199,376. HALE & NORCROSS shows a small advance under meagre sales. For the week ending August 12th, 264½ tons of ore were taken out. SAVAGE has been inactive. They extracted 546½ tons of ore for the week ending August 13th, showing an assay value of \$28 21 per ton. The bullion receipts for July aggregate \$89,965. KENTUCK receipts for July, \$20,436. GOLDEN CHARIOT receipts for July, \$45,156. RAYMOND & ELY is gaining much favor under quite large sales. The fiscal month ending August 9th is credited with a bullion product of \$92,000, being the yield of 1,027 tons of ore. A dividend of \$1 per share was paid on the 17th inst. BELCHER commands high figures. On the 14th, a clay stratum, two feet thick, running on an angle of 37 degrees, was struck in the incline. It is of good character, and has some pay in it. In the bottom of the incline some very good quartz has been found. EUREKA CONSOLIDATED will pay a dividend of \$1 per share on the 21st.

WOODLAND, July 14, 1871.

DEWEY & Co.—Gents: I received the patent paper upon my improved wagon all right, and I return thanks for the promptness with which you pushed it through. Respectfully,

C. ELLIOTT.

# Rice Culture—Leveeing, Ditching, Inundating, Etc.

CONCLUDED.

I here below represent the position of the trunk with a small part of the river, trunk-dock and ditch to the field as seen looking vertically down upon them.

The process I have described implies great experience and labor in bringing a rice plantation into cultivation.

There are however great variations in practice, where circumstances permit, tending greatly to diminish both the cost of improvement of the land and its culture.

The cultivation of an inland swamp plantation much resembles that of tide swamp, except that having no command of tide waters, the upper part of the swamp is used as a reservoir for water, which is kept there by a heavy bank made across the lower end of the reservoir, and the lower part of the swamp forms the rice field. But I have never cultivated inland swamp.

I have of course omitted many minutiae, aiming at pointing out what is essential and peculiar to the cultivation of rice here.

The bank and ditch around the land being finished, and the trunk in its place, or bed, the land can be kept dry, and the next step is to clear the land by denuding it of its natural growth. I need not state the mode of doing this. Clearing new lands for any kind of culture varies according to the crop to be cultivated. Much, in fact most of the rice land in South Carolina was originally heavy timbered, and cost much labor to clear. If on flooding the land which has been taken in and surrounded with bank and ditch, it is found to be so uneven that some large parts are more than a foot lower than the rest, it is desirable to divide it into two or more separate fields, putting the lower portion of the land in one field, and the higher portion in a separate field, as far as such a separation is practicable. The highest alluvial land is generally near the river, and the lower further back from it. (See the diagram of land divided into four rice fields.) The fields are separated from each other by a bank, which need not be as large as the large bank next to the river, and a ditch always runs around each field 15 or 20 feet distant from, and parallel to the banks. Each field has a trunk to itself. After the land is cleared it receives a further draining by cutting small ditches across the field from the ditch on one side of the field to the ditch on the other side. These small ditches are called "quarter drains," they are straight, parallel to each other, usually about 105 feet apart, and 18 inches wide by two and a half or three feet deep. When the land has been several years cultivated it will need more draining, and then two more quarter drains, dividing the field into long strips of land or heds, about 35 feet wide.

## Cultivation and Management of the Crop.

On an old rice field the land is usually ploughed, or dug with a hoe, in winter, and harrowed, or chopped fine with a hoe, towards spring. On absolutely new land this is not necessary, and if the land has many stumps and roots remaining on it, it cannot be easily done.

In preparing to sow the seed the land is drilled or trenched, on old lands sometimes with a trench plough, but usually by hand. The laborer uses a narrow hoe, about eight inches long and three or four wide at the edge, and steps backward in doing his work. In order that the drills or trenches might be straight, several rows of four or five stakes are set up across the field, the rows of stakes being five feet apart, a skillful laborer makes a trench in a line with each row of stakes, and less skillful laborers make three trenches between every two made by the first. As the work is finished in one part of the field, the stakes are shifted over to the next part until the whole field is trenched with straight parallel drills fifteen inches apart. Four hands (men) trench about three acres. The trenches are about two inches deep.

The sowing of the crop is begun after the middle of March, and continued at intervals, dependent on the spring tides, until the middle or end of May. One or more fields being trenched, you begin to sow the grain some days before the last spring tides in March, or the first of April. The seed is sown by hand, about two and a half bushels to the acre, as equally distributed along the trench as possible. Each sower (usually a woman) sows two to two and a quarter acres. Three hands follow her, covering the seeds lightly with soil thrown out in making the trench. The laborers in covering the seed, use a simple tool called a "cover-board," made of a piece of inch board, sixteen or eighteen inches long, four or five

wide, beveled at the sides and ends, and with a large auger hole in the middle to receive one end of handle five feet long. In use it is intermediate between a hoe and a rake—the light soil is drawn obliquely into the trench to cover the seed, and the clods, if any, are crushed by a smart blow with it.

As soon as a field is sown and covered, the outer door of the trunk is opened and the tide let in and the field flooded one foot or more deep. The water is kept there from three to six days—the warmer the weather the shorter the time. While the water is on the field, all the trash which floats and drifts to the bank is raked off and heaped on the bank or outside of it. A very few hands can do this while the rest are at work in another field. This flooding is called the "sprout flow," and when the water is drawn off the grains have

As soon as the field is thoroughly dry, it should be hoed again. This time it is dug as deep as practicable with a hoe about eight inches long, but not more than six inches wide, through each space or alley between the rows of rice. In digging, the sod should be turned over, and after the laborer has hoed through his task—one half acre—he goes over it again and pulls up any long grass left in the rows of rice. The field is now kept as dry as possible for twenty-two or twenty-three days after the long water, when it should be hoed again, but very shallow and superficial hoeing, so as not to injure the roots of the rice, but merely to level the clods of the former digging, and destroy the young grass. The task is half an acre, and any long grass is pulled by hand out of the rice rows as before. A day or two after the "lay by water" is put on. That is, the field is flooded to

VERTICAL SECTION OF BANK, TRUNK-DOCKS, ETC.

a—River. b—Outer Trunk-Dock. c—Inner Trunk-Dock. d—Ditch around Rice Field. e—Trunk. f—Level top of the Bank. g—Sloping sides of the Bank. h—Logs, called "string-pieces," laid across the trunk and fastened by stakes, to keep the trunk firmly in its place, and to support the earth at foot of bank.

begun to germinate. The field is then kept dry a week or more, until you can see the fine points of the rice plant coming out of the ground, visible for thirty feet along the trench. This is called the "needle state" of the rice. The field is then flooded. This is called the "point flow," and is kept on, say one foot deep, from four to eight days—the warmer the shorter the time. This flowing helps to destroy the young grass which has begun to grow, but if kept on too long is apt to stretch and weaken the rice, so that it falls down when the water is taken off. The field is then kept as dry as possible until the rice is about five inches high and has four leaves. It is then hoed for the first time. The laborer using a hoe six or seven inches wide, gives a light and very shallow digging to the surface of the land between the rows of rice, stepping forward as he works, superficially stirring the soil and cutting up any grass growing there. After hoeing through his task, he goes carefully over it, and with his hand or a short stick removes any clods which may have fallen on the rice plants. After two days, if the weather be dry, allowing that time for the sun to kill the grass which has been dug up by the hoe, or immediately if

about the same depth as marked on the trunk post, or other convenient place, lower or higher, according to the growth of the rice. Care must be taken that when the rice is "in belly," that is when the ear begins to form in the plant, that the water should not get above the swollen or enlarged part. When the plant has shot out its ear the water may be deepened, but never to beyond eighteen or twenty inches.

During this flow, which generally continues more than two months, when the rice has got strong enough to stand without the support of the water, the water is changed as often as you conveniently can. That is at every spring tide you run the water off, being certain that the next tide will be high enough to enable you to replace it with fresh water.

The crop is kept flowed this way, without any further labor, if it has been well weeded, until the rice is nearly ripe. Rice sown on the 1st of April, and well cultivated and judiciously watered, is usually ripe by the 1st of September. Sown the 15th of May it will be ripe by the end of September. The grains are now yellow, plump and pretty hard, except those toward the lower end of the ear. The water

a—Bank made over the Trunk. b—River. c—Ditch. d—Pins to secure Logs. e—Trunk.

the weather be wet, the field is again flooded. This is called the "long water." The field is deeply flowed, overtopping the rice for three or four days, and all the trash which drifts to the bank raked off as before. The water is then slackened down to about six inches deep on the general level of the field. A mark or notch is cut on the trunk post or elsewhere, and the water is kept as nearly at that height as practicable for twelve or twenty-three days, according to the quality of the land, the heavy or stiff lands requiring the longest water. The water should not be turned off at the end of fifteen days, as drying at that period is known to injure the rice. If not turned off at twelve days, it must be kept on several days over fifteen. The water is then gradually slackened off in the course of a day or two, for the rice in the lower parts of the field having been stretched and weakened by the greater depth of water there, is apt to fall down on the water being suddenly drawn off. This shows the importance of a rice field being as level as possible, otherwise the rice in the lower spots is materially injured, and in the high places the grass is not destroyed by the water. During this flow, what grass has not escaped the hoe, and was too old to be killed by the water has been growing rapidly. It is desirable, if you have time, to pull it up by hand out of the rows of rice, before or at the time you are slackening the water off the field.

should now be turned off, and the field allowed to dry for three or four days. The rice is then cut with a sickle, and laid for one or two days on the stubble, which is usually left from fourteen to eighteen inches long. It is then tied into sheaves and stacked in cocks in the field for a few days, or carried at once to the barnyard and put up in small stacks until thoroughly cured. Care must be taken that it is not tied into sheaves or stacked while damp. But I need not further particularize the mode of treating it, as it is much the same as with other small grain crops.

Without going further into detail, I will merely state that after a rice plantation is taken in and ready for cultivation, it is found here that from six to eight acres can be cultivated to the hand, the hands being the men and women of a gang of negroes, who are neither too young or too old to be efficient laborers.

On new lands of good quality, well cultivated, the crop is heavy, yielding fifty-five, sixty, or seventy bushels to the acre. On old lands, which have been cultivated in rice for fifty years or more, the yield varies from fifty to forty-five, down to thirty bushels per acre, according to the quality of the soil. On a plantation with 300 acres rice land, the 300 acres may be divided into 15 or 20 fields, and there are often 50 hands, negroes, men and women, who with children and old people will make more than 100.

THE TABLES TURNED.—There was a time when some considerable alarm was felt, on account of the earthquakes here; but if we are to credit the Eastern papers, the earthquakes, tornadoes and thunder storms in the Atlantic States are now so severe that Californians may well hesitate about going East, without first getting their lives insured, for the benefit of the friends they leave behind. The loss of property and life at a single tornado at the East has exceeded the total casualties of all the earthquakes on this coast since the memory of "the oldest inhabitant."

## PATENTS & INVENTIONS.

### Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

#### FOR THE WEEK ENDING JULY 25TH.

PARLOR-SKATE.—Chris. Raitz, San Francisco, Cal.  
FLOW.—Montgomery P. Rose, Napa, Cal.  
FURNACE FOR ROASTING ORES.—Stephen F. Amher, Monitor, Cal.  
DESULPHURIZING AND TREATING ORES.—John W. Bailey, Hamilton, Nev.  
POTATO-DIGGER.—Robert A. Haw, Bucksport, Cal.

GATE.—Edmund Higgins, Sacramento, Cal.  
ELASTIC TIRE FOR TRACTION-ENGINES.—Oliver Hyde, Oakland, Cal.

FURNACE FOR ROASTING ORES.—Richard F. Knox and Joseph Osborn, San Francisco, Cal.

COMPOUND FOR PREVENTING INCRUSTATIONS IN STEAM-BOILERS.—William T. Rickard, New Monitor, Cal.

MACHINE FOR MAKING BLIND-SLATS.—Paul Schumacher, San Francisco, Cal.

MACHINE FOR TURNING SPIRAL MOLDINGS.—Edward A. Stockton, San Francisco, Cal.

#### FOR THE WEEK ENDING AUGUST 1.

FEED-CUTTER.—Charles R. Donner, Sonoma, Cal.

CARPET-STRETCHER.—Samuel Elliott, Sonoma, Cal.

TOOL FOR ROUNDING LEATHER.—Lo Roy A. Swett, San Francisco, Cal.

SLOP-HOPPER.—John G. Iis, San Francisco, Cal.

PARLOR SKATE.—David Kerr and Asa E. Hovey, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

LOTTERY SHARKS are increasing beyond all precedent. California seems to be regarded as choice subjects for their "experiments," and our State a fine one for "gulls." Its reputation for wholesale lotteries has gone forth, and the tidal wave is returning. Probably \$100,000 has been spent for advertising alone, here, during the year past. In a single week in July over fifteen hundred thousand lottery tickets were printed by one firm. We verily believe that the gift (lottery) schemes have done more to fasten the prevailing dull times on our community than our dry seasons, or any other one cause. The New York gambling (not to say thieving) concern (that "refers" to the Nassau National Bank for its respectability,) will not be called upon to "honor" our draft "on receipt of bill and paper containing first insertion" of advertisement.—No, not for us!

CALIFORNIA BIRDS.—In California there are 18 or 20 native species of birds, more or less noted as songsters, and some of the species have many local varieties. The erroneous notion that the State was meagre in bird life, and especially singing birds, arose from the fact that the early routes of travel lay chiefly over nearly treeless plains, where few birds remain in the long dry season.

TITANIC ORE.—At the last meeting of the metal and coal trades at Swansea, a sample of titanic ore was exhibited, containing a very large percentage of titanium. An analysis gave the following results: Iron, 40.88 per cent.; oxygen, 10.57 per cent.; titanic acid, 31.72 per cent.; silica, 3.17 per cent.; lime, 0.97 per cent.; magnesia, 1.00 per cent., etc.

## USEFUL INFORMATION.

## Fallacies in Building.

To suppose that timber, growing in the woods or floating in water to-day, can be placed in a building next week, and stay where it is put.

That if such a timber be used, the walls will not crack.

That the base, window panels, casings, etc., made of such timber will not part company with the floors from one-fourth to three-fourths of an inch in less than a year, and that the builder put unseasoned lumber in the latter.

That kiln dried lumber is as good as lumber thoroughly air seasoned, or that the atmosphere has no influence upon it.

That a joint once tight will always remain so.

That if trimmings be put up before plastering, or trimmed on green walls, that putty will not be in great demand when they dry.

That hot air from a furnace will not start and open every piece of wood-work with which it comes in contact nine times out of ten.

That if partitioned be not properly braced, bridged and secured at angles, that plastering will not crack.

That ceilings are less likely to crack if cross-furred.

That a painful of time to a cart-load of sand will make mortar of any practical use either for plastering or brick work.

That it injures mortar by mixing it some time before using it, or that if mixed one day and applied the next it won't blister and crack.

That a cement roof, so soft that it fills the leadere in summer, or so hard it cracks in winter, will not occasion the want of new ceilings in a little time.

That a "botch" can build as good a building as a thorough mechanic.

That in all cases money is saved by contracting with the lowest bidder.

That all knowledge in relation to building is embodied in every one who signs "Architect" after his name.

That architects and builders never "lay in together," and owners never get "ehone" through that little arrangement.

That architects, as a rule, get no other commission on buildings except the traditional "five per cent. on the cost."

That builders always carry out plans and specifications to the letter.

That there are no high-minded conscientious, competent architects, and no honest reliable builders; and that either class does not bear a reputation equal to that of any other business men.

That a builder does not require an extended theoretical, nor an architect as extended a practical knowledge, to be successful.

That no builder can be a successful architect, or that a practical architect cannot be a successful builder.

That you, reader, without practical knowledge, know a great deal more about the details of a house than of a locomotive.

**AN ANCIENT OUTLET TO LAKE SUPERIOR** has been discovered by the Michigan State Geological Survey. This outlet is unmistakable in its character and consists of a long deep valley or depression, what we would call in California a cañon, bordered with high bluffs, and is continuous from the south shore of Lake Superior to Green Bay in Lake Michigan. The practicability of a ship canal is suggested by this discovery, and surveys will no doubt soon be made to that end. Should it be found practicable, it will greatly shorten the distance between the ports on the two lakes.

**WATERING TEAMS OFTEN.**—Horses and oxen at work need water often. The plowman carries his jug of water, or leaves his team to rest while he goes to the house for a drink. But the team works harder than the driver, and probably needs drink as often; yet many teams are taken out early in the field, where there is no water except in the driver's jug, and work five or six hours before they can get a drop. Is it any wonder that they are injured by drinking too much when they are led to the spring at noon or evening.

**RAIN IN COUNTRY AND CITY.**—Country rain and city rain, when examined chemically, affords by comparison, some interesting scientific results as to the purity and impurity of the atmosphere. Dr. August Smith, in the journal of the Scottish Meteorological Society says that the rain of towns where much coal is burned is easily

distinguished, by common observation even, from country rain. The one is clear, and colorless, the other black and muddy; the one is tasteless, the other tastes of soot; the one is neutral, the other is acid, and corrodes metals and even stones and brick, destroying mortar rapidly, and readily spoiling many colors. As the rain washes the air, which is found to be purer after a rain-fall, the impurity which goes into the water can, by chemical experiment, easily be taken out; and thus by this natural washing of the air chemists are enabled to ascertain the comparative healthiness of different localities, a pure atmosphere being an essential element of the good health of a community.

**A POPULAR ERROR CORRECTED.**—The prevailing idea entertained by the inhabitants of temperate climates as to the exceedingly gorgeous nature of tropical vegetation is far from correct. Mr. Wallace, who lived for years in the East Indies, says that in the most luxuriant parts of the tropics flowers are less effective in lending color to the landscape, than in temperate climates. While there are many grand and beautiful tropical plants, it must be remembered that the proportion they bear to the mass of the vegetation is very small.

**PLANT GROWTH IN WARM AND COLD CLIMATES.**—The active principles of plants, according to recent investigations, are more concentrated in the leaves of plants grown in cold climates where the vegetation is less vigorous, than in warm climates. In illustration the well-known facts are cited, that tobacco grown in northern regions is stronger than the same plant raised in mild or tropical regions, and celery, it is stated, is affected in the same way by the influences of temperature and moisture.

**TO KEEP FLIES FROM HORSES.**—One of the simplest means we have ever heard of keeping flies from annoying horses or cattle, is to take a bunch of smart weed, bruise it so as to cause the juice to exude. Rub the animal thoroughly with this bunch of bruised weed—especially upon his neck, legs and ears. Neither flies or other insects will trouble him for at least 24 hours. If preferred an infusion may be made by steeping the weed, and applying the liquid with a sponge.

**A NEW RESPIRATOR FOR FIREMEN.**—Prof. Tyndal, the celebrated scientist, it is said, has perfected a new respirator for firemen, in which the solid particles of the densest smoke are arrested by films of cotton-wood wetted with glycerine and the most repugnant gas by layers of charcoal. By these simple means, firemen can remain within burning buildings for upwards of half an hour at a time with safety and comfort so far as respiration is concerned.

**SPONGE PAPER** is a new article of manufacture recently patented into France. It is made of evenly and finely divided sponge added to ordinary paper pulp, and worked as in the common paper making apparatus, into sheets of different thicknesses. It is said to have all the peculiarities of sponge, absorbing water readily, and remaining moist a long time. It has been used as dressing for wounds with considerable advantage and is capable of several important technical applications.

**A HUGE ELECTRO-MAGNET.**—Wallace & Sone, of Ansonia, Connecticut, have recently delivered to the Stevens Institute of Technology, at Philadelphia, a magnet which weighs about 1,600 pounds. The coils are wound on eight brass spools; about 400 pounds of copper wire are wound on these spools, which are of course split and filled in with vulcanite. The lifting force of this magnet is estimated at between 30 and 50 tons. It is five times as powerful as the one used by Faraday and Tyndall in their famous researches.

**COOLING BY FANNING.**—The cooling effect of air blown upon the surface of the body is due mainly to the carrying away of heat by the increased amount of evaporation thereby produced. In this way the face may be sensibly cooled by forcing against it air at a temperature even above blood heat.

**STING OF INSECTS.**—An Indiana correspondent writes thus: Tell your readers that a few drops of coal oil dropped on parts stung by bees, wasps or hornets will give instant relief.

## GOOD HEALTH.

## Poisonous Flannel, Again.

**EDITORS PRESS:**—My attention has been called to an article in your issue of the 5th inst., on the poisonous quality of red flannel, and as a little circumstance connected with myself seems to fully confirm what you then said, I thought it might be of service to others to give it to you for publication.

On the first of last April my wife was taken suddenly sick, after washing; a strange feeling came upon her which she could not account for, and at the same time her arms, from the elbows down, were covered with a very singular eruption, of a scarlet color. Her neck also and from the knees down, were affected in the same manner. No other portion of the body had a single sign of eruption upon it.

She was taken sick the day following her washing, and as luck would have it, a physician called at our house and I directed his attention to this eruption upon my wife. He looked long and carefully upon the case and then remarked that it was something that he had never seen before in a practice of fifteen years. A number of our friends called, but it was new to them all.

On reading the article in your paper above referred to the whole matter was made clear to my mind. Being in the city a short time previous I bought some red flannel from which to cut letters for a sign, and having about enough left to make a pair of drawers, I proposed to my wife to make them. She did so, and after they were done I wore them, during which time I was troubled with an unusual itching, which, at the time, I attributed to fleas, but could never find any upon my person. I finally cast the drawers aside for washing, which operation was attended with the result already stated.

After she had washed them she put them in the scald and the color was immediately changed, several degrees darker. Having but one pair, I thought I would buy enough more to make another for a change. The latter have been washed several times, and are just as bright after repeated washings as they were when first made; they have not shrunk in the least, whilst the first pair are perfectly useless.

Now I am perfectly satisfied that the mystery of my wife's sickness is solved; her symptoms were the same as those of the woman spoken of in the Press, who washed a similar garment. The reason of her breaking out upon her shoulders and neck, and below the knees, I attribute to the poison being conveyed to those parts by her hands, in dressing. The instant I read that article, I was satisfied that the poison was in the flannel. The two pieces of flannel were bought at different places.

D. L. PERKINS.  
Emmotan, Sherman Island, Aug. 7th.

## How to Give Children an Appetite.

Give children an abundance of out-door exercise, fun, and frolic; make them regular in their habits, and feed them only upon plain, nourishing food, and they will seldom, if ever, complain of a lack of appetite. But keep them overtasked in school, confined closely to the house the rest of the time, frowning down every attempt at play; feed them upon rich or good-seasoned food, candies, nuts, etc., allow them to eat between meals and late in the evening, and you need not expect them to have good appetites. On the contrary, you may expect they will be pale, weak, and sickly.

Don't cram them with food when they don't want, or have no appetite for it—such a course is slow murder. If they have no appetites, encourage, and, if need be, command them to take exercise in the open air. Don't allow them to study too much, and especially keep them from reading the exciting light literature which so much abounds in our book-stores and circulating libraries. In addition to securing exercise for the children as above, change their diet somewhat; especially if they have been eating fine flour, change to coarse or Graham flour.

Sickness is the most expensive nuisance on the face of the globe. There may be instances where it makes people or children better, but generally it makes them selfish, sad, misanthropic, nervous, mean, and miserable. The way to make children happy and good is to keep them well.—*Boston Journal of Chemistry.*

## What and When to Eat.

We eat, says the *Journal of Health*, to keep warm and to sustain strength, and all articles of food have these two elements in varying proportion. Oils, tallow and whale blubber are almost wholly of the warming elements; hence in Greenland, where the thermometer is many degrees below zero, and a great deal of heat is required, a native will drink half a dozen gallons of oil every day, or eat ten pounds of tallow. In the hottest climates of the world the inhabitants live to a great extent on fruits and vegetables, which have but very little of the heating qualities. In our climate, which is between the two, meats, vegetables and fruits are eaten all the year round; but if eaten judiciously, if eaten according to the season—more of fruits and vegetables in summer and less of meats and fats—an incalculable amount of sickness would be prevented every year. We would think a man deranged who should keep as large fires burning in his house in summer as in winter, and yet we all persist in eating meats and fats and butter all through the summer. Meats and butter are on our tables three times a day, when in reality they ought to be sparingly used during the summer months, at least by the young, the old and the feeble, and by all who are most of the time in doors, or who have no active employment. For the classes just named, a very appropriate diet for the summer would be as follows:

Breakfast—Cold bread and butter, a slice of cold meat, or in its place a couple of eggs, or a saucer of berries or stewed fruit, without milk, cream or sugar. The same for dinner, with one vegetable; no other desert. For supper some cold bread and butter and a cup of hot drink, and nothing else; nothing whatever between meals. So far from starving on such a diet, the class of persons above named would thrive on it, would grow stronger, would have more bodily vigor, more mental elasticity, and a greater flow of animal spirits, and for the reason that few would eat too much; there would be nothing to over-tempt the appetite, hence the stomach would not be over-worked; what work it did perform would be well done; the blood made would be pure, life-giving and energizing. Any man of ordinary intelligence and observation, who will give a fair trial to the above system of feeding, will scarcely fail to be convinced of its value within a week after he begins it.

## How to Cure Stammering.

Lute A Taylor, editor of the *La Crosse*, (Wis.) *Leader*, who has been an inveterate stammerer, writes as follows about the way to cure the habit: "No stammering person ever found any difficulty in singing. The reason of this is that by observing the measure of the music—by keeping time—the organs of speech are kept in such position that enunciation is easy. Apply the same rule to reading or speech, and the same result will follow. Let the stammerer take a sentence, say this one—'Leander swam the Hellepont'—and pronounce it by syllables, scan it, keeping time with his finger if necessary, letting each syllable occupy the same time, thus, Le-an-der-swam—the-Hel-les—pont, and he will not stammer. Let him pronounce slowly at first, then faster but still keeping time, keeping time with words instead of syllables, and he will be surprised to find, that, by very little practice, he will read without stammering, and nearly as rapidly as persons ordinarily talk or read. Then practice this in reading and conversation until the habit is broken up. Perseverance and attention is all that is necessary to perform a perfect cure."

## Beef Tea.

Many persons believe that beef tea is very nourishing, and that it is an excellent strengthener for people of weak health. This is a mistake. Some few practitioners and chemists have long been aware of the fact, and now their view is confirmed by Dr. Marcet. There is no nourishment in beef tea. Mixed with solid food, it imparts a relish which promotes digestion; and the best that can be mixed therewith is the beef from which it was made, reduced to a powder. In two, at least, of the London hospitals the mixture of powdered beef with the beef tea has long been practiced; and there the patients get strong on a beef-tea diet. It is worth remembering, too, that the objections to the use of beef tea apply equally to the preparation described as Extract of Meat, with the further disadvantage that the extract is always stale.—*Chambers' Journal.*

## Notices to Correspondents.

W. H. M. SHERMANTOWN, NEV.—Are there any of Ericsson's original Caloric engines manufactured now, and if so, by whom, and at what prices are they sold? and what "horse power" do they possess? I know of "Roper's Improved," but that is not Ericsson's invention. Parties here are in search of one for use in forch-lust furnaces, where water is scarce, if they have sufficient power for the purpose. I think 5-horse power, and perhaps less, ample for the smelting of lead ores.

[We saw, recently, several of Ericsson's old engines in operation in New York, but no new or improved ones. It is our impression that there are some dozen orders lying useless in this State, which would be sold cheap if advertised for sale.—EDS. PRESS.]

MR. A. D. HODGES, lately connected with the editorial staff of the Press, has taken leave of absence, having been called to occupy a responsible position in one of the mills at Dayton, Nevada. While we regret to lose such an efficient co-worker we are nevertheless pleased to see his services so fully appreciated elsewhere. He has promised to continue his contributions to the Press, from time to time, as his leisure may permit.

IMPORTANT MINING SALE.—MR. E. Ferguson has sold to an English company his mine, located on the main Merced river, about 10 miles below the Yosemite Valley, Mariposa county. The consideration \$100,000, cash down. The mine has paid over \$40,000 net in the last seven months. Thus it seems that despite the counsel of the London Times, English capitalists will still persist in investing their money in California mines. The "Thunderer," seems to be losing its former influence, and is becoming less and less regarded as a safe guide in matters either financial or political.

## A California Improved Road Steamer.

What has become of Hyde's overland steamer? has been asked so often, that we have taken pains to give the public an answer. Every one is familiar with its performances in this city; and of its transfer to Sacramento, and its feat of hauling the three capitol columns 50,000 lbs.—unloading itself from the ears down an incline of 32°, and loading itself up over the same slope when it had performed its work at the capitol. The next we hear of it is from the Corinne Reporter, of June 3d, which remarked: "The steam wagon drew well to-day, it drew a big crowd of spectators;" also, "Early last evening the great steam wagon of the Corinne line to Southern Utah arrived from the west on the freight train. It is a wonder of strength and ingenuity and has already been tried as to capacity for hauling. It is now here awaiting the steamboat to carry it across Great Salt Lake to the roads leading toward the mines. A commencement of the vast enterprise of making steam thoroughfares of all the common roads in Utah. Col. Hyde & W. W. Hanscom, the builder, goes to Salt Lake City, to-day, with this useful wonder, and after showing it to the inhabitants of that place will return and ship it to Lake Point, by the steamboat, City of Corinne."

The Corinne paper, of June 10th, says the steam wagon has arrived from Salt Lake City, where it has been giving practical tests of its powers. It goes to Lake Point from here to haul ores from the mines to the steamboat landing. From the boat it crawled its way to land over the shaly wharf with the same caution that any other elephant would. It was there loaded with lumber and coal, for bridges and fuel on a train of six wagons, one of iron entirely, the others ordinary freight wagons. The progress of the steamer to Tooele and Stockton and its return with a load of ore and hullion are best given from Mr. Hanscom's diary notes taken on the trip.

The greatest difficulty experienced was in the supply of water obtainable on the road, some of which could not be kept in the boiler on account of its effervescing so much. It became necessary to blow out the water several times when they could get better to fill up with. The tanks carried 300 gallons, which will supply 20-horse power four hours, with a consumption of five pounds of coal per horse power per hour.

## Notes of the Trip.

July 11th, 1871—Left Lake Point at 9 o'clock this morning, tanks and bunkers full of water and coal. Drawing:

One iron truck.....	5,000 lbs.
Five wood freight wagons.....	10,000 lbs.
Steamer itself.....	22,000 lbs.
	37,000 lbs.
Lumber and coal to distribute.....	26,000 lbs.
Total.....	63,000 lbs.

Road rough, over rocks—an old stage road. Water foamed very much. Stopped at Grecian Bend for drinking water. From here the grade was 1 in 20; used 85 lbs. steam; road hard. Stopped at Coral for water with 45 lbs. of steam. Water not foaming so bad. Filled tanks and started with 70 lbs. of steam. Coal very bad, making much clinker, stopped for steam at 60 lbs., started with 80 lbs. steam on grade 1 in 30 a distance of 3,860 feet to summit. Stopped to pump up boiler. Started with 50 lbs. steam, but stopped again soon to make more. Arriving at Eave's, 4½ miles, at twenty minutes past three. Terrific wind storm. Filled tanks by barrels; took on ¼ cord of wood and left two tons coal. Stopped at Eave's all night.

Started from here in the morning with full tanks, 100 lbs. steam, grate clean and fuel good; gained steam to 125 lbs. on an up grade of 1 in 100. Arrived at L. J. Smith's, at 7-15 min., with 70 lbs. steam and 16 in. of water in tanks. Left L. J. S.'s at 9.55 with 130 lbs. steam; in 21 minutes stopped for water in boiler, on up grade of 1 in 40, road soft loam, much cut up by teams. Boiler foamed very much when going over the little sharp spitches of the road. Stopped for steam and water in boiler—boiler still foaming. Had to stop and draw fire and clean clinkers off of the grate—clinkers as big as a hat being drawn out. Started again on an up grade of 1 in 16 with 65 lbs. steam and cutting off at ¾ stroke; stopped for water in boiler and lueched. When one quarter of a mile

from Three Mile creek, unhitched from train and run to creek for water, but found it dry. Hyde then walked three miles in to Tooele town got four barrels of water hauled out to the engine. Hitched on and brought train across the creek. Mayor, officers and citizens came out with a band of music to welcome the steam horse. Got three more harrels of water, but unhitched and run to the creek near Tooele for more water; hack and hitched on again taking train about half a mile, when it being near dark, unhitched and ran the engine to the creek on edge of Tooele and stopped for the night getting to the Oquirrh House at half past nine.

Sunday morning, took engine and train round to front of the hotel and all rested this day—Monday—took out lumber for bridge and cleaned out our boiler. Tuesday, 18th, took train with seven barrels of water, 1,000 lbs. coal and left at noon, going by way of Coleman's with 60 lbs. steam. Stopped five minutes to examine the road; started on but soon stopped again five minutes to feel the road, and examine the ditches. In crossing the ditches wheels would sink five and six inches; but finding hard bottom would keep going, went round corners with steam at 60 lbs. drawing the train. Reached last ditch at 10 o'clock. Filled tanks, barrels and boiler and hellies and went ahead again. Run on till we broke through into a drain from a house. Unhitched and hauled out with the wire rope and 120 lbs. steam. Stopped to clear stones from last dry ditch; ran along 20 minutes, stopped to take stones out of the road. Grade averaging 1 in 45. Arrived at turn of road and stopped for water. Started up grade, 1 in 35, with 85 lbs. of steam. Stopped on grade of 1 in 25 to clear road of rocks. Started and run 20 minutes; stopped to throw out stones, again going on 15 minutes, stopped for stones. Tank one-half full. The last mile, before making divide, the grade ranged from 1 in 16 to 1 in 9. Arrived at Stockton at 7½ p. m., amid great excitement. Wednesday 19th left three wagons at hotel to load with one, at baru. Took the iron truck and one wagon to smelters for bullion, loaded truck with 13,000 lbs. and wagon 7,000 lbs. Road out of the cañon hard gravel, but sidding, 1 in 7—on grade 1 in 50.

Broke train to go over the divide. Took truck with 13,000 pounds up the grade 1 in 8 with 110 lbs. steam; road hard and some gravel, cutting off at ¾ stroke; also over grade of 1 in 10, with 90 lbs. of steam, cutting off at ¾. Got wagons all in town at night. July 20th started in morning and hauled wagon with 7,000 lbs. to top of divide; then iron truck with 13,000; then 2 wagons, with 160 sacks of ore; then clipper wagon with 40 sacks. In hauling these loads from Stockton to divide, the load including engine averaged 40,000 lbs. The grade was 1 in 25 and steam 80 lbs., the road dry, dusty, grass ground, no sinking of engine wheels, but wagon wheels sunk some. With gross load of 40,000 lbs., up a grade of 1 in 7 it took 115 lbs. of steam, over a very bad, rough road full of stones, from size of walnuts to hen's eggs, and sidding 1 in 5. Got all wagons to top, made up train and tried it.

Steamer.....	22,000 lbs.	} 7,000 lbs. Rolling Stock.
Iron truck.....	5,000 lbs.	
5 wagons.....	10,000 lbs.	
Bullion.....	20,000 lbs.	
Ore.....	20,000 lbs.	
Water.....	2,000 lbs.	} 43,000 lbs.
Coal.....	1,000 lbs.	
Total.....	80,000 lbs.	

Started the train with 100 lbs. steam; crossed Soldier's Bridge Cañon, taking the whole train up a grade of 1 in 25, in one place 1 in 7, requiring 120 lbs. steam, cutting off at ¾ of stroke. After crossing bridge and one more canon, stopped train for the night. All but Hyde walked back to Stockton for supper. They took his to him as they went back, all slept on train.

Friday, 21st, made an early start, with 100 lbs. steam, up a grade of 1 in 28, cutting off at ¾. Bolt in excentric strap got loose and slipped. Stopped, put in a bolt and moved with 120 lbs. steam on ground soft enough for wheels to sink an inch and up a grade of 1 in 18 cutting off at ¾. Stopped and unhitched to run to Tooele for water. Devil or some other bad spirits in the water that came out of the whisky and vinegar barrels prevented boiler making steam, and had to blow everything entirely out and start fresh.

Saturday, 22d, filled boiler and went out to train in afternoon, brought train to bridge.

Sunday, rested.

Monday, 24th, sawed wood and brought train across hridge to Nelson's and filled up with water; while crossing a bridge the forward iron truck run off the track plank and out through, and every wheel of the

train dropped to the axle, cutting the planks into splinters and making kindling wood for the rest of the trip.

Tuesday 25th, started from Nelson's with train and 10 sacks coal and 1 cord of wood; run back to creek, fixed bridge, filled tanks and harrels, hitched on to train and got to Eave's at 5:40. Coal very bad, being about ¾ shale. Stopped for night.

Wednesday, 26th, left Eave's at 9 o'clock, run down to Lorenzo Youngs for better water, washed engine, and started with train, water foaming very badly, got train to foot of hill and blowed out, went back to Young's again, got all fresh water, and took iron truck to top of hill. Then 2 wagons. Hanscom walked to Clinton, and engine went back again for water. Blowed out and filled up.

Thursday, 27th, finished hauling the water and put in 12 sacks coal, got steam and left Eave's at 1:30 p. m., taking the last 3 wagons to top of hill. Made up train and started at 2:20, arriving at Grecian Bend at 6 o'clock. Unhitched and went to trading store. After filling tanks and boiler, went to Clinton's and stopped for night.

Friday, 28th, started at 9:30 A. M. getting into Lake Point at 11 A. M., leaving bullion wagons at stable and ore wagons at Steamboat Mill.

Thus was run the first freight train ever drawn in America, by steam, over a new, rough country road; and Messrs. Hyde & Son have received the first freight money ever earned by such means. Though the difficulties particularly as to water seemed almost insurmountable, yet with a pluck that was astonishing to the slow apprehensions of the Utahites, Messrs. Hyde & Hanscom overcame every difficulty, and brought the train in that showed immense capabilities in the machine. When we survey, by the aid of these diary notes, the ground it went over, and the load it hauled—40,000 pounds of ore and bullion, and 37,000 lbs. of rolling stock in engine and wagons, with an average of 3,000 of fuel and water, making a load of 80,000 lbs. moved twenty miles, the engine running back and forward for water, making about 60 miles running.

The road over which this work was done consists mostly of loam, which has a road resistance of 150 to 250 lbs. per ton, with three places where the resistance ran as low as 100 lbs. per ton, the road being hard sand. The grades varied from 1 in 100 to 1 in 7—the most about 1 in 50; and in some places there were pitches about seventy-five to one hundred and twenty-five feet across, from eight to twelve feet deep, some of them containing many rocks projecting above the ground from one to two inches. Some of the steepest grades were sidding from 1 in 5 to 1 in 12, throwing immense strain on the wheels and rubber tires, and showing the powerful traction those wheels have. Total amount of water used from Stockton to Lake Point, (20 miles) was 1,500 gallons and about 3,000 lbs. of coal. The resistance of the road averaged about 6,000 lbs.

The engine is rated at 20 indicated horse power; but is capable of exerting, for a short time, much more than that as indicated by the statement of gross loads over various grades, with the resistance given to gravity and road resistance, at an average speed of 1½ miles per hour.

Table of the resistance at circumference of driving wheels, for

63,000 lbs.	grade	1 in 16.	resistance	6,401
40,000 lbs.	"	1 in 8.	"	6,840
40,000 lbs.	"	1 in 7.	"	7,720
80,000 lbs.	"	1 in 18.	"	11,760

The engine has stood the rough work of the road—traveling in all about 60 miles—to the satisfaction of owners and builders, and they consider that the trip has demonstrated that, mechanically, steam on common roads has been made a success. This showing compares most favorably with the recent trials of road engines in England, at the Wolverhampton agricultural show, lately published in the Engineer, particularly in the tractive power of the wheels. No power that the engine has exerted has been able to slip the wheels, and several times the whole pull would be suspended on the point of a rock.

The work has demonstrated the efficiency and superiority of the kind of rubber tire employed by Mr. Hyde over every other yet introduced, the rubbers showing in their action, as was anticipated, a regular, continuous change of surface as they were pressed to and left the ground, creeping around in their beds by every pressure, thus presenting a new surface to the wear at every revolution of the wheel, and keeping a perfectly true roller. There appears to have been fewer weak points developed in this machine than in any other we have been informed of; and those who are interested should compare the perform-

ance of this engine with the recent trials of road engines at Barnhurst and from Wolverhampton to Stafford in England, as published in the *Engineer*, which will show that with all their experience they are not one whit ahead of the now State of California in overland or road steamers.

#### Recapitulation.

To move the total weight of 80,000 lbs., engine cutting off at  $2\frac{1}{2}$  and road grade 1 in 25, required 120 lbs. steam; with the grade 1 in 28, hard and smooth, required 100 lbs. steam; with grade 1 in 18, on loamy road, so that train wheels would cut in three-quarters to an inch deep required 120 lbs.

On a level, hard, smooth road 60 lbs. steam would start the load, and 45 lbs. would then keep it moving. On a down grade of 1 in 22, the gravity of the load would move the whole train without steam. The actual running time on the road for the first  $4\frac{1}{2}$  miles was 3 hours 15 minutes; to next station,  $2\frac{1}{2}$  miles, 1 hour and 30 minutes actual pulling time. From thence to Tooele,  $6\frac{1}{2}$  miles, though they did not get there till night, yet the real working time was but 3 hours 49 minutes. From Tooele to Stockton,  $6\frac{1}{2}$  miles, the working time was 2 hours 25 minutes. Total, 10 hours 59 minutes.

On the return trip, the working time was from Stockton to Eave's, 13 miles, 8 hours and 10 minutes, and from Eave's to Lake Point, 3 hours and 20 minutes. Total hauling time, 11 hours 30 minutes.

#### English Capital and California Mines.

We have before alluded to the conduct of the *London Times* in working against the investment of capital in the mines of this country. The *Times* has been answered fully by Ross Browne, and now the matter has been taken up by other English journals who all differ from the *Times*.

That paper is willing to allow that there may be one or two mining properties worth purchasing here, and has actually spoken favorably of one scheme,—perhaps more. But in this case its opinion is precisely as valuable as in the others. Knowing nothing of the subject, and continually making rash statements, what it says one way or the other is not to be depended on.

In the columns of the *Times*, the assertion has been made, for instance, that the mines sold in London during the past year or two, have been purchased merely on the representation of the vendors and agents. This is a remarkable statement. If it were true, it would be a most serious reflection on the want of common sense among the moneyed business men of England. It would not be the slightest argument against our mining properties, but would reflect solely on Englishmen. But it is too absurd.

Mr. H. H. Roach writes to the *London Mining Journal* concerning this statement, and what he says is worth noting.

"You will, I hope, assist me to distinctly deny this gross mistatement, which impugnes the conduct of all the agents, directors, stockbrokers, and others now operating in this branch of business.

"I defy the said writer to name one mine that has been sold in this market without first having been inspected by an *English* mining engineer, selected by the purchasers, and sent out from here to verify all statements. The result of the last ten years' business in London is about as follows:—Over one million sterling has been invested in developed and dividend-paying American mines (not "wild cats.") The result has been more than satisfactory. Most of the properties pay regular quarterly dividends, and the gross subscribed capital has nearly doubled in value.

"Having acted as agent for the sale of several of these properties, I am anxious as the press to stamp out everything that is "Bogus," and endeavor to maintain the high character that American mines now hold in this market."

The *Mining Journal*, *Mining World* and other English papers which are posted in the matter have thoroughly exposed the ignorance, willfulness and prejudice of the once powerful "Thunderer."

#### Crocker's Trip Hammer Quartz Mill.

Each successive Fair brings out one or more devices for crushing quartz. At the present exhibition Mr. C. D. Crocker, of Virginia City, Nevada, exhibits something quite different from anything which has heretofore been seen. A large working model is shown, of dimensions quite large enough to do considerable effective work.

We give, herewith, a very accurate representation of this noisy little worker, the loud clattering of which draws crowds around it whenever it is put in motion. It is constructed upon the principle of the trip hammer, whereby quick, sharp blows are made, with very light stamps, and with less proportionate power, according to weight of stamp and frequency of blows, than is required in operating heavy stamps with a direct lifting action. The model on exhibition appears to work well, and if the principle will work equally well on a large scale, there will undoubtedly be a material advantage in this over the ordinary plan of operating stamps.

The advantage of sharp, quick blows with a light stamp, must be obvious to

rapidly increasing in both sales and popularity. The illustrations recently published in this journal showed a portion of their superior points of principle and construction.

Mr. Carnahan has been associated with the company for six years. He informs us that over four hundred men are now employed in the works. These safes and locks are used by a majority of the leading banks in Cincinnati, Pittsburgh, Chicago, St. Louis, Louisville, Memphis, New Orleans and various other southern and western cities. The largest orders filled the past year were for a bank vault, etc., in Pittsburgh, for \$40,000, and another in New Orleans for \$50,000.

#### The Mechanics' Fair.

The arrangements of exhibits at the Pavilion were perfected early in the week, and the exhibition is now complete. Every available foot of space is occupied, and the exhibition, as a whole, is universally pronounced superior to any which has preceded it. More taste is displayed both in the general decorations by the manage-

CROCKER'S TRIP-HAMMER QUARTZ MILL.

every one who has employed alternately a small light hammer, and a heavy one for breaking quartz before a battery. The inventor claims a decided advantage in his 400 light blows per minute over the 50 to 60 blows per minute delivered by the usual 600-pound stamp.

A 5-stamp battery of this construction strikes 2,000 blows per minute; and while the first cost is greatly reduced in attaining the same crushing capacity, the power required to run it is also much reduced. The difference in freight to many places would also be very great. The machine is made of different sizes, and calculated to crush from seven to thirty-five tons per twenty-four hours. The construction and mode of operating the machine will be seen at a glance by reference to the illustration. As a prospecting machine nothing could be better; and we trust the inventor will soon give it a practical trial on a large scale.

#### Hall Safe and Lock Company.

The largest safe manufacturing company in the world, located in Cincinnati, is about to establish an agency in San Francisco.

We allude to the Hall Safe and Lock Co., whose general agent, Mr. J. R. Carnahan, is now in our city, and will make his headquarters at the well and favorably known hardware house of Conroy & O'Connor, Front street, until Sept. 1st.

A few months since our special agent visited the works of this company, in Cincinnati, and furnished us the most positive assurance that its manufactures—including Hall's patent dovetailed burglar-proof safes, patent concrete fire-proof safes and his patent celebrated combination bank locks—are of the highest rank and are

ment, and by the exhibitors in their individual arrangements. Some idea of the former may be realized from the fact that about two tons weight of flags alone are employed—of course those of all nations are shown, and generally in great profusion. The large fountain is materially improved, and a smaller one has been placed in the Horticultural Department from which jets and sprays of cologne are constantly playing, and adding their delicious fragrance to the perfume of numerous flowers elegantly arranged in beds and parterres, divided by avenues and walks, and relieved by statuary, arbors and various other ornamental devices. The fountain is operated by machinery, of course,—one of Knowles' patent hose pumps being employed, and connected with the driving power of the main engine. The attendance both day and evening is very large, and the receipts in proportion.

#### The Art Gallery

Is well filled, and the display of paintings, statuary, photographs, drawings, etc., is very fine. But the chief attraction at that end of the Pavilion appears to be the remarkable and unique exhibition of

#### Japanese Products.

Four weeks were occupied in the arrangement of this department. The weight of goods, as per ship's manifest was 66 tons, embracing almost every variety of articles manufactured in the Orient.

The Japanese goods have been collected, forwarded and put up under the direction of Mr. H. D. Dunn, who was sent out as a special agent by the Institute. Several Japanese, who speak our language quite well, accompanied the goods, and are in constant attendance in that department, and add interest to this curious exhibit by their readiness to answer questions with

regard to the articles, propounded by visitors. This display is by far the largest of Japanese goods ever before made outside of that kingdom.

#### Chinese Products.

In the same room are several large cases of China goods, fancy articles, etc. This exhibit has been collected and forwarded through the personal exertions of Dr. D. J. McGowan, of Shanghai, China, a gentleman well known to many of our citizens, and who spent several months here some three or four years ago, and lectured on "China and Japan." One case of goods in this collection is chiefly made up of a fine assortment of elegant Chinese silks of all colors, and much heavier than similar goods manufactured in Europe. There is also a varied assortment of ornaments, many of exquisite workmanship, taste and art.

Many of the articles from China and Japan are superior to any which have ever before been allowed to leave those countries. Those forwarded by Dr. McGowan, and which were consigned to N. D. Arnot, Esq., will be sold at the close of the Exhibition, and we presume some of our wealthy citizens have already got their eyes upon choice sets of ware, rich dresses for their wives, rich cabinet work or some other rare specimens of oriental skill and industry.

#### The Mechanical Exhibit

Is not so full as we have seen it in the past, but it is good and suggestive of progress, nevertheless.

HALLIDIE'S TRAMWAY, is one of the novelties in this line, and crowds of curious visitors are attracted to witness its workings. One of these tramways is now in operation at White Pine, conveying ore several miles from the mine to the mill where it is crushed.

THE PACIFIC ROLLING MILLS make a fine display and give evidence of progress in a most important branch of industry.

ROCK DRILL.—Dr. A. Blatchly is there with his improved Rock Drill. He has improvised a tunnel in which he exhibits the mode of working his drill in a confined space, and shows a curious and ingenious device for carrying power around a corner, without the use of intervening pulleys or gearing.

HAMMER QUARTZ MILL.—Mr. C. D. Crocker exhibits a large working model of a trip-hammer quartz mill which is elsewhere more fully described and illustrated.

SPAULDING & Co. have a tasteful arrangement of saws from their manufactory. The American Flag, with escutcheons and a huge eagle is faithfully represented by a curious arrangement of saws—circular, cross-cut, hand, ice, pruning and various other kinds.

A HUGE MINING PUMP of a capacity of 60,000 gallons per hour, of somewhat novel construction is exhibited by Borry & Place. They also exhibit an endless band saw, several blowers and various other machines for diverse purposes.

DAVID STODDART exhibits a series of Cameron Steam Pumps, of various sizes from 0 to 8, the largest of which has a capacity of 2,400 gallons per minute. All these pump are of heavy make being intended for heavy as well as light duty.

NELSON & DOBLE are on hand with a general assortment of horse shoers, tools, miner's drilling sledges, hammers of various kinds, sledges, chisels, etc. They also show two ingots of steel, the first manufactured on this coast. One-half of each ingot is drawn out to show the quality of the steel.

DEACON & Co., Machinists, at 120 Main street, exhibit a stationary engine, built for the California Jewelry Company, who are now erecting a large iron front building on Sutter street between Montgomery and Kearny. We learn also that the same

(Continued on page 108.)

## DOMESTIC ECONOMY.

### Hints in Canning Fruit.

The season for canning fruit is now at its height and every housekeeper should put up a good supply for use after fresh fruit has gone. There is nothing healthier or hardly anything cheaper than canned fruit—really worth nothing where you raise it yourself. The best fruit is that which contains the least sugar—even down to none at all.

It may seem almost superfluous to write anything upon this subject—so generally is canning practiced, and so adept do most people think they are at the business; but one Estelle Edgerton has written a letter to the *American Agriculturist*, which we think contains some hints that will be new at least to some of our readers. We copy as follows:

A lady not long since was telling me that last fall she put up three baskets of as handsome peaches as were ever gathered, and every hottle was spoiled. I constantly hear the ladies talking about their spoiled fruit. There is another remark I often hear, and which seems absurd to me. It is this: "My fruit always white molds, and I think improves it." There is a thick leathery white mold, which often forms on the top of the fruit, and which can be removed whole without affecting, apparently, the flavor of the fruit; but it is not desirable to have even this sort of mold. It would be out of the question to send such bottles to a long distance, as the mold would be spread all over the fruit, if it did not impart any unpleasant flavor. There is such a thing as having hotted fruit without any mold whatever. I think the reason white mold forms, is, that the lid of the can is not applied soon enough, and many ladies consider this as part of the process. Only yesterday a friend told me that she always waited three or four minutes after the fruit was in the hottle before putting on the lid. "It lets out the air," she said. I looked surprised. "You know there are always bubbles of air that have to come up." "Oh, yes!" "I know but I always run a knife quickly down the inside, and that brings them up." The quicker the lid is applied, the better, and it should not be disturbed until you want to use the fruit.

In regard to the air-bubbles, which often form while the bottle is filling, a little care will obviate the difficulty. In putting the fruit into the bottle, do not pour in such a way as to close the whole mouth of the bottle, because that prevents the escape of the air; but rather let the fruit slide gently down the side of the bottle. It can be done just as quickly this way as the other.

The secret of having hotted fruit keep, is to have a perfectly air-tight cover, and to be sure that the fruit perfectly boils all throughout, before putting it into the bottles, and then to be quick about putting on the cover, and letting the cover alone until you want to use the contents of the bottle.

It is not necessary to let out the steam or air, after the cover is on. Do not place a string under the rubber for this purpose. Do not insert a pen-knife under the rubber (according to some directions) to let out air (I know a lady that learned this lesson after her peaches had all fermented). It is not necessary to bury bottles in the earth, or to have a dark vault made in the cellar for the purpose. Mine keep perfectly, without mold, on a shelf in a rather light cellar. If you bottle your fruit in the right way, it will keep almost anywhere, but by the stove; if you don't do it right, and let in the air with a knife, or some other way, it won't keep, no matter where you put it. Of course, if you have not done it right it will keep longer in a dark, cold place, but it will succumb to the atmosphere in the end. Bottled fruit put up in a proper manner will keep for years if desired. I had some splendid peaches at a friend's the other evening, and she said she did not know whether they were two or three years old. But she knew they were not last year's, for she did not put up any, as she had used all her empty bottles for cherries, plums, raspberries, etc., and she had several bottles of peaches on hand, and she did not think it necessary to buy more bottles for a fresh supply.

### Arrangement of Rooms.

Give your apartments expression—character. Rooms which mean nothing are cheerless, indeed. Study light and shade, and the combination and arrangement of drapery, furniture and pictures. Allow nothing to look isolated, but let everything present an air of sociability. Observe a room immediately after a number of people have left it, and then as you arrange the furniture, disturb as little as possible the relative position of chairs, ottomans and sofas. Place two or three chairs in a conversational attitude in some cheery corner, an ottoman within easy distance of a sofa, a chair near your stand of stereoscopic views or engravings, and one where a good light will fall on the book which you may reach from the table near. Make little studies of effect which shall repay the more than usual observer, and do not leave it possible for one to make the criticism which applies to so many homes, even of wealth and elegance—"Fine carpets, handsome furniture, a few pictures, and elegant nothings—but how dreary!" The chilling atmosphere is felt at once, and we cannot divest ourselves of the idea that we must maintain a stiff and severe demeanor to accord with the spirit of the place. Make your homes, then, so cosy and cheerful, that, if we visit you, we may be joyous and unconstrained, and not feel ourselves out of harmony with our surroundings.—*Art Review.*

ALMONDS possess one very important quality which is not generally known. By pounding and mixing with water, and straining, a beverage almost precisely similar to the sweetest and richest (cow's) milk may be obtained. Cream even separates from this milk, which may be converted into butter; so it is said. Thus almond orchards might afford us a supply of milk. Rees' Cyclopaedia, in a recipe for preparing milk of almonds, gives the proportions to be used as one ounce of almonds to one quart of water. In nutritious properties it is said by chemists to be fully equal to cow's milk, and has fine medicinal qualities, being a valuable remedy for heart burn, acidity, etc. We should like to receive for publication the actual experience in this use of the almond. Will some one who has the fruit, experiment and report?

HOW TO BLEACH COTTON CLOTH.—It may sometimes become necessary or convenient to bleach a piece of cotton cloth, although as a general thing it is better to obtain white cloths already bleached. Home-bleaching, moreover, is apt to injure the fabric more than the process in use at the factories, especially when manipulated, as it always is there, by skilled hands. However, cloth may be bleached as follows:

To five pounds of cloth take twelve ounces of chloride of lime. Dissolve the lime in a small quantity of boiling water; when cold, strain it into a sufficient quantity of water to cover the cloth. This must first be boiled fifteen minutes in strong soapsuds, and rinsed well in clear water. Then put it in the lime-water from ten to twenty minutes, airing it well by lifting up and down. Rinse thoroughly in warm or cold water.

HOME MADE CHLORIDE OF LIME.—An excellent disinfectant is readily obtained by dissolving a hushel of salt in a barrel of water, and with the salt water slack a harrel of lime, which should be wet enough to form a kind of paste. For the purpose of a disinfectant, this home-made chloride of lime is nearly as good as that purchased at the shops and drug stores.

ALL salted provisions should be watched to see that they are kept under the brine; for if one piece of meat lies up it will spoil the whole harrel. If the brine looks bloody, it must be scalded and more salt added; when cold, pour back.

BETTER THAN SODA.—A German scientific journal recommends laundresses to use hyposulphide of soda in place of common washing soda. It does not attack the fabric in any way, and at the same time exerts some bleaching action, which greatly improves the appearance of linen calicoes.

### Domestic Receipts.

VELVET BISCUIT.—In the milk and two well-heaten eggs put the yeast, soft butter and salt. Stir into it sufficient flour to make soft dough; strew some flour over it; lay a warm towel over the pan, and set it in a warm place to rise. Dip your hands in flour, and work the dough down; make it into small flat cakes; lay them on a buttered tin pan, quite near each other, and bake them in a quick oven for fifteen minutes, or until done.

SPONGE FLOUR BISCUIT.—Sift the flour and salt into a pan; heat the milk and lard together; pour the yeast and milk into the flour; make a stiff dough when risen; grease a pan; drop the latter on in large tablespoonsful; let them set where they will be merely warm (no more), then bake in a quick oven; eat at once. They may be baked in cups.

TO MAKE A SHORT CRUST.—Put six ounces of butter to eight ounces of flour, and work them well together; then mix it up with as little water as possible, so as to have it a stiffish paste; then roll it out thin for use.

PASTE FOR FRUIT TARTS.—Put a pound of flour on your pastry slab, with six ounces of butter, and rub them well together with your hands, then make a hole in the center, in which put two ounces of powdered sugar, two whole eggs, and rather more than a wineglass of water; mix the eggs, water and butter, shaking the whole well together, and when dry, work it together lightly, with the hands.

ANOTHER WAY.—Put an ounce of loaf sugar, beat and sifted, to one pound of fine flour. Make it into a stiff paste, with a gill of boiling cream, and three ounces of butter. Work it well, and roll it very thin.

PUT UP TOMATOES as follows: One peck of tomatoes, skinned; one and a half pints of vinegar; four pounds of sugar; one tablespoonful of cloves and one of allspice. Put in stone pots and cover tight.

CORN FRITTERS.—Beat two eggs, and add to them one pint of grated green corn, and as much wheat flour as will make it adhere together. Dip the mixture out with a tablespoon, and fry in small cakes in hot lard.

### Mechanical Hints.

GREEN VARNISH.—There is a most beautiful transparent green varnish employed to give a fine glittering color to gilt or other decorated works. As the preparation of this varnish is very little known, an account of it may in all probability prove of interest to many of our readers. The process is as follows: Grind a small quantity of a peculiar pigment, called "Chinese blue," along with about double the quantity of finely powdered chromate of potash, and a sufficient quantity of copal varnish thinned with turpentine. The mixture requires the most elaborate grinding or incorporating of its ingredients, otherwise it will not be transparent, and therefore useless for the purpose for which it is intended.

The "tone" of the color may be varied by an alteration in the proportion of the ingredients:—A preponderance of chromate of potash causes a yellowish shade in the green, as might have been expected, and *vice versa* with the blue under the same circumstances. This colored varnish will produce a very striking effect in japanned goods, paper-hangings, etc., and can be made at a very cheap rate.—*Cabinetmaker.*

HINTS TO BUILDERS.—One of the worst mistakes architects make in constructing houses is the narrow stairways in the rear. For instance, one almost invariably finds the stairway leading from kitchen to cellar or laundry only wide enough for one person. If there is any part of a house that should have a broad easy stairway, it is that part which is used the most, and where it is necessary daily to carry bulky materials up and down. It is good economy to have a wide stairway all through a house. In nearly all of our high-stoop city houses there is no water or wash-basin on the main floor, and there is no reason for this defect but the inconceivable stupidity of architects. If an architect can find no other place for a wash basin, let him locate it in a niche in the hall—anywhere, so that he saves the family from the miles and miles of unnecessary fatiguing stair-travel which they otherwise must suffer.—*American Builder.*

RICE BEER.—The brewers in Germany have got to making beer from rice. It is very clear, pale in color and has a pleasant, mild taste, foaming strongly and retaining its carbonic acid.

The woman that maketh a good pudding in silence is better than one that maketh a tart reply.

## LIFE THOUGHTS.

NOTHING is really troublesome that we do willingly.

The world is only saved by the breath of the school-children.

Love is the spark that burns up the mountains of iniquity.

A BEAUTIFUL external life symbolizes a beautiful internal life.

GAIN one clear distinct truth, and it becomes a centre of light.

LEARNING bath gained most by those hooks by which the printers have lost.

THE virtue which requires to be over guarded is scarcely worth the sentinel.

A KIND speech and forgiveness are better than alms, which harm or reproach followeth.

ONLY profound stupidity can always, despite every shock, keep up a belief in its own infallibility.

GREAT efforts from great motives are the best definition of a happy life. The easiest labor is a burden to him who has no motives for performing it.

As in the silence of the night the ear catches the least sound, so, in the solitude of reflection, the mind detects soft and delicate strains of thought, unheard in the bustle of the crowd.

ENJOY the blessings of day, and the evils bear patiently and sweetly, for this day only is ours; we are dead to yesterday, and are not born to the morrow.

WEIGH every step that you are about to take, whenever passions become involved. How often do things assume a different aspect when they are fairly considered.

### The Voyage of Life.

Life hears us on, like the stream of a mighty river. Our boat first glides down the mighty channel—through the playful murmurings of the little brook and the windings of its grassy borders. The trees shed their blossoms; the flowers seem to offer themselves to the young hands; we are happy in hope, and grasp eagerly at the beauties around us, but the stream hurries on, and still our hands are empty. Our course in youth and manhood is along a deeper and wider flood, among objects more striking and magnificent. We are animated at the moving pictures, and enjoyment and industry all around us; we are excited at some short lived disappointment. The stream hears us on, and our griefs are alike left behind. We may be shipwrecked, but we cannot be delayed; whether rough or smooth, the river hastens on till the roar of the ocean is in our ears, the tossing of the waves is beneath our feet, the floods are lifted up around us, and we take our leave of earth and its inhabitants, until of our future voyage there is no witness save the Infinite and Eternal. *Bishop Heber.*

LAUGHTER.—Nothing act so directly on the organs within, both chest and abdomen. Ten hearty laughs, real shonts, will do more to advance the general health and vitality than an hour spent in the best attitudes and motions, if in a sober, solemn spirit. Of course we know you can't laugh at your will, so you must play with your little children, introduce a hundred games which involve competition and fun. Open the folding doors, move back the center table, and go at it. Play with the dog, run for the pins, play any of the games which you can recall from early experience.

A WORD.—Say not a word you had better leave unsaid. A word is a little thing, we know, but it has stirred up a world of strife. Suppressing a word saved many a character—many a life. A word unuttered, and Hamilton would have lived, a pride of his country. Who can tell the good or bad effect of a single word? Be careful what you say.

KIND WORDS are the bright flowers of earth's existence; they make a very paradise of the humblest home the world can show. Use them, and especially around the fireside circle. They are jewels beyond price, and more precious to heal the wounded heart, and make the weighed-down spirit glad, than all other blessings the earth can give.

"I LOVE the man who can smile in trouble, that can gather strength from distress, and grow brave by reflection. It is the business of little minds to shrink; but he whose heart is firm, and whose conscience approves his conduct, will pursue his principles to the death."—*Thomas Paine.*

BETTS'S CAPSULE PATENTS.  
To prevent INFRINGEMENTS, NOTICE IS HEREBY  
GIVEN, THAT BETTS'S NAME IS ON EVERY CAPSULE  
he makes for the principal merchants in England and  
France, thus enabling vendor, purchaser, and consumer,  
not only to identify the genuineness of the Capsule, but  
likewise the contents of the vessel to which it is applied.  
The Lord Chancellor, in his judgment, said that the Cap-  
sules are not used merely for the purpose of the ornament  
but that they are serviceable in protecting the wine from  
injury, and insuring its genuineness.  
MANUFACTURERS—J. WHARF ROAD, CITY ROAD,  
LONDON, AND BORDEAUX, FRANCE.

Claims for our Safes and Locks are:

- 1st—They have never been Destroyed by Fire.
- 2d—They have never been Robbed by Burglars.
- 3d—They are Fire, Damp and Burglar Proof.
- 4th—They are Superior in Finish to any Safe made.
- 5th—Our Seven varieties of Combination Locks sur-  
pass any Locks made in point of Finish, Security and  
Simplicity.
- 6th—Our Locks have stood a Nine Days' Trial by ex-  
perts without being opened.
- 7th—We will put from \$1,000 to \$10,000 behind them.
- 8th—Our Safes and Locks have ALWAYS taken the  
Gold Medals at all Expositions.
- 9th—Our Safes combine some 26 Patent Improve-  
ments, and consequently possess Superior Advantages,  
in point of Security, to any Safe made.

AN INSPECTION WILL PROVE  
the above assertions.

UNION PACIFIC RAILROAD.

Running from Ogden, Utah, to Omaha, Nebraska—over  
one thousand miles. Making

DIRECT CONNECTIONS

AT OGDEN with the CENTRAL PACIFIC R. R. (from San  
Francisco); also with the Utah Central R. R. to Salt Lake  
City.  
AT CHEYENNE with the DENVER PACIFIC R. R., with  
connection at Denver City with the Kansas Pacific R. R. to  
St. Louis and Southern and Atlantic Cities.  
AT OMAHA, for Chicago, Eastern and other cities, with  
the Chicago and Northwestern; Chicago, Rock Island and  
Pacific; Burlington and Missouri River; St. Joseph and  
Council Bluffs Railroads.

EXPRESS TRAINS RUN DAILY.—The U. P. R. R. use  
the Westinghouse patent air brake; Miller's patent truss  
platform and elastic car-coupler; and the most approved  
construction of cars for the comfort and safety of passen-  
gers.

PULLMAN'S MOST MAGNIFICENT SILVER PALACE  
Sleeping Cars attached to express trains.

T. L. KIMBALL,  
General Passenger Agent, Omaha.

[Continued from page 105.]

machine shop has recently built a number of small propeller engines which are highly recommended for simplicity, compactness and durability. Two of these are to be seen on board of the steamer Coquette at the foot of Third street.

**PORTABLE SAWING MACHINE.**—Mr. Johnson comes from Tuolumne county with a sort of perambulating shop, which comprises a portable sawing machine, combined with hand cart, tool chest and saw mill.

**THE RISDON IRON WORKS** exhibit a powerful steam winch for dock purposes—a splendid piece of machinery of their own manufacture.

**THE ENGINES** employed to drive the machinery in the Pavilion are from the Pacific Iron Works, and are perfect models of neat and substantial workmanship.

#### The Agricultural Department

Is not as full as it might be, yet a very creditable exhibit is made, and of much that is novel.

**A NEW BROAD CAST SEEDER** is exhibited by Mr. W. H. Pope, which is illustrated and described at length on our first page.

**DRAIN AND SUBSOIL IRRIGATION PIPE.**—The Pacific Pottery Company of Sacramento make a very fine exhibit, one of the most interesting features of which is their Drain and Subsoil Irrigation Pipes. These pipes are made of a porous kind of clay in sections of about 20 inches in length, and from 3 to 7 and 8 inches in diameter. Trenches are dug in the adobe ground about fourteen inches deep, and fifteen feet apart, and the pipes are laid in them. All the sections are disjointed and loose gravel is put in where the section ends should touch. The trenches are then filled and the water being turned into the pipes is forced through the pores of the clay and through the gravel between the pipe sections. It is found that this system thoroughly moistens the hardest adobe soil and keeps it wet. The vitrified iron stone drainage pipes manufactured by the company will bear a pressure of 110 pounds to the square inch.

**MR. PERKINS**, the well known seed grower and universal seed distributor exhibits some very fine specimens of yellow and white Silicia sugar beets, grown on Sherman Island. Six of the specimens are from crops grown on the levee. The product yields under analysis, 16 per cent. saccharine substance, which is extraordinary. In addition to the beets, Mr. Perkins exhibits 144 varieties of seeds, and samples of Sherman Island barley, which yielded 90 bushels to the acre, and oats which yielded at the thresher 110 bushels to the acre.

**"THE CALIFORNIA GOLDEN FLEECE,"** is the title given a wool exhibit by Jas. Hartley & Co., No. 41 Clay street. It is a single fleece, weighing 26 pounds, supposed to have been taken from a Merino sheep, nearly pure bred, and the staple averaging ten inches in length. This very extraordinary fleece, worth about its weight in silver, was found in a consignment to Messrs. Hartley & Co., from the northern part of the State, and had passed through several hands before it was finally packed for this city.

Messrs. Hartley & Co., are very anxious to find the remarkable sheep which produced this fleece, or its owner. If this paragraph should meet the eye of the latter, he is requested to put in an appearance at the Pavilion, where honors await him.

**AN ECCALEONION.**—Is one of the most interesting novelties on exhibition in this department. The whole process of egg hatching without the aid of the hen may here be seen. The proprietor will have a brood of chickens out in a few days. This is one of the most approved devices of the kind which has ever been invented. We shall probably be able to give an illustration of the same at an early day.

#### The Wilson Steam Stamp Mill.

The late fire at the Mechanics' mill in this city destroyed the Wilson steam stamp mill intended for exhibition at the Mechanics' Institute Fair. This is to be regretted, inasmuch as many were desirous of witnessing the operation of the mill with the view of verifying or otherwise the statement that it is superior to the ordinary cam mill in durability and cheapness. One of these mills has been in successful operation in Indian District, San Diego Co., for the past 14 months, and during that time, to the personal knowledge of the writer, no repairs have been necessary.

The principle on which this mill operates is that of the direct application of steam to the stamp—the stem acting as a piston. The best results have been obtained with 70 lbs. of steam and 206 drops per minute for each stamp. The average amount of ore which can be crushed in a day (of 24 hours) 23 tons with a No. 6 slot screw and the average consumption of fuel is about one cord of wood to ten tons of ore. As instances of its capacity we may cite the fact that some time since, ten tons and eight hundred pounds of rock was crushed in eight hours and forty-five minutes using only one cord of oak wood. Again in one run fifty-one tons were crushed in forty-seven hours, and 10,800 lbs. in four hours fifty minutes with sixty-eight pounds of steam. Mr. Wilson and many others are naturally much disappointed that, for the reason above mentioned, the mill cannot be on exhibition.

**PATENT BRAKE APPLIED.**—The C. P. R. Co. have attached the Westinghouse air brake to the cars on the local trains on the S. F. & Oakland route. The trains are thus stopped with ease and quickness. A new locomotive, having the compressing apparatus, is run.

**VISITORS AND EXHIBITORS** at the Mechanics' Industrial and Horticultural Fair, in this city, are invited to call and subscribe for the PRESS. We shall give interesting and impartial reports, worth reading and preserving.

**GOOD PAPER.**—Latterly we have been obliged to use printing paper from this market, the regular supply of paper shipped by ourselves from the East having become prematurely exhausted by the rapid increase of the circulation of the PRESS. We are now using our own fine paper again.

**SAN DIEGO SPECIMENS.**—L. B. Hopkins of Julian City, San Diego, has sent to the Mechanics' Fair, a large piece of gold bearing quartz, weighing sixty pounds from the Banner District, as a specimen of the average ore taken out of their mines. It is a fine specimen showing visible the free gold throughout. It is now on exhibition, and all interested in the mines of that portion of the country will examine it closely. It is not bad to look at by anybody.

#### New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

**ERIE MINING CO.**—Capital Stock, \$1,000,000 in 10,000 shares. Trustees: W. B. Bourne, G. D. Roberts, J. W. Gashwiler, S. Heydenfeldt and Maurice Dore.

**PACIFIC GLUE MANUFACTURING CO.**—Capital Stock, \$60,000 in 600 shares. Trustees: W. B. Coddington, G. S. Dana, B. P. Batchelder, J. H. Pitts and F. H. Mills.

**Trade Mark Patents for Merchants and Manufacturers**

Can now be secured to advantage under the NEW LAW

In the United States. Parties interested will be furnished with all information desired, and have their application intelligently prepared and promptly forwarded to the Patent Office, and their patents secured in good time, by DEWEY & CO., U. S. and Foreign Patent Agents, No. 414 Clay street, S. F.

#### Premium for New Subscriptions.

There are many persons not familiar with the value of the Press who would ever after be thankful to our present subscribers for bringing their names on to our list of intelligent readers. Large additions can be made with little effort by the many in this way. We therefore offer (post paid) a premium of one of the patent newspaper file holders (advertised in this paper) for every two new subscriptions received with \$8 advanced payment.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

**MARAVILLA COCOA.**—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Coconas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopathic and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. 1c25-ly

**AN ARTICLE OF TRUE MERIT.**—"Brown's BRONCHIAL Troches" are the most popular article in this country or Europe for Throat Diseases and Coughs, and this popularity is based upon real merit, which cannot be said of many other preparations in the market which are really but weak imitations of the genuine Troches.

**A FLORECE SEWING MACHINE**, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at John I. Tay's, Broadway, Oakland. apl-hp-ff

**\$5 to \$20 PER DAY AND NO RISK.**—Do you want a situation as salesman at or near home to introduce our new 4-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 16 Dearborn street, Chicago, Ill. 23yl-12mbp

**LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING MACHINE** against easy monthly installments may apply to No. 294 Bowers, 167 E. 26th, 47 9th Ave., New York Good work at high prices if desired. 21vl-12mbp

**CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.**

**Miners' Foundry and Machine Works,**  
CO-OPERATIVE,  
First Street, bet. Howard and Folsom, SAN FRANCISCO.

**Machinery and Castings of all kinds.**  
7v23ff I. L. MORTHEAP, President.

**Opera Glasses, Pebble Spectacles, and Eyeglasses, in great variety, wholesale and retail. C. MULLER, Optician, 205 Montgomery street, Russ Block, San Francisco.** 7v23-3m

First Premiums awarded by American Institute, N. Y.

**MICROSCOPES.**  
Illustrated Price List sent free.  
**Magic Lanterns and Stereoscopes.**  
Catalogue, priced and illustrated, sent free.  
MCALLISTER, Optician, 49 Nassau street, New York. 3v23-ly

**WE HAVE SENT HUNDREDS OF SINGLE WALTHAM WATCHES**  
To the Pacific Coast  
BY MAIL AND EXPRESS,  
And in every case with satisfaction to the purchaser.

**The Prices are now all Reduced!**

**SOLID SILVER HUNTING WATCHES** as low as \$15.  
**SOLID GOLD HUNTING WATCHES** as low as \$65.

Our Prices are all in Greenbacks, and we deal in none but GENUINE WALTHAM WATCHES. Every one who wants a Watch or feels a desire to be posted, should write to us for our Illustrated History of Watchmaking. It will cost you nothing, as we send it postpaid without charge, and with it a full Catalogue of all the Watches with prices of each. When you receive this you will be surprised at the low rates, and you will then understand our plan of sending Watches to any place, however remote, without any risk to the purchaser.

We send any Watch you order, and let you examine it before you pay for it. Do not order a Watch until you have first sent for the Price List, and when you write please mention the SCIENTIFIC PRESS.

Address in full,

**HOWARD & CO.,**

**Watchmakers and Jewelers,**

**NO. 865 BROADWAY, NEW YORK.**

We have a full stock of extra heavy Cases, such as 4, 5, 6 and 8 oz., always on hand, and can fill all orders promptly. 26vl-bp-av

#### LEA & PERRINS'

CELEBRATED

#### Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrine have been forged, L. & P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper. Wholesale and for export by the Proprietors, Worcesters: Cross & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v22-lyeow

CHOLERA.

HOW TO CURE IT.

At the commencement of the Cholera, which always precedes an attack of the Cholera, take a teaspoonful of the Pain Killer in sugar and water (hot, if convenient), and then bathe freely the stomach and bowels with the Pain Killer clear. Should the diarrhea or cramps continue, repeat the dose every ten or fifteen minutes until the patient is relieved. In extreme cases, two or more teaspoonfuls may be given at a dose. The Pain Killer, as an internal remedy, has no equal. In cases of Cholera, Summer Complaints, Dyspepsia, Dysentery, Asthma, it cures in one night, by taking it internally, and bathing with it freely. Its action is like magic, when externally applied to Old Sores, Burns, Scalds, and Sprains For Sick Headache and Toothache, don't fail to try it. In short, it is a PAIN KILLER. Directions accompany each bottle. The Pain Killer is sold by all dealers in Medicines. Prices, 25 cents, 50 cents and \$1 per bottle.

## Mining and Other Companies.

Order to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

### Highland Silver Mining Company—Location of works, Railroad District, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 13th day of July, 1871, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the Merchants' Exchange, San Francisco. Any stock upon which said assessment shall remain unpaid on Monday, the 11th day of August, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 11th day of September, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.  
Office, No. 28 Merchants' Exchange, California street, San Francisco, Cal. July 13-7d

### I. X. L. Gold and Silver Mining Company.

Location of works, Silver Mountain District, Alpine County, Cal.  
NOTICE.—The annual meeting of stockholders of the I. X. L. Gold and Silver Mining Company, for the purpose of electing Trustees for the ensuing year, will be held at the office of the company, Pioneer Hall, 408 Montgomery street, San Francisco, California, at 2 o'clock, P. M., Thursday, Sept. 14, 1871.

J. CROWNSHIELD, Secretary.

### Jeinsen Lubricator Company—Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 1st day of August, 1871, an assessment of Fifty (50) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 428 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 7th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 28th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.  
CALEB T. FAY, Secretary.  
Office, Room No. 7, No. 428 California street. aug12-4w

### Kincaid Flat Mining Company—Location of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 4th day of August, 1871, an assessment of two dollars and fifty cents (2.50) per share was levied upon the capital stock of said company, payable immediately, in U. S. gold and silver coin, to the Sec'y, at his office, No. 229 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 11th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 24th day of October, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. H. CORNELL, Secretary.  
Office, 229 Clay street, San Francisco. aug12-4w

### Mina Rica Mining Company—Location of works, Auburn District, Placer County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 8th day of August, 1871, an assessment of Twenty (20) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room No. 2, No. 48 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 11th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 3d day of October, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. H. WATSON, Secretary.  
Office, Room No. 2, third floor, No. 48 California street, San Francisco, California. aug12-5w

### Nevada Land and Mining Company—Location of works, Steptoe, Johnson and Latham, Antelope and Clifton Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 25th day of July, 1871, an assessment of four (4) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Tuesday, September 5th, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 20th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, California. July 29-5w

### North America Consolidated Mining Company—Location of works, White Pine Mining District, County of White Pine, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 31st day of July, 1871, an assessment of Twenty (20) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Tuesday, September 5th, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 24th day of September, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal. aug12-5w

### Ophir Copper, Silver and Gold Mining Company—Location of works, Ophir, Placer County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 21st day of August, 1871, an assessment of Fifty (50) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 314 California street. Any stock upon which said assessment shall remain unpaid on the 4th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 25th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. G. BRUSH, Secretary.  
Office, 314 California street, San Francisco. aug12-4w

### St. Patrick Gold Mining Company—Location of Works, Ophir District, Placer County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 18th day of August, 1871, an assessment of five (5) dollars per share was levied upon each and every share of the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 409 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 26th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 9th day of October, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. F. CRONISE, Secretary.  
Office: 409 California street, (up stairs) San Francisco, Cal.

## BERRY & PLACE, Importers and Dealers in MACHINERY AND SUPPLIES.

SAN FRANCISCO, CAL.

Sole Agents in Pacific States for Sale of

Blake's Patent Steam Pumps,  
Smith's Wood-Working Machinery,  
Davis & Furber's Woolen Machinery,  
The Swain Turbine Water Wheel,  
Wood, Light & Co.'s Machinists' Tools,  
Sturtevant's Pressure Blowers,  
Hardy's Portable Drillers,  
Dreyfus' Patent Self-Oilers,  
Gardner's Safety Stop Governor,  
Page's Belting, Etc., Etc.

We keep in stock the above, with a large variety of other Machinery and Small Tools.

### Dreyfus' Patent Self-Oilers and Cylinder Cups.

A saving in oil of 75 to 95 per cent. guaranteed. No trouble of "oiling up!" No waste of oil! No oil cans needed!

by the use of the

### NATHAN & DREYFUS SELF OILERS.

These Oil Cups are too well known to require any lengthy description; the following are the main points of advantage.

We guarantee a saving of  
75 PER CENT OF OIL.

They are composed of a transparent Glass Cup, mounted in Brass, provided with a hollow tube, inside of which is placed a loose acting solid or hollow wire, which acts as a Feeder and Regulator. The wire rests constantly upon the Journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion.

They are as reliable in Winter as in Summer.  
Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' constant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give perfect and entire satisfaction.

No testimonials are printed, but ask any one who has them what they think of them. Be sure you get Dreyfus'. Send for Circular and Price List to BERRY & PLACE, San Francisco.

### GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.

The Gardner Governor is so well known that it is unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, positive insurance against all accidents liable to occur from slipping or parting the Governor or driving belts, and a convenient arrangement for adjusting the speed of the Engine while in motion, without change of pulleys.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used, and the machinery employed especially adapted to their manufacture. Thus we warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheerfully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE or WITHOUT THROTTLE VALVE; and either BLACK or FINISHED, as you may require. Send for Price List to BERRY & PLACE, San Francisco.

### Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup to the public, we desire to call very particular attention to its many special advantages: First—Nothing but clean oil or tallow is admitted into the Cylinder, no fine or sediment of any kind. Second—Its great economy of both tallow and fuel. Third—It is self acting, and applies the lubricating material only while the Engine is in motion. Fourth—Its certainty and regularity of feeding, and increase of the power of the Engine.

The principle upon which this apparatus is founded is that, instead of admitting tallow into the Cylinder in considerable quantities at uncertain intervals by means of tallow cups, grease cups, and other crude contrivances, and allowing it to be in fact blown out at the exhaust (as must necessarily be the case), this Cup, by its peculiar action, delivers the lubricant in drops into the body of the steam, which thereby becomes thoroughly impregnated or greased before passing into the steam chest or Cylinder; the consequence is, that instead of falling to the bottom of the Cylinder, as it does when admitted through a tallow cup (which passes the lubricant from the bottom of the Cup to the Cylinder), it enters into the form of minute globules, and hence the whole of the internal parts of the engine become regularly and constantly greased. The result of its action has been proved in a very great number of cases to be an enormous saving of tallow, a considerable increase in the power of the engine, a great saving in fuel, and reduction of internal friction to a minimum.

These Lubricators will save you 75 per cent. of the Lubricating Material, and cost no more than the common Compression Cups.

For further information, or Price Lists, address BERRY & PLACE, Importers Machinery and Mill Supplies, Warerooms, 112 and 114 California street, San Francisco.

### WOODWORTH

PLANERS.

Or: "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, COR. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricator for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the election of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. 1e18-1f

**THE PATENT****Novelty Mill and Grain Separator**

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

## Varney's Patent Amalgamator.

These Machines Stand Unrivaled.  
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been or will be spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.  
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.  
The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.  
Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

## CAST IRON PIPE, FOR WATER AND GAS.

PIPE of all sizes, of a very superior quality, is now being made at the  
PACIFIC IRON WORKS,  
In this city, under the Patents of Farrar & Whiting.

## Miscellaneous.

Sects and Creeds differ, but there are no dissenters from the general principle, that a great medicine is a great blessing. We have many of these blessings, but among them all, in the province to which it belongs, no greater than

Tarrant's Effervescent Seltzer Aperient.

A column would not suffice to enumerate the ailments for which it is prescribed by physicians of the highest standing. It does not belong to the class derisively termed patent medicines, but is an article based on scientific analysis, and will stand the test of the sharpest and most rigid medical criticism as a cathartic, a stomachic, an anti-febrile preparation, and an admirable remedy for all bilious complaints. LET THERE BE NO MISTAKE. SECURE THE GENUINE ARTICLE ONLY.  
SOLD BY ALL DRUGGISTS.

## 7-30 GOLD LOAN

OF THE

## Northern Pacific Railroad.

RAPID PROGRESS OF THE WORK.

The building of the Northern Pacific Railroad (begun July last) is being pushed forward with great energy from both extremities of the line. Several thousand men are employed in Minnesota and on the Pacific coast. The grade is nearly completed 266 miles westward from Lake Superior; trains are running over 130 miles of finished road, and track-laying is progressing at the rate of one to two miles per day. Including its purchase of the St. Paul & Pacific Road, the Northern Pacific Company now has 413 miles of completed road, and by September next this will be increased to at least 560.

A GOOD INVESTMENT. We are now selling, and unhesitatingly recommend, as a profitable and perfectly safe investment, the First Mortgage Land Grant Gold Bonds of the Northern Pacific Railroad Company. They have 30 years to run, bear Seven and Three-tenths per cent. gold interest (more than 8 per cent. currency), and are secured by first and only mortgage on the ENTIRE ROAD AND ITS EQUIPMENT, and also are now selling, at 23,000 ACRES OF LAND to every mile of track, or 500 Acres for each \$1,000 Bond. They are exempt from U. S. Tax; Principal and Interest are payable in Gold; Denominations: Coupons, \$100 to \$1,000; Registered, \$100 to \$10,000.

LANDS FOR BONDS. Northern Pacific 7-30's are at all times receivable at TEN PER CENT. ABOVE PAR, in exchange for the Company's Lands, at their lowest cash price. That is, in addition to their character as a first-class, prompt-paying Railroad security, these Bonds are in effect Land Warrants bearing a profitable rate of interest until exchanged for Homesteads, at TEN PER CENT. PREMIUM.

SINKING FUND. The Land Grant of the Road exceeds Fifty Million Acres, having an average soil of great fertility, in a climate that is simply unsurpassed. The Trustees of the Mortgage, Messrs. Jay Cooke and J. Edgar Thomson, are required to devote the proceeds of all Land Sales to the repurchase and cancellation of the Company's Bonds. This immense Sinking Fund will undoubtedly cancel the principal of the entire issue of First Mortgage Bonds (now selling) before they fall due. With their ample security and high rate of interest there is no investment accessible to the people, which is more profitable or safe.

EXCHANGING U. S. FIVE-TWENTIES. In view of the Government's expectation soon to call for the surrender of its outstanding 6 per cent. Bonds, under the present movement for funding the debt at lower interest, many holders of United States Five-Twenties are exchanging them for Northern Pacific Seven-Thirties, thus realizing a handsome profit, and greatly increasing their yearly income.

OTHER SECURITIES—AGENCIES. All marketable Stocks and Bonds will be received at their highest current price in exchange for Northern Pacific Seven-Thirties. EXPRESS CHARGES ON Money or Bonds received, and on Seven-Thirties sent in return, will be paid by the Financial Agents. AGENT for the sale of this loan are established in nearly every city and important town throughout the United States and Canada. Full information, maps, pamphlets, etc., can be obtained on application at any agency, or from the undersigned.

Designing  
and  
Engraving

By the Best of Artists,  
At this Office.

To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

**To Obtain a Patent,**

A well-constructed model is generally first needed, if the invention can well be illustrated. It must not exceed 12 inches in length or height. Where practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., SCIENTIFIC PRESS OFFICE SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer best instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS 112 illustrated mechanical movements and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid.

Also a copy of NEW PATENT LAWS of 1870.

DEWEY & CO.,

The Largest and Best in America.

The Scientific Press,

Established in 1860, is now the Largest, Most Original, Best Illustrated and most Ably and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interesting style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past or in any one other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

The progress of our journal has been steady and unvarying. Encouraged by a liberal class of readers who exhibit their appreciation in a substantial way, we shall, with our increasing facilities, experience and information, make each coming issue superior to its predecessor.

Let every friend of Science and Industry on this side of the continent take pride, not only in sustaining, but accelerating the advancement of a faithful representative of its highest interests by subscribing for it and urging its patronage by others—now, without delay.

Subscription \$4 per annum, in advance.

# SCIENTIFIC PRESS

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,  
Mining, Mechanic Arts and Inventions.

BY DEWEY & CO.,  
Patent Solicitors.

SAN FRANCISCO, SATURDAY, AUGUST 26, 1871.

VOLUME XXIII.  
Number 8.

## The Akin Roasting Furnace.

Mr. J. S. Akin, of Rye Patch, Nevada, has lately received a patent, through the SCIENTIFIC PRESS Patent Agency, for a furnace for roasting ores. In this furnace he claims to be able to extract 80 per cent. of the silver which may be in galena ore, the bullion to be 990 fine; and 85 per cent. of the gold and silver from silver ore containing gold, antimony, copper, arsenic and sulphur, producing bullion 995 fine. The starting of Mr. Akin's furnace at Rye Patch produced results that created considerable encouragement to the mining interest of that locality. He now invites parties contemplating the building of roasting furnaces to visit Rye Patch and witness the operations of his furnace. He says that the cost of passing ore through the furnace does not exceed \$2.50 per ton where the ore is crushed dry.

The following illustration will explain the construction of the device: Here *A* represents the feeding stack of a furnace, the whole of which may be built of brick, stone, or adobes. This stack is covered on the top; has an opening, *B*, leading into it at one side near the top, and connecting with the feeding hopper, *C*, and also with the fan, *D*, or other means of producing a blast. The hopper is inclined, and at its mouth opens into the upper part of the passage, *B*, and close to the stack. The ore is crushed by batteries conveniently situated and then conveyed by a screw and elevated to the hopper, *C*. As it passes down, it is caught by the blast of air from the passage, *B*, and finely distributed through the interior of the upper part of the stack, and thence falls slowly to the bottom and distributes on the revolving hearths, *H* and *K*. Two fire-places, *E* and *F*, are situated at either side of the stack, and the heated air and gas are conveyed

by flues directly into the upper part of the stack so as to descend with the falling ore.

*G*, near the bottom, is a fire-place to keep a flame on the ore on the revolving hearths, *K*. At the bottom of the stack is a revolving hearth, *H*, formed of iron or fire-brick and supported by a shaft which passes through the center from front to rear. A crank or lever on the outside of the furnace, serves to quickly rotate the hearth and discharge its contents when sufficiently roasted, and again immediately closed airtight, so as to preserve the downward draught. A series of similar revolving hearths, *K*, *K*, are arranged on the same level as the hearth *H*, and beneath each is a pit, *L*, with inclined bottoms or cooling floor, *M*, so that the discharged contents of the hearths can be easily raked out and cooled and thence fed to the amalgamators. The hearths are separated by diaphragms, or party walls, *N*, which are pierced by openings, *O*, at different heights. Only the heavier portions of the ore will fall on hearth *H*, the lighter portions will be

and *R*, are so constructed as to serve as a drying hearth for the ore before it is put into the battery.

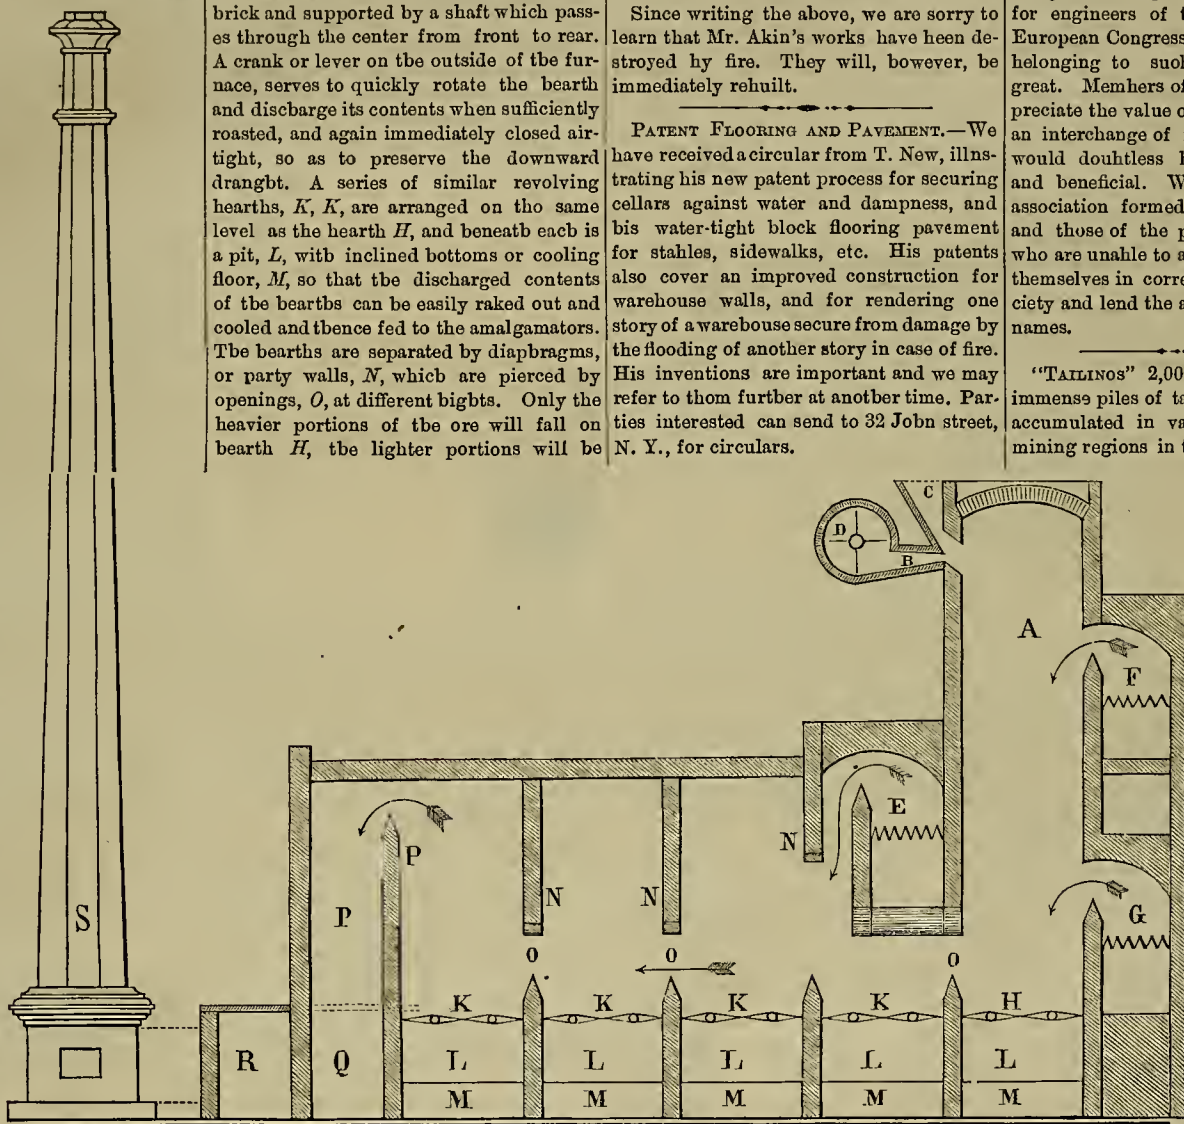

For further information, apply to Wies-ter & Co., 17 New Montgomery street, San Francisco.

Since writing the above, we are sorry to learn that Mr. Akin's works have been destroyed by fire. They will, however, be immediately rebuilt.

**PATENT FLOORING AND PAVEMENT.**—We have received a circular from T. New, illustrating his new patent process for securing cellars against water and dampness, and his water-tight block flooring pavement for stables, sidewalks, etc. His patents also cover an improved construction for warehouse walls, and for rendering one story of a warehouse secure from damage by the flooding of another story in case of fire. His inventions are important and we may refer to them further at another time. Parties interested can send to 32 John street, N. Y., for circulars.

**INTERNATIONAL ASSOCIATION OF MINING ENGINEERS AND METALLURGISTS.**—The question of establishing an International Congress of Mining Engineers and Metallurgists is being agitated in Dresden, Germany. Although it would seem difficult for engineers of this coast to attend an European Congress, still the advantage of belonging to such a society would be great. Members of other professions appreciate the value of such gatherings, and an interchange of ideas among engineers would doubtless be mutually agreeable and beneficial. We hope to see such an association formed under good auspices, and those of the profession on this coast who are unable to attend can at least place themselves in correspondence with the society and lend the aid of their purses and names.

**"TAILINGS" 2,000 YEARS HENCE.**—The immense piles of tailings which are being accumulated in various portions of the mining regions in this State and Nevada, are suggestive of the thoughtful mind of something similar to the following, which we find in a late number of the *Australasian*:—"In the year 4,000 or thereabouts, when the Anglo-Australian race shall have been 'played out' on this continent, and our posterity shall have degenerated as the Greeks have done, will the New Zealander of the period, accomplished in arts which are unknown to us, and armed with scientific appliances, such as we have never dreamed of, come over to Victoria and extract

AKIN'S PATENT ROASTING FURNACE.

carried by the draught into the different chambers over the hearths *K*, and the finest ore will be deposited the farthest from the stack. Small openings may be made in the furnace wall, and through these the progress of the roasting can be tested from time to time; when finished, the contents of any hearth can be discharged into the pit below. The heated air and gases escape over a bridge wall, *P*, and at the bottom of the flue, *P*, will enter a horizontal flue, *Q*, through which they pass and then return by a similar flue, *R*, to the chimney. Any small portions of finely pulverized ore which may be carried over the wall, *P*, will be deposited at the bottom of the flue, *P*, and in the passage, *Q*, from which it can be afterward removed by suitable doors. The top of the flues, *Q*

**THE NEW ALLOY OF COPPER AND IRON.**—Alfred Mead, editor of the *Lake Superior Miner*, Ontonagon, Mich., writes us for further information about Dr. Myers' process for forming a hard alloy of copper and iron, stating the belief that the region of iron and copper ores in Michigan would be one of the best of locations for the manufacture of the new alloy. The Doctor keeps his process a secret and we cannot give assurance of its success yet, but will report progress when positive of it.

**POSTAGE ON ENGRAVINGS.**—It is important to many not yet informed, that wood cuts and electrotypes for printing illustrations can be sent through the U. S. mails at the same rates as newspaper postage. Letter postage has hitherto been charged.

tons of gold from the tailings in our desolate and deserted gold field! The question is suggested by what is actually taking place in Attica. About 300 years before the Christian era, the silver mines of Laurium were exhausted and abandoned; but seven years ago a Franco-Italian Company obtained a concession to treat the scoria and other refuse for silver, and their operations have been conducted on so large a scale that a town containing 4,000 inhabitants has sprung up on what was formerly a solitude; a railway has been constructed to the nearest port and a small steam vessel plies twice a week between Argostera and the Piræus for the transport of the argentiferous tailings to the roasting furnaces."

LONDON has 200 female medical students.

# MECHANICAL PROGRESS.

## Iron for Church Edifices.

A new and most important use has recently been found for the universal metal, which is so indelibly stamping its name upon almost every department of progress in this remarkable age. Iron, which has for a long time been largely employed for ship building and for business structures, is now also being used in the city of Brooklyn (N. Y.) in the construction of church edifices. It is found to possess most excellent acoustic properties, can be heated quicker and at less expense than any other kind of structure, while the cost of construction is vastly reduced. Two iron churches have already been constructed in that city; a third is in process of erection; a fourth has been contracted for, and a fifth has its plans completed.

The third, now in process of construction, will cost \$61,000, and is expected to excel in every particular a neighboring church lately erected at a cost of \$220,000. The last mentioned, which has just been planned, includes an auditorium occupying a single floor, unbroken by column or gallery, and covered by a roof of 100 feet span.

It is now claimed by the Brooklyn architects that an iron church can be built for at least one-half less than one of stone of the same capacity; while it will be quite as comfortable, commodious and imposing, and with improved acoustic properties. It is believed that a "new departure" has thus been reached in ecclesiastic architecture.

**MUZZLE VERSUS BREACH-LOADING ORDNANCE.**—Experiments have lately been instituted by the English, at Shoeburyness, with a view to ascertain the relative merits of muzzle and breach-loading ordnance. The guns employed were the Prussian breach-loading, steel, nine pounder, and the English muzzle loading, steel lined, coil gun. The results are quite interesting and seem to establish the superiority of the muzzle loader for accuracy, and rapidity of fire, as well as range. These experiments seem also to contradict the generally received opinion that the Prussian breach loading steel gun is of such superior merit as has been stated.

**AN INGENIOUS DEVICE.**—An exchange describes an ingenious apparatus now in use on the Chicago, Burlington & Quincy road, which employs electricity as an agent to assist in filling locomotive tanks with water. The steam pump which supplies the tank is situated on a stream half a mile distant, and entirely out of sight. A float is so arranged that, when water is drawn off more than two or three inches below the top of the tank, a circuit is closed connected by wires with the pump-house. This sets a bell ringing within hearing of the engineer, who starts the pump and runs it until the tank is full, which is duly announced by the cessation of the alarm. The application of a similar apparatus for the direction of lowness of water in stationary steam boilers might be made, we think, to answer a good purpose, by reminding delinquent engineers of their duty before it is too late to perform it.—*Ex.*

The new railway on the Rigi, has been opened. It runs to a height of 5,000 feet, and is constructed with three rails, the middle one of which is a rack intended to work with a pawl attached to the locomotive. Each train is composed of engine and two carriages holding about sixty persons. The engine either pushes or retards the train, and does not draw it, being always at the lower end of the carriages. The fare is 5s. for the ascent, and 3s. for the descent.

**ABSORPTION OF GAS BY CHARCOAL UNDER INCREASED PRESSURE.**—Mr. Hunter, of London, has lately shown that the quantity of gas absorbed by charcoal increases with the amount of pressure to which it is exposed; and that equal variation in pressure produces nearly equal variation in the quantity of the absorbed gas.

## Effects of Cold on Metal.

We have previously taken occasion to express the hope that an extensive series of thoroughly practical experiments might be carried out by competent parties to determine to what extent the strength of metals is affected by extreme cold. In this connection, we quoted the results of trials that were made by the Darlington Iron Company in November, 1869, and described by a foreign cotemporary. The rails were taken promiscuously from a lot of 1,000 all supposed to be of the same quality, weight, and exact section. It had been found that the rails which were then in course of manufacture for the East Indian railways at these works, and which were of a very high quality, failed to pass the required test in frosty weather, whereas in ordinary temperatures a failure was a very rare occurrence. The ten rails were accordingly selected to settle the question whether higher and lower temperature affected the strength of the rails. Four rails were heated up to 120° Fahr.; the other six were tested cold, the temperature of the atmosphere being about 26°. At 120°, all the bars stood two 5-ft. blows, and one 8-ft. blow. At 26°, only one bar stood two 5-ft. blows, three broke at the second 5-ft. blow, and one at the first 5-ft. blow. At 60°, all would probably have passed the test easily, many thousands having previously done so from the same lot. It will therefore be seen that the results are in perfect agreement in all these experiments, showing that bar-iron, boiler plates, wire billets, and rails are most literally weakened by the action of intense cold, losing all their toughness, becoming quite brittle under sudden impact, and having their structures changed from fibrous to crystalline. Similar instances could be given in illustration of this in the daily practice of engineering. In large works the breakages of wrought-iron are very considerable during frosts. Quarrymen find that their chains are very liable to fracture from the same cause; and, doubtless, the numerous accidents of failing tires in our railways may be attributable to it. In many cases, however, the contraction of iron must also be taken into account, as it is a serious item. It cannot be doubted that iron does become very much weaker, both in its cast and wrought state, under the influence of low temperatures.—*Am. Artisan.*

**PILING AND SELECTION OF SCRAP.**—Some of the inferior articles rolled from scrap-iron, such as axles, owe that inferiority to the careless manner in which the "piles" are made up, by children and persons entirely ignorant of the peculiar properties of iron and steel. At the works where this scrap is used, some of the softest and toughest iron, bolts, wire, hoop-iron, old files, axes, saws, etc., are indiscriminately mixed together. To a certain extent each of these qualities have their peculiar welding points. When worked together, one portion that is less refined is too much heated, and consequently deteriorated, before the more highly refined portions have reached a welding heat, and are thus placed in the awkward dilemma of either burning the one or being unable to weld the other. The selection and piling of scrap-iron for axles is intrusted only to "experts," or those who have had long experience in the selection and working of metals; and car-axes made at these establishments have a reputation, and stand tests both theoretical and practical, such as show that this discrimination in selection of the material is a perfectly practical manner. When the selection is left, however, to the careless and incapable, the imperfections in piling become a sure source of danger and disaster.—*Ex.*

**COPPER COATING.**—The production of sheet-iron plates coated with copper and brass is a new branch of industry in England. It is claimed for the product that the plates present great advantages to the makers of finished goods, compared with tin or galvanized plates, as they can be annealed, which is requisited during the process of stamping, without injury to the copper or brass coating; and that they also are superior to sheet copper or sheet brass, because articles manufactured from them are not so readily bent or dented as when they are made of brass or copper, and they can be burnished, planished, or spun, and so brought up to any required degree of finish.

The salt formed in the boilers of a large steamer would, if not prevented by flowing off or surface condensation, amount to 20 tons per day.

# SCIENTIFIC PROGRESS.

## Experimental Investigation of a New Force.

### A Spiritualist Among the Scientists.

The last London Quarterly *Journal of Science* contains an article from William Crooks, Esq., a gentleman well known in scientific circles, in which he gives the details (with illustrations) of some experiments which he has recently made, with Mr. D. D. Home, the celebrated "spiritual medium," so called. The experiments were made in the presence of Dr. Wm. Huggins, the distinguished astronomer, and Edward W. Cox, a well known London lawyer. Both of these gentlemen endorse the statement put forth by Mr. Crooks. We condense from the article in question as follows:

The object of these experiments were first,—to test the genuineness of the phenomena produced, and, second,—to account, if possible, for their occurrence.

The first experiment was the production of musical sounds upon an accordion, under conditions which rendered the contact of hands to actuate the keys a physical impossibility. Mr. Home first held

the instrument in his left hand, reversed—the keys hanging down. When thus held in suspension, tunes were played on the lower or key-board portion of the instrument, at the same time oscillating back and forth. After this exhibition, Mr. H. let go the instrument entirely, and it still continued to give forth harmonious sounds as before, while floating about, with no visible means of support!

His next experiment was quite as remarkable, and consisted in the employment of a board 36 inches long, with one end resting upon a firm support, while the other was hanging to a delicate spring balance, as shown in the engraving.

Mr. Home placed the tip of his fingers lightly upon the extreme end of the board which rested upon the support, while Mr. Crooks and his assistant watched the movements of the indicator of the balance. The pointer almost immediately descended, and continued to oscillate up and down at short intervals, for some time. The additional weight indicated at the opposite end varied in the oscillations from 3½ to 6 pounds. Mr. Home then, of his own accord, took a small hand bell and a little can match-box, which happened to be near, and placed one under each hand, as shown in the engraving, to show, as he said, that he was not giving weight to the opposite end by pressure. Afterwards, in order to test the effect of simple pressure, Mr. Crooks applied his entire weight (140 pounds) by stepping upon the point where Mr. H. placed his fingers. The result was a depression of the pointer 1½ to 2 pounds, when he jerked down—produced, as he supposed by his toes projecting a little over the fulcrum, which was carefully guarded against during the contact of Mr. Home's fingers with the board.

The above experiments were not confined to a single evening; but were repeated some half a dozen times, always attended with essentially the same phenomena. Many other experiments were also tried and were attended with almost or quite equally remarkable phenomena.

The above facts are given in the *Journal of Science* quite in detail and with elaborate

rate illustrations, which show the utter impossibility of any trick or collusion being resorted to by Mr. Home.

The conclusion to which Mr. Crooks and his assistants arrive is "the existence of a new force in some unknown manner connected with the human organization, and which for convenience may be called Psychic Force."

Respecting the nature of this force and the correlation existing between it and other forces of Nature, Mr. Crooks does not hazard even the most vague hypothesis.

Both Mr. Huggins and Mr. Cox fully endorse the statement of facts set forth by Mr. Crooks, and Mr. Cox, in his endorsement remarks that—"The results appear to conclusively establish the important fact that there is a force proceeding from the nerve system, capable of imparting weight and motion to solid bodies within the sphere of its influence." He also adds—"I can find no evidence tending to prove that this force is other than a force proceeding from or directly dependent upon, the human organization, and it is therefore, like all other forces of nature, wholly within the province of strictly scientific investigation."

Mr. Crooks, in concluding his remarks says: "In the presence of strange phenomena, as yet unexplored and unexplained, following each other in such rapid succession, I confess it is difficult to avoid clothing their record in language of a sensational character. But to be successful, an enquiry of this kind must be undertaken by the philosopher, without prejudice and without sentiment. Romantic and superstitious ideas should be entirely banished, and the steps of his investigation, should be guided by intellect as cold and passionless as the instrument he uses. Having once satisfied himself that he is on the track of a new truth, that single object should animate him to pursue it, without regarding whether the facts which occur before his eyes are "naturally possible or impossible."

It may be proper to mention, further, in this connection that the most elaborate measures were taken to prevent any deception on the part of the medium. The experiments were made at Mr. Crooks's residence, and the room and all the apparatus was prepared by Mr. C. himself. On the special trial here detailed, and which was designed for a crucial one, the accordion was purchased by Mr. Crooks on the day the experiments were made. Mr. Crooks, when he called for Mr. Home, accompanied him to his dressing room, when he (Mr. H.) disrobed himself, and put on an entire change of garments, so as to prevent the least suspicion of there being machinery about his person to assist in the development of the phenomena.

The undoubted character of the gentlemen named, and their well known scientific and critical acumen, must place the existence of the facts which they detail entirely beyond all reach of cavil, by their brother scientists.

**ORIGIN OF HAIL.**—Prof. Reinch announces that it is impossible, in the present state of our knowledge, to proclaim a theory which shall satisfactorily explain the origin of this meteorological phenomenon.

Thus it may be safely asserted, (we quote from *Journal of the Franklin Institute*) that the conditions originating it are different from those producing the deposition of rain or snow, or that these conditions are more intense in character; yet a microscopic examination of hail proves that the conditions originating it are by no means always the same, for the structure of the product is rarely the same. He mentions the curious fact that in some hail which he examined beneath the microscope, there was found at the centers of the stones a spherical globule, which proved to be air. When those globules were nearly freed by the melting of their icy confinements, they burst the last portions of the shell with energy, and expanding, occupied in a bubble form a space more than fifty times greater than when confined; showing that they had been subject to a pressure equivalent to more than fifty atmospheres! Cold may possibly have had some part in this diminution of volume; but the temperature necessary to produce so great a reduction in volume must have reached—214° C. at the point where the hail was formed—if cold had been the only cause in play. Whatever explanation is assigned to this interesting observation, it must certainly be regarded as the most unexpected one which has yet appeared to the study of this puzzling phenomenon. Prof. R. recommends the diligent use of the microscope as the only means of solving the problem of the history of hail.

## CORRESPONDENCE.

### A Trip to Colorado.—No. 7.

BY OUR OWN TRAVELER.

#### Nevada City—One Mile from Central City.

On the California mine situated on the California lode they are sinking and improving and are already down a good depth. Ore yields from 8 to 12 ounces per cord, by milling process, and would go from two to six ounces per ton by smelting. They have all their work done at custom mills. The mine, in 1869, netted over \$100,000. The lode is from four to five feet wide and pitches to the south. There are 600 feet in the claim and it is owned by W. J. Stalker.

#### Slaughter House Mins.

This lode is located on Prize Hill and has about 20 inches of pay rock, assaying \$200 per ton. It is somewhat decomposed and is known as *gessan*. Messrs. Noylos, Longest & Tapping are the owners and they employ 6 men in the mine.

#### On the Jones Leds

They are down 200 feet and the average width is 8 inches. This ore contains considerable sulphurets.

#### The North Star Mill and Mins

Has been started up after a long interval of inactivity. This mine is located on the the Illinois lode about two miles S. W. from Central City on Quartz Hill. They have a 22-stamp mill, double discharge battery and copper plates. The engine is 75-horse power. Black's crushers are used. They are down 225 feet and the vein averages from two to four feet in width. Mr. W. J. Fuller is Supt.

On my way up to Nevada City I noticed that a water-power quartz mill was being constructed by Mr. P. Ruh. The wheel is 26 feet in diameter and is to run 6 stamps. I observed also that what is known as the Lexington mill between Central City and Nevada City, which was built in 1861, has been started up after being idle for some time past. They are about introducing the well known Stevenson Pan of which your valuable and enterprising paper has given an illustration. This is what is wanted in this section of country, and will be in operation in a few days. So we will see what can be done with it on Colorado ores. We will be particular in looking at the results, and if a favorable return is made I am assured that some 50 or more pans will be ordered for other mills.

#### The Kansas Leds

Located on the mountain between Central and Nevada City, is one of the best mines in the Territory. The well-known Hardesty Bros. own 350 feet on this ledge. They have three shafts on their claim. A large number of claims are located on this lode in small sections, say from 100 to 300 feet, and are now leased out to miners who work for one-fourth of the proceeds.

No. 1 is leased by Messrs. Gray, Bennett & Co., who employ 30 men and have sunk 120 feet in their shaft. The ore yields from 8 to 11 ounces to the cord. The smelting ore brings \$55 per ton in the hands of Messrs. Hill & Co. This company raised enough ore to pay them \$1,000 per day last week. They have a small 12-horse power engine. As I said before, the lode belongs to the Hardesty Bros. Mr. M. H. Root is Supt. This is a good part of the ledge. I say this as I have conversed with some other miners who seemed to be only sinking on the same lode, but in a very poor part of it.

Nearly all the mills now in operation are being supplied from this very rich vein and a few others. Jas. Madison discovered it in 1859. The ore contains copper and iron auriferous pyrites and will average from 4 to 12 ounces per cord; the best will go from \$90 to \$116 to the ton. Hardesty & Bro. own a fine 12-stamp mill near Nevada, at present running on ore from the "Kansas" which averages from \$6 to \$12 per cord. W. H. M.

### Colorado to Utah.—No. 8.

BY OUR OWN TRAVELER.

I left Denver at 7½ A. M., passing through Evans and Greeley cities on the road.

#### Greeley City

Has, I understand, about 1,500 inhabitants. There are about 500 houses and two hotels. The place is one mile square. They have invested \$4,000 in building ditches for the purpose of irrigation. There is at present upwards of 50,000 acres of land in cultivation in the vicinity and the property is valued at nearly \$800,000. This is the largest settlement between Denver and Cheyenne. Evans and Greeley are the principal cities in this county. I arrived at

#### Chesynne, Wyoming Territory.

At 12 o'clock, where we connected with the westward overland train of the U. P. R. R. We had ample time to partake of an elegant dinner at the R. R. station, a large house kept by G. M. Jones.

Cheyenne is the commercial center of Wyoming, situated in the valley of Crow Creek at the eastern base of the Black Hills, about 500 miles east of Salt Lake City. It derives its importance from the fact of its being a distributing depot of supplies for this trade of Wyoming and a part of Colorado. It is the junction of two lines of railway and another line has been organized under the name of the Cheyenne Iron Mountain & Helena R. R. The latter is to extend by the way of Forts Fetterman, Reno, and Phil Kearney, along the eastern base of the Big Horn Mountains to the Yellowstone river and to Helena, Montana, intersecting the Northern Pacific. This route will open up a country rich in mineral and agricultural resources.

Cheyenne contains about 2,500 inhabitants. There are immense masses of very rich iron ore found just north of the city. It is expected that when these leads are developed and the iron brought to Cheyenne for manufacture it will materially advance the prospects of the place. There are five churches, the Catholic, Episcopal, Congregational, Presbyterian, and Methodist. The city is watered by a ditch from an adjacent creek and small streams run along the sidewalks for the purpose of irrigating the trees which will in course of time tend to enhance the beauty of the place.

At 1:15 P. M. I took my seat in the finest Pullman Palace Car

On the U. P. R. R., known as the Palmyra. This car has six-wheel trucks and weighs 35 tons, almost as much as a freight car loaded with goods. It contains 28 beds and, there being one of Burdett's fine organs, some of the passengers amused themselves and us, by playing in the evening. After tea we sang some

#### Songs and Old Hymns,

The clear soprano voices of the ladies chiming in with the harsher, but still harmonious tones of the men, made the car ring with solemn notes, blending sweetly on the evening air with the steady rolling accompaniment of our carriage, drawn on by its remorseless, untiring master, the oft-mentioned "Iron Horse," the sure signal of civilization and advancement.

After the sun has gone down in all its glory of purple and gold, and we have enjoyed our evening smoke, which no one appreciates so much as a traveler, for a cigar is a companion we can always "fall back" upon, failing congenial friends, we betake ourselves to our couches, where one can sleep as comfortably as in a hotel. Moreover, we are able to sleep by the rattle of the rail which is far from disagreeable to one accustomed to railroad travel. These cars are made by the Pullman Palace Car Company.

Which was organized in 1867 in Chicago, with a capital of \$1,000,000, and it now has in its leased and co-operative agencies, a capital of \$8,000,000. Moreover, it gives employment to over 3,000 men in its "running" department.

#### Railroad Traveling made Luxurious.

Like the labor-saving inventions of this century, this enterprise transforms into pleasure what was heretofore at best, attended with weariness and danger. Now from the Pacific to the Atlantic, we can

travel without anxiety, and the good management, care and courteous vigilance of the agents enable us to travel with safety, and moreover, have all the comforts of a home without the inconveniences generally considered indispensable. The Pullman Pacific Car Company has charge of the sleeping cars on the U. P. R. R. No. 21 sleeping car being under the general superintendency of Mr. L. M. Bennett and Mr. Geo. M. Pullman, President and General Manager.

#### Sherman

Is 1,365 miles from San Francisco. It is situated at an elevation of 8,242 feet. I have a fine sample iron ore which is found in large quantities one-half mile from the station. It was given to me by John Harich, better known as "Uncle John." It is said coal can be had about thirty miles distant. I also secured a fine shell found on the top of one of these mountains only a mile from this place. It is very manifest from this and other evidences that this was at one time, ages ago, the bed of a large body of water or sea. The rocks seem to be washed and stand up prominently in many places. A few miles distant may be seen what are known as the "Red Buttes." I learn that we are traveling at the rate of 20 miles an hour. On the "west end" the grades are heavy hence the slow time.

This train left Omaha at noon on the 5th of July and passed west 132 miles. At "Lone Tree" station they encountered a terrible hail storm and I learn from the conductor and passengers, that this was the largest and heaviest storm they had ever seen or heard of. Passing on we arrive at

#### Laramie City

Which is 575 miles from Sacramento and is at an elevation of 7,122 feet. Passenger trains stop here 30 minutes for meals. Cozzus's Hotel belonging to the R. R. Co., is a fine building. Mr. L. Fillmore is Supt. of the Western Division from Cheyenne to Ogden, and Mr. S. H. H. Clark Supt. of the Eastern division from Omaha to Cheyenne.

Of the mineral resources of Wyoming Territory the editor of the Cheyenne Leader furnishes me the following information.

#### Minerals.

The mineral development of Wyoming may be justly said to be in its infancy. Nearly all the useful minerals and the precious metals are found in greater or less profusion. Gold, silver, copper, quicksilver, lead, iron, coal, oil, gypsum and asphaltum abound in many places. The gold mines of Sweetwater district, and those of the Medicine Bow Mountains and of the Big Horn Mountains are in reality just beginning to yield up their wealth. But the greatest mineral interest is found in the coal and iron deposits. These are of an extent and magnitude surpassing any other similar known area on the globe.

#### The Coal Measures of Wyoming

Over a space of nearly 100,000 square miles, extending along the line of the railroad for a distance of some 300 miles. From the location and the excellent quality of coal they contain, these fields possess a prospective importance only second to that of the great anthracite deposits of central Pennsylvania. The coal is a better article, ton to ton, than Lehigh coal for making steam, for domestic use, for locomotives and for gas manufacture, because it has less waste, ash and cinder, and burns more freely, with less trouble in kindling. It has been tried by the Union Pacific company in their cupolas at Omaha for smelting cast iron, and found to answer the purpose better than anthracite, adding to the fineness of grain and the toughness of the iron.

Passing the night and the next day in the cars we find ourselves at Ogden and from here we will make a trip to the famous mines of Utah. W. H. M.

#### Mining Hoisting Works.

Eds. PRESS:—I notice a plan of hoisting and pumping works for mines in your issue of Aug 12th. Mr. Phillips speaks of increased expense in proportion to depth which is of course true. I will give you the particulars of the workings of the double cages at the Yellow Jacket mine, which may be interesting to the mining public. They have been in constant use now for over three months. The upper cage is seven feet high and, with eccentric safety, weighs 1,300 pounds; the lower one being six feet high and weighs 450 lbs. The foreman and miners

say that the cages run much steadier than when single ones were used.

Now as to economy. With the single cage they averaged, from the 1,100-foot level and return, a trip every four minutes, or fifteen trips an hour; each draft bringing 1,500 pounds of ore or waste—allowing half a minute, (which it does not require) on the 1,100-foot level and the surface, for changing additional car, we will say five minutes for each trip; same as made before in four minutes, or twelve trips an hour. Each draft bringing 2,800 pounds to the surface, showing an increase of work done by one rope, as follows:—By single cage, 10½ tons per hour, and by new ones 16 tons, or an increase of about 120 tons in 20 hours, or 240 tons increase of hoisting capacity with the two double cages.

Formerly they started from the bottom of the shaft with 6,000 pounds of rope and 1,300 of cage to raise 1,400 pounds of ore; now, with an additional weight of 450 pounds of lower cage, they raise 2,800 weight of ore, which, as can easily be seen, is a great saving. Another economy is, that as the cages make many trips with only a man or two, now, if timber is to go down, or any men to come up, an empty or a loaded car as the case may be, is always on the lower cage. The double cages carry from 18 to 20 men at a trip whereas the single ones carried only 9 or 10. The "Yellow Jacket" company are about to hoist ore for the "Belcher" mine, and it would be supposed that it could not be done without a sacrifice of their own work.

The forsmen, Mr. Donnelly, assures me that they can hoist for the Belcher 200 or 300 tons per day, if required, without delaying their own work. With single cages this could not be done. Since the introduction of double ones, the consumption of wood has been reduced over three cords per day. One of the double cages was run, to ascertain its capacity, as fast as possible, and in 80 minutes 68 loads of 1,400 pounds each were raised from the 1,000-foot level, that is 34 trips of 2,800 pounds at each draft in all over 47 tons in 80 minutes.

Chairs are used on the levels for changing the upper and lower cars, the same as are used on the surface at mouth of shaft. By an ingenious application the lower cage passes through and allows the upper one to be changed first. The steel wire ropes used are one-half inch by five.

DEEP MINER.

THE BEAN VINE AND THE SUN.—On this side of the equator, all bean vines at all times twine the same way. Why? It has been a question whether the sun has anything to do with the matter. To settle this question, Prof. J. Parish Stelle wrote to a friend residing in Brazil, just below the Tropic of Capricorn, asking him how the bean winds there. His friend replied that it goes round the pole in precisely the reverse direction from that taken in the United States. How does the bean manage directly under the equator? Can anyone tell?—*Rural Carolinian*.

FOR TRAVELERS.—An instrument has been invented that marks "the ebb of time," showing how many minutes there are prior to any event. If placed in the post-office it reads: "Mails open in thirty minutes;" one minute later it reads, "in twenty-nine minutes;" then in twenty-eight, and so on. At a railway it reads:—"This train leaves in ten minutes," then in eight and etc., and when the index reaches 0, the train starts. Thus any passenger on entering a station knows just how much time he has for getting tickets, checks, a newspaper, and a seat, without consulting a watch or a clock to ascertain the hour of day.

THE MERCED COTTON EXPERIMENT A SUCCESS.—We have received a note from Col. J. M. Strong assuring us that his Cotton Crop at Snelling, on the Merced river is now sufficiently advanced to assure success. He says:—"I regard it as no longer an experiment. The present crop will yield far above the average crops of the South."

THE LAKE TAHOE WATER WORKS.—Col. Von Schmidt will commence work on the Lake Tahoe Water Works tunnel immediately with forty men at each end. Three hundred men will be set to work as soon as practicable.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**Monitor Miner.**—Aug. 12th: The Globe Co. have their chamber for shaft completed, and will commence sinking on the copper vein Monday next. The shaft will be sunk to an indefinite depth, and stopes run at convenient distances for the extraction of the ore. Two shifts will continue boring the main tunnel to tap the main deposit.

The Monitor & Northwestern Co. have commenced grading for their ore house. Its dimensions are to be 20x40 feet and it will be built in a substantial manner.

Next week the shaft connecting the M. & N. W. and Silver Gance mines will be completed, when the work of stoping out ore will be commenced.

### BUTTE COUNTY.

**THE HENDRICKS' DITCH.**—Chico *Enterprise*, Aug. 19th: Although designed by the Co. to facilitate the successful working of their large mining interests at Morris Ravine, the vast dimensions of their ditch, will furnish a sufficient supply to develop the finest gravel deposits of the country, which extend all along the line of the ditch, from its source to its terminus. Tests on points through which this ditch will take its way, have demonstrated the existence of rich mineral deposits, which, for the want of water, have for years laid unemployed. The ditch commences on the main West Branch of Feather river, at a point known as Meacham's Dam, distant 35 miles from Morris' Ravine, where is situated the fine mining property of the Co. constructing it.

### CALAVERAS COUNTY.

**RAILROAD FLAT.**—Calaveras *Chronicle*, Aug. 19th: At the Prussian Hill mine first class rock is being taken out. The Fifield M. Co. are busily engaged running levels and "stoping out" rock. Anderson & Co. are engaged in running a tunnel to intersect their lode. Darnell, Ayer & Co. have struck the lode after running a tunnel some 250 ft. This tunnel taps the vein at a depth of 120 ft. below the surface.

### FRESNO COUNTY.

**RIVER MINING.**—Millerton *Expositor*, Aug. 16th: The water in the river being low, the miners are making preparations for turning it, to open their claims in its bed. More activity in river mining is anticipated this season than usual.

### INYO COUNTY.

**ECLIPSE.**—Inyo *Independent*, Aug. 12th: The new mill of the Eclipse Co. is complete and ready for operating with 30 stamps, except that the new turbine wheel has not yet arrived.

**KEARSAGE.**—Thursday several new pans were put in operation, making a total of 14, all of which are kept steadily in motion.

**THE JULIA DEANE.**—The tunnel being run for this mine (Deep Spring Valley,) is now in 182 ft., but no ledge yet.

### LOS ANGELES COUNTY.

**NEW GOLD MINE.**—Los Angeles *News*, Aug. 12th: A very rich vein of gold bearing quartz has been discovered in the vicinity of Fort Tejon by J. R. Treadwell. The ledge is eight feet wide, work has been commenced upon it, three arastras having been set up. A mill is to be erected at an early day.

**FROM BRADSHAW.**—Same paper Aug. 19th: Two wagon loads of gold bearing quartz of the finest quality were received, yesterday, from the Bradshaw dist. for shipment to S. F.

**CLARK DISTRICT MINES.**—A working test of averaged rock taken from the Winnemucca mine, and worked by Lockhardt process gave \$872 per ton. A ton of assorted rock taken from the same mine yielded \$2,872 per ton. A working test of rock from the Eugenia mine gave \$9.50 per ton. Another 300 pounds of average rock worked by arastras gave 35 oz. of silver. There are 35 men at work on the mine taking out rock and preparing arastras.

**NINE COMPANIES** are at work in the district, working in the aggregate about 100 men, two arastras are in successful operation, and a number in course of construction.

### MARIPOSA COUNTY.

**MINE SOLD.**—Mariposa *Gazette*, Aug. 18th: The Francis mine, about 15 miles from this place on the Mariposa creek, has been sold to parties in Horinitos. Some of the rock from this mine assays over \$300 per ton. The reported price to be paid is \$1,100.

### MONO COUNTY.

**READY FOR OPERATION.**—Inyo *Independent*, Aug. 12th: The new ten-stamp mill, in course of construction by Messrs. Greeley, at Benton is about ready to steam up.

### NEVADA COUNTY.

**MINING LOCATIONS.**—Nevada *Gazette*, Aug. 19th: John Grannan and others have located 1,600 ft., the first Northern Extension of the Seven Thirty Loan Co.'s, in Dead Man's Flat, Nevada Co. John Jeffree and others have located ten claims of 100 feet each on the Quartz Ledge known as the Mobile Quartz Ledge, in Grass Valley Township.

**NEW YORK HILL MINE.**—Grass Valley *Union*, Aug. 16th: This mine is one of the re-opened old mines of the dist. It is now in working order, and good ore is coming out, which shows splendidly in sulphurets.

**ALTONA MINES.**—Yesterday 600 shares of stock in two lots were sold. One lot of 200 shares sold at \$5 per share, and the other 400 shares at \$4.

### PLACER COUNTY.

**JUNCTION DIVIDE.**—Auburn *Herald*, Aug. 19:—A company of Sacramentians have located and recorded a mining claim at the Junction of the North and Middle forks of the American river. The locators are T. P. Ford & Co. The capital stock is \$90,000, in 1,800 shares of \$50 each.

### SIERRA COUNTY.

**QUITE A CHUNK.**—Downville *Messenger*, Aug. 19: Some men working a claim on St. Charles Hill, at the head of Fiddle creek, near Brumwell's ranch, between Brandy City and Eureka, recently found a piece of quartz and gold, weighing 64 lbs. The gold has been stopped in S. F. to await developments.

**PRIMROSE.**—The workmen in the Primrose mine, Hog Cañon, have completed the work of raising the shaft and will commence crushing rock next week.

**SHAFT BROKEN.**—The shaft of the main wheel at Kanaka mill, recently gave way.

### SISKIYOU COUNTY.

**THE FLUMING ENTERPRISE.**—Yreka *Union*, Aug. 19: We are sorry that obstacles have arisen to the project for the fluming of Yreka Creek, which may prevent the enterprise being undertaken. Many old claims which were believed to have been abandoned, have been revived again. The claimants demand to be bought out at high figures or threaten to interfere with the work if they are not. If parties have valid rights, they must be respected, but it is to be hoped they will show a disposition to compromise on liberal terms. And where parties are trumping up claims, they should meet with the contempt and execration which their baseness deserves.

### TUOLUMNE COUNTY.

**MINING DITCH AT LAGRANGE.**—Stockton *Independent*, Aug. 19: The water to supply this ditch is taken from the Tuolumne river at Indian Bar, high enough to wash the highest gravel hills in the vicinity of Lagrange. Four hundred men are now constantly at work on this enterprise, which will be completed by Jan. 1872.

## Nevada.

### COPE DISTRICT.

**BULL RUN DISTRICT.**—Elko *Independent*, Aug. 19th: Mr. Hartwell, operating for English capitalists, has purchased two of Governor Chellis' mines, the Monument and Found Treasure, for \$32,000. Mr. Hartwell will put a mill into Bull Run and have it in running order by the first of next January. The Silver Belt and Revenue mines are looking finely. The Revenue Co. has 40 tons of chloride ore on its dump, that will work \$100 a ton by wet process. The Revenue has a splendid ledge six feet in width. The Blue Jacket Co. is working four men and taking out splendid ore. The Buster mine, owned by McDonald & Bowman, is looking well. The Excelsior Co. has struck another rich chimney north of the old works on that ledge.

Harris and Loveridge continue to take the richest of ore from the Independent mine. They are running levels, etc., at a depth of 120 feet.

Hays, Niver & Co. are running levels on the El Dorado at a depth of 75 ft. This ledge is fully five feet wide and very rich.

The boys on the Ku-Klux are now down 50 ft. on their ledge, which is four feet wide, and have \$250 milling ore.

The Monitor is being worked from its 60-foot level.

The Kanahwa consists of sulphuret and chloride of silver, with a trace of quartz. The proprietors have about 30 tons of rich mineral now out.

The Norton mill is idle just now, wait-

ing for shoes and other castings.

The Davis mill is constantly employed on high grade ores, guaranteeing 80 per cent. on pulp assay, and charging \$30 a ton for working, roasting, &c.

**CLOVER VALLEY.**—V. B. Latham, Wiseman Brothers, Thomas Kane and Nick Schore, joint owners in the Latham ledge in Spruce Mountain, have sold the ledge to Crawford & Co., of Philadelphia, for \$30,000 coin. Crawford has gone to work as if the mine was business, furnace, machinery, etc., being ordered and en route to the district.

J. G. McIlheeny, of Clover Valley, sold his interest in the Agate ledge in Kane district to a Dubuque, Iowa, firm for \$1,500.

**RAILROAD DISTRICT.**—Ore is being shipped to Palisade from the Lec mine.

The Brosmer or Elko tunnel is working in a six foot vein. Mr. Hussey will set 20 men to work at once, and more as soon as they can be worked to advantage.

The cry is laborers, laborers. There is room for a large number of good miners. The Wormer mine is looking well. Its owners feel much encouraged.

The smelter failed to work on account of the great disparity in the size of blower and the engine. Adam Haag has ordered a new engine and boiler, which is expected daily.

Stiles & Banning took to Elko the third load of the Roulstone copper ore from the Emma mine. Roulstone has bought a hundred tons to be shipped to San Francisco.

Mr. Carter says the Lee mine has as perfect wall rocks as he has ever seen.

The Elko tunnel is now 145 ft. in length and still progressing.

### EUREKA DISTRICT.

**BULLION SHIPMENT.**—Austlin *Reveille* Aug. 18th: The Manhattan Co. have ready for shipment 22 bars of bullion weighing 2,200 pounds of the aggregate value of about \$28,000. They have also on hand about ten bars more, in crude bullion and amalgam ready for the retort. All this is from the working of the mill from the 5th until the 15th inst., less than two weeks.

**HEAVY SALE OF MINES.**—Euroka *Sentinel* Aug. 16th: It is said that John C. Fall, of Unionville, has sold his interests at that place for \$1,000,000.

**WIDE WEST MINE** is now being worked by a small force of men. The ore is looking finely.

**NEW PHENIX FURNACE.**—The flushing of this furnace will be complete in a few days. It will be started as soon as the Supt. arrives.

**CONSOLIDATED.**—For the 24 hours ending yesterday, the Consolidated furnaces turned out 18 tons of bullion, which assayed \$455 to the ton of metal. No. 4 furnace has been running for 11 weeks without repair. No. 5 has been running nine weeks and is to all appearance as perfect as when the fire was applied to it.

**RICHMOND FURNACE.**—This furnace was closed for three days for the purpose of relining it. The Pancake stone was ready and was put in as soon as the furnace was cool enough. The bullion is leaving the furnace as usual, and the Richmond bullion is quite as rich as any that has ever been made in Eureka.

### ELY DISTRICT.

**BULLION SHIPPED.**—Ely *Record*, Aug. 17th: Wells, Fargo & Co. shipped since our last issue, 22 bars valued at \$30,758.96 and for 3 days ending Aug. 13. 19 bars valued at \$32,467.37.

Assays of six bars of bullion from the Raymond & Ely Co.'s mines gave \$26,485.05.

**GOLD DISCOVERY.**—On Thursday last no little stir was created in Pioche by the discovery of gold in an old location south of Gleason's Boarding House. The shaft is about 10 feet deep, exposing a narrow seam of red decomposed quartz, which will assay in gold over \$50,000 to the ton. Mr. Egan, Supt., of Meadow Valley Extension Co., washed out over \$5,000 in pure gold from two handfuls of dirt. The discovery was made by a Mr. Parker. Several tons of this ore can be obtained to a certainty.

**LOOKING UP.**—The mines located at the upper end of Main street at present looking up. Russell Scott, Charley Noakes and others, owners of the Justice, are putting down a shaft 4x8 feet, and expect to strike the ledge at a depth of about 100 feet.

They are now sinking day and night in order to tap the vein which is doubtless rich. Many shafts are being put down in the immediate vicinity and all give promise of success.

**THE MARY**, owned by J. J. and M. D. Halpin and C. Felsenthal located for silver proves to be a gold mine as well. The vein is about 2½ feet.

### HUMBOLDT.

**RICH STRIKE.**—Unionville, *Silver State*,

Aug. 19th: A rich strike is reported in the Agammemnon. The ledge is 3 ft. wide and rich beyond expectation, two men are at work extracting ore, and a pile of several tons, all "pay rock," is now on the dump awaiting transportation for reduction. The Agammemnon is encased in quartzite and conglomerate rocks, and although it crosses the hill in which the Arizona is located but a short distance (about 1,200 feet) from the outcroppings of that mine, no limestone is visible on the surface along its course, which is already defined, though the conglomerate which forms the northeast wall and extends in to the country an indefinite distance in that direction, is evidently a sedimentary formation.

**BUENA VISTA DIST.**—A shaft was sunk on the Eclipse 80 feet deep, some months since, disclosing a ledge three feet in width, with a rich pay streak next to the foot-wall, of 24 inches. A large body of water being encountered in the shaft, it was abandoned. A tunnel was then started in several hundred feet lower down the hill, and will in 25 ft. more, reach the main body of ore 300 feet below the surface.

**ARIZONA CONSOLIDATED.**—Ore of a high grade is being extracted. Forty tons a day is about the average yield. The company's mills are steadily employed on ore from their own mine.

**HENNING.**—This Co. have run a drift 70 feet, following the ledge, which is seven feet wide, and shows a very good quality of ore.

**INSKEEP.**—The ledge is now about seven feet wide.

**STAR DISTRICT.**—The De Soto is looking as well as ever. There is a well authenticated rumor that negotiations are pending for the sale of the De Soto mine to the Nevada L. & M. Co., Reno.

**MILLER'S GOLD MINE.**—Mr. M. still continues the working of his gold mine in Star creek.

**SHEPA.**—Hands are engaged in extracting ore. The mine shows a well developed vein, of high grade ore. The first-class ore is sacked and shipped, while the second-class is laid to one side for milling purposes.

**BURNED.**—Aug. 21st: The Butte mill and smelting works, at Rye Patch, were entirely consumed with a large quantity of wood, yesterday evening, loss \$40,000. Insured.

### WASHOE.

**BULLION SHIPPED.**—Virginia *Enterprise*, Aug. 13th: The Bank of California, in this city, day before yesterday, shipped \$22,000, and yesterday \$14,000,—total, \$36,000—in silver bars. The bars were from the Savage, Crown Point and Yellow Jacket mines.

**BULLION RECEIVED.**—Aug. 17th: By the Bank of California, \$62,000 in silver bricks from the Crown Point, Yellow Jacket and Savage mines. Day before \$12,000.

**ORE YIELD.**—The Savage mine yielded 500 tons of ore last week, assaying \$28.21 per ton. Hale and Norcross 80 tons, the mine not being in condition just now for extensive ore extraction.

**LADY BRYAN.**—The Co. have taken out and sacked a considerable quantity of ore which they intend having worked by the Stetefeldt process at the Auburn mill, Reno. We were yesterday shown a couple of assays from the grades of ore. They were as follows: No. 1, \$2,457.56; No. 2, \$843.01. A car sample of the ore now coming out of the mine, assayed yesterday, yielded at the rate of \$260.25 in gold and silver. The dump is now full of ore, and the mill will start up again in a few days.

**THE Woodville** lead is now being successfully worked on Gold Cañon, between Devil's Gate and Lower Gold Hill. A tunnel has been run in upon the lead from the bed of the cañon a distance of 167 ft. the ore taken out in running the tunnel has yielded \$400 above all expenses. The vein is from two to five feet in width, and is what is called gold-bearing, the per cent. of silver in the ore being small. The average yield of the ore thus far has been \$25 per ton.

**BUCKEYE.**—The small pumps at this mine are running for the purpose of raising water for mills in the vicinity, but they do not much decrease the water in the incline. Some prospecting is being done in the upper works. The machinery is now being put in order and will soon be set up.

**ORE.**—Gold Hill *News*, Aug. 15th: A good body of ore is reported to have been found in the Savage mine, at the 3d level from the new shaft, also two or three pretty good deposits in the old upper workings. The mine is yielding 150 tons per day at present.

**THE JULIA.**—This mine is about to be reopened and properly worked. It lies just

cast of the Comstock, and oposito the Chollar-Potosi mine.

**OCCIDENTAL.**—This mine is to be worked again under its own proprietorship.

**DISCOVERY.**—Mr. Phelps, of Silver City, yesterday showed us two assays from a lead just discovered by him a short distance below that town. The average was \$105.87, from ore dug upon the surface.

**SUTRO TUNNEL** was yesterday in a distance of 2,332 feet. The ground is working well, and no water is coming in at the face of the tunnel.

**WHITE PINE.**

**BULLION FORWARDED.**—White Pine News, Aug. 12th: Wells, Fargo & Co., shipped today to New York, 2 bars of bullion weighing—lbs., valued at \$2,411.00—the product of the Ward Beecher Consolidated mine.

The shipments of bullion for the present week foot up 2,776 pounds, valued at \$18,241.30.

**WARD BEECHER.**—The strike on the south line of this mine has proved itself to be rich and extensive. The connection between the main shaft and the Earl chamber is completed. The surface dumps still remain crowded with ore, which is shipped daily, by team, to the Oasis, Stanford, and international mills. Working 90 men.

**SOUTH AURORA.**—A large amount of ore is piled at the tramway loading station of this mine. Working 30 men.

**EBERHARDT.**—There is a large amount of low-grade ore on hand, but not being shipped. Will ship ore again as soon as the tramway is running. Working 30 men.

**SOUTH AURORA.**—Prospecting and development are being vigorously pushed, and the mine put in good working shape. Working 90 men.

**OUTSIDE DISTRICTS.**—SCHELL CREEK.—During the present week ore has been brought in to the Big Smoky mill from the McMahon and Needham mines. The ore from the former worked \$305.24, and that from the latter \$188.14 per ton.

**PATTERSON.**—A lot of ore from the Rob Roy, gave an average pass assay of \$195.56 per ton.

**PINTO.**—The English company is prosecuting work on the mill and the Stetefeldt furnace with great vigor, and, barring accidents, will have everything in working order before the snow flies.

**TEM PIUTE.**—Dave Hunt has just returned from this District, and speaks highly of its prospects. He has a force of men at work, opening the Kinsey and Rattler mines, and has made arrangements for conducting the water to the mill-site of the company.

**PIERMONT.**—During the present week a lot of bullion was brought in by Mr. Tregloan. The Piermont company has been delayed in its operations by a scarcity of miners; but this deficiency is now supplied; the mines and mills of this Co. will work regularly in the future.

**THE MONTE CNERIO** machinery is nearly all set, and the mill will be finished and ready to commence crushing ore next week. The company will commence work on its mines—11 in number—as soon as the mill starts, and expect to take out ore enough to keep the mill running steadily.

**Arizona.**

**YAVAPAI COUNTY.**—Prescott *Miner*, Aug. 5: The foreman of the original Tiger Co. states that he has over 20 tons of ore, ready for shipment to S. F. which would pay at the rate of \$1,000 to the ton. We have seen 20 pounds of this ore, and pronounce it the richest silver rock ever seen by us. Some of the pieces show wire silver in abundance, and the clusters thereof are exceedingly beautiful. The specimens are heavily freighted with black and "diamond" sulphurets. In the mine, too, is an 18-inch stratum of silver and copper glance, some of which was recently assayed, yielding per ton in silver \$1,044, and \$30 in gold.

The Lorena, Cougar and other Bradshaw ledges are still contributing considerable ore, containing free silver, horn silver, etc.

Rock was brought to town this week, from a newly-discovered ledge, in the vicinity of the Quartz Mt. saw-mill, which is said to be well charged with horn silver. A rush was made for the mine, and many locations have been made upon it.

The silver ledge recently discovered within a mile or so of Prescott is being opened and promises fairly.

At Black Cañon, the Mexicans are preparing to construct arastras to work ore from the Angustin and Sonora lodes.

In Weaver district the owners of the Columbia are working away.

The Vulture Co.'s mill at Vulture City, is working. Every ton of ore crushed for

some time past, and has paid upwards of \$90.

**SUMO** paper Aug. 12:—Poland & Co., are developing the Espinosa lode.

A. B. Smith & Co. are taking very rich gold ore out of the Moreland.

The rock from the Great Sexton lode, Weaver district, recently worked at the Vulture mill, gave good satisfaction.

**Idaho.**

**SASKATCHEWAN MINES.**—Silver City *Aratanche*, Aug. 12th: Mr. Pambrum, who wintered in the Saskatchewan, reports only a few miners there. They take out \$10 to \$15 per day, but provisions are almost impossible to be obtained.

**WARREN'S DIGGINGS.**—Idaho *Statesman*, Aug. 12th: A great many men are finding their way to that camp, and the prospects for it to turn out a good mining country are daily increasing.

**BASIN ITEMS.**—The Gold Hill mill made a big clean-up last Sunday, after a month's run. John Good, in working his placer mines in the gulch above the Gold Hill mill, discovered, a few days ago, a well-defined ledge, the ore from which is said to prospect well. Mr. Eissler has a force of men engaged in taking out ore from his lodge at Gold Hill, and T. S. Hart is pushing forward work on his mill at the Lawyer.

**ITEMS.**—Silver City *Aratanche*, Aug. 12: Last Tuesday a four-foot ledge was struck at the bottom of the 7th level, south of the shaft in the Chariot, said to be rich. The Mahogany is yielding a splendid quality of ore. The new wire hoisting rope for the South Chariot has arrived. A contract was lot this week to sink the main shaft 100 feet deeper, at \$17.80 per foot. There are now between 30 and 40 men at work in the Oro Fino which is yielding good looking ore. Vein from 4 to 7 ft. wide. The Ida Elmore Co. have elected a new Board of Trustees who, it is said, will immediately resume operations on the mine. Arrangements have been made to incorporate the Skookum which is one of the best mines in Camp.

The south shaft of the Idlewild is down 38 ft. The pay streak is only some two or three inches in width, but is exceedingly rich in gold.

The Empire looks better than ever. The parties at work on the Morning Star got the water out of the mine last Monday and are ready to take out ore.

Splendid looking ore continues to be taken from the Noonday.

Sands & Co. will resume operations on the Illinois Central before long.

W. B. Knott is working his mine on Florida mountain and has from 25 to 30 tons of ore ready for crushing. It is very rich in gold, and good judges estimate that it will yield from \$200 to \$250 per ton.

**Montana.**

**PILGRIM BAR.**—Deer Lodge *Independent*, Aug. 11th: The Rock Creek Ditch is running 1,700 inches of water, 17 hydraulics are running on the Bar and in its immediate vicinity, nearly all of which are paying well. Joe Steele & Co.; Hagan, Timberlake & Co.; Holcomb & Deery; Roe & Bell and Brelsford & Co., have been taking out regularly from \$1,000 to \$3,000, per week. Clayborn, Smith & Co., have one of the best claims on the Bar. John Rogers & Co., have just reached good pay in their claim on Gold Hill, and John Thomas & Co., have just commenced work on good ground near the same locality. Nathan Smith & Co., have lately commenced operations on some of the best ground on the bar.

**NEW GOLD DISCOVERY.**—Kelcher and Dick, have just started out to develop a newly-discovered quartz lead in the mountains immediately west of James Buckley's house, Bitter Root Valley. This lead was staked by somebody in 1867, but was never sufficiently explored to determine anything concerning its richness.

**DITCH SALE.**—Deer Lodge *New North West*, Aug. 12th: Mr. R. C. Allen came down from Silver Bow yesterday bringing "good news from Ghent." Mr. Allen sold, and on Monday gave possession of, his one-half interest in the Bellanger & Allen Ditch to Jacob Herman of Butte for \$6,000 cash.

**Utah.**

**TREASURE SHIPPED.**—Salt Lake *Review*, Aug. 16: Wells, Fargo & Co., shipped yesterday 5 bars, \$57 lbs., valued at \$16,390.64, owned by T. & E. M. Co. Also 14 bars, 1219 lbs., valued at \$16,076.48.

**BIG COTTONWOOD.**—Another smelter is being erected, and prospects were never better for a permanent and profitable mining camp than at Belleville or Silver Springs.

**Mining Stock Market.**

THURSDAY EVE., AUG. 24, 1871.

We report an increased amount of business in the Board during the past week, mainly due to a remarkable activity in Yellow Jacket, of which over 13,000 shares changed hands at an approximate valuation of \$845,000. A large number of what are called outside stocks participated to a large extent, under advancing rates, but toward the close less firmness prevailed with an inclination to lower figures. The general tone of the market is healthful, and these remarks are particularly applicable to the Comstock claims, the whole range presenting favorable features for a large future production of argentiferous ores.

The sales in the San Francisco Stock Board, from August 17th to the 23d, inclusive, have been as follows:

70 shares Alpha at \$20.00	50.
10 shares Beta at \$25.00	25.
1043 shares Belcher at \$22.25	217.
650 shares Buckley at \$1.75	25.
6869 shares Chollar-Potosi at \$30.00	32 3/4.
840 shares Columbia at \$16.00	22.
445 shares Crown Point at \$20.00	50.
696 shares Eureka at \$10.00	50.
730 shares Eureka Consolidated at \$10.00	25.
710 shares Gould & Curry at \$10.00	104.
200 shares Golden Chariot at \$24.00	50.
706 shares Imperial at \$20.00	40.
720 shares L. & N. at \$25.00	25.
440 shares Kentucky at \$11.00	135.
600 shares Lady Bryan at \$3.00	25.
6863 shares Mahogany at \$13.15	25.
370 shares Nevada Consolidated at \$20.00	50.
300 shares Monitor and Magnet at \$7.75	30.
1413 shares Ophir at \$10.00	75.
2182 shares Ophir at \$10.00	75.
565 shares Overman at \$6.00	50.
2510 shares Picoche at \$13.15	125.
5775 shares Phoenix at \$1.25	25.
240 shares Pioneer Valley at \$21.00	50.
3585 shares Raymond & Ely at \$18.75	75.
170 shares Sogroated Belcher at \$5.00	75.
2700 shares Succor at \$10.00	50.
2280 shares Sutter at \$25.00	25.
13,213 shares Yellow Jacket at \$41.50	66.
200 shares Yale at \$11.00	25.
351 shares Hale & Norcross at \$30.00	25.
100 shares St. Patrick at \$3.00	25.
1220 shares Crown Point South at \$5.00	25.
310 shares Noonday at \$5.00	25.
400 shares Ophir at \$10.00	25.
6 shares Daney at \$5.00	25.
100 shares Marble Falls at \$5.00	25.
1000 shares Julia at \$5.00	25.
300 shares Main at \$5.00	25.
6 shares Spring Valley Water Co. at \$75.00	25.
200 shares Front-street and O. Railroad Co. at \$18.75	19.
Amount of sales.....	\$2,739,222.

**MEADOW VALLEY** (Pioche, Nevada)—sold to a considerable extent at well maintained prices. From the annual report of the Secretary for the two years ending July 31st, 1871, we take the following statement:

From Bullion.....	\$1,671,465
Assessments.....	210,000
Other receipts.....	95,361
Unliquidated liabilities.....	95,361
Total.....	\$1,981,042

Dividends.....	\$330,000
Mine properties.....	289,558
Mining account.....	474,738
Milling account.....	357,336
Construction account at mine.....	44,804
Construction account at mill.....	214,065
Miscellaneous.....	98,176
Unliquidated liabilities.....	192,392
Total.....	\$1,981,042

Amount of ore extracted, 17,458 tons; reduced, 16,171 tons. The cost of production was as follows: Extracting, \$14 20; prospecting, improvements, etc., \$10 30; reduction, \$19 60—total cost, \$44 11, while the average yield amounted to \$105 34 per ton. The permanent investments of the company aggregate \$548,428, while other resources foot up \$240,600. Liabilities, \$95,360.

**CHOLLAR-POTOSI**—has been quite active, under a slight improvement. For the week ending August 19th, 903 tons of ore were extracted, showing an average yield of \$44 20 per ton.

**HALE & NORCROSS** is quiet. They took out 311 1/2 tons of ore for the week closing August 19th. An assessment of \$10 per share was levied on the 21st inst. **Savage** shows a yield of 850 tons of ore for the week ending August 20th. **Belcher** was less active at a decline from last week. A letter of the 20th says: The ore in the incline is improving as we sink. The top stratum of pay ore continues about the same, showing \$207 per ton. We have a stratum of very good pay ore coming in on the bottom of incline. **Crown Point** continues quiet at a recession. During the week ending August 19th, 1,192 1/2 tons of ore were extracted, showing an estimated value of \$43,567. **Empire** levied an assessment of \$12 per share on the 23d inst.

**MINING STOCK QUOTATIONS, AUGUST 24, 1871.**

## PATENTS & INVENTIONS.

### Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

#### FOR THE WEEK ENDING AUGUST 8TH.

**VARIABLE CUT-OFF FOR STEAM ENGINES.**—William B. Cross, Sacramento, Cal.  
**POULTRY FOUNTAIN.**—John S. Orndorf, Virginia City, Nevada.  
**PADDLE-WHEEL.**—Nathaniel P. Sheldon, San Francisco, Cal.  
**JOURNAL BEARING.**—Sydney P. Cook and Hiram Burt Cook, San Francisco, Cal.  
**MEDICAL COMPOUND FOR TREATING RHEUMATISM, ETC.**—Wm. Curless, Truckee, Cal.  
**DENTAL INSTRUMENT.**—Charles H. Mack, Portland, Oregon.  
**WASHING MACHINE.**—Alfred T. Sullivan, San Jose, Cal.  
**MEDICINAL BEVERAGE.**—Asher S. Taylor, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

#### Dr. Bly's Anatomical Leg.

We insert herewith a sectional elevation of a new artificial leg, which has recently been invented, and introduced to the public at the East by the inventor, and which has more recently been brought to this coast by Mr. Menzo Spring, who has established a manufactory for the same at 101 Jessie street, near the Grand Hotel, in this city.

To obtain an artificial leg, with all the varied motions of the natural one, has been the study of anatomists and mechanics for many years, and the present degree of perfection has been reached only by slow degrees and with the most patient experiment and observation. Bolts and pins were largely employed by the earlier inventors; but the constant wear of such things soon rendered them loose and shackley and next to useless, while at best they were only poor substitutes for the bones, muscles and sinews of nature.

Dr. Bly has endeavored to imitate nature as closely as possible, and to that end starts with a universal joint at the ankle, which approximates as near to nature as art can approach.

Referring to the accompanying illustration, the ankle joint is formed by a ball, *B*, of polished glass, plying in a socket of vulcanite of india rubber, which is a joint that admits of every motion that the natural ankle does, without an exception, and is the first joint ever invented which never requires oiling.

*S* represents three of the four india rubber springs, which take the place of the tendons which pass through the springs with screw-heads on the upper ends. Only three are shown in the figure here, but the lower ends of all four are shown in Fig. 2. *N*, the nuts by which the tension of the tendons and springs are regulated to suit the wearer; and *E*, the spring which operates the knee joint.

The ankle joint is made without iron or any kind of metal, therefore the leg is extremely light—much lighter than any other. The liability of metallic joints to rattle and make a noise, after the leg has been worn a short time, is well known, and the annoyance which it causes the wearer at every step is also well known. Now, as there is no metal about this, there cannot be any noise. The joint is formed by a ball of polished glass, plying in a socket of vulcanite of rubber. (See Fig. 2).

This joint accomplishes the great object which all artificial leg makers have hitherto sought for in vain, viz: it admits of motion in all directions, like the natural ankle joint, and thereby allows the artificial foot to accommodate itself to the varied inequalities of the surface, the same as the natural foot. It often enables those who wear it to walk so well, that it is not even suspected, much less detected. Furthermore, this is a joint which requires no oil, a fact of no little importance, as those will testify who have worn legs with metallic joints, and been obliged to carry pocket oil cans.

In the places corresponding to those occupied by the muscles of the natural leg, are placed india rubber springs with tendons, as shown in our illustration, extending downward in place of the natural tendons; and it is quite interesting to see how well the action of the rubber springs imitate those of the natural muscles. These rubber springs or artificial muscles, together with the ball and socket joint, produce every motion of the natural leg, without an exception.

The power and action of all the springs are regulated simply by turning a nut, so that the wearer may adjust them to suit his own peculiar gait, with great nicety.

Instead of the mechanical motions given a limb by metallic springs, the rubber springs impart easy, uniform motions to the limb, like those of the natural muscles, which give it, when in use, a remarkably life-like appearance.

In walking, when the weight of the body rests on the ball of the foot, the spring

The spring, *E*, operates the knee joint, and, assisted by the one just referred to, carries the foot forward at each step, with any degree of motion desired to suit the peculiar gait of the wearer; it being india rubber, and adjustable like the others.

The motion of the knee joint is limited and controlled by the cord, *H*, which takes the place of the crucial ligaments of the natural knee joint; consequently there is no unpleasant or painful jar, caused by the solid parts coming in contact, to limit the motion, as in the old fashioned legs. For further particulars, apply to Mr. Spring, as above.

#### The Wonders of California.

There are but few countries that possess more of the beautiful, unique, picturesque or grand than California. Wherever the traveler goes—in whatever direction—he

VIEW OF THE BRIDAL CHAMBER.

representing the gastrocnemius and soleus muscles is firmly compressed, and when the weight of the body is thrown forward on to the other foot, the spring rises and carries the foot forward to its place, with very little effort of the wearer. By the action of this spring, lifting the foot in a great measure and carrying it forward, the wearer is materially relieved from the

is sure to meet some wonder which is especially Californian in character, and which can rarely be equalled in any other part of the world. Towering mountains, majestic forests, leaping waterfalls, broad valleys, deep and far-reaching caverns, or some other wonderful thing is constantly inviting the traveler to tarry, to look and admire. Among other wonders

"That are but parts of a stupendous whole,"

We may mention prominently the oaves of Calaveras and El Dorado. The former was discovered in 1850 and pre-empted in 1853, by Messrs. Magee & Angell, who erected a hotel near by for the convenience of the numerous visitors which were then flocking thither to inspect this curious work of Nature. This cave is not so remarkable for its dimensions, as for the beauty and unique grandeur of its interior.

The most interesting and striking localities in this cave are known as follows:—A large room near the entrance, called the "Conical Chamber," the walls of which

Fig. II.

greatest burden of artificial legs, viz: weight.

When walking, if one side of the foot happens to be placed on a stone or elevation, or into a hole, the mobility of the ankle joint allows the foot to yield just enough to accommodate itself to the inequality, and thereby prevent straining the stump, or stumbling or falling, which necessarily takes place more or less with all legs which do not admit of lateral and diagonal motion at the ankle joint.

The knee joint is formed by an axial bolt plying in two segments of a circle, one of which is adjustable, to prevent looseness and noise.

are massively solid rather than beautiful. From this the traveler ascends to another large room called the "Cataract," a name which it well deserves from the perfect resemblance to rushing waters which its white depositions of lime present. We come next to the "Cathedral," a large, circular room, covered by a dome-shaped roof sixty feet high. From thence the visitor is shown into the "Bishop's Palace," near the center of which stands a perfect likeness of a full-robed Roman Bishop, minus his head.

Passing on a little further we reach a room of magnificent proportions, beautifully ornamented, with an innumerable number of snow-white pendants—stalactites—hanging in almost every conceivable form. Some like garments hanging in a wardrobe, with every seam and fold complete; others resembling beautifully arranged curtains; others still presenting portions of fluted columns, pendant, and others pear-shaped or pointed. When a light is raised aloft, behind or among these beautiful, alabaster-like formations, the effect is beautiful beyond conception. The reflected rays glance through and among the myriads of varying forms, white as snow and translucent as crystal, presenting a sparkling glory that surpasses anything ever seen in art or conceived in fancy! This room has not inaptly been called "The Bridal Chamber"—its walls and floors and hangings of spotless white being emblematical of purity, love and innocence.

Through the courtesy and favor of the publishers of "Scenes of Wonder and Curiosity in California"—Messrs. A. Romsen & Co., of this city, we are permitted to present to our readers the accompanying view of this fairy scene. At the distance of about one-sixth of a mile from the entrance is another room known as Musical Hall. The localities described are but the more striking features of this interesting locality, which, with the wonders of California, is more fully described in the work above mentioned.

**OBSERVATIONS ABOUT COAL.**—According to the Fourth Volume of the Report of the Geological Survey of Illinois, which has recently been published, our bituminous coal is not amorphous in its construction, but is built up of thin layers of crystalline matter, about one-eighth of an inch in thickness, and separated from each other by a thin filing of pulverulent, mineral charcoal, which consists of a compound of cellular tissue and of the vessels of plants. The outline of the plants which go to make up these separating films, is often so perfectly preserved, that the genera, and even the species to which the remains belong may often be recognized at first sight.

In cannel coal, which is supposed to have been formed under water, the distinctive forms of this vegetation has been generally lost by a more perfect decomposition. Even in the anthracite of Pennsylvania, which has been subjected to heat, so long as to become fused, as it were into cohesion, one can easily discern not only the separating films, but an abundance of remains of plants, also, whose genera, and even species are sometimes recognizable.

These facts have been well ascertained by microscopical examinations; and it is suggested that they should be taken into account in examining new theories in relation to the formation of coal.

**SULPHUR.**—The *Alta* says that the sulphur refinery establishment on the eastern bank of Clear Lake was closed on the first of the month, on account of the retorts being unfit for longer use, and from the further fact that the company have now 400 tons of refined sulphur on hand, while the annual consumption in the State is only 700 tons. The price of the imported article is now so low, and the amount of the crude article in sight at the company's works so small, that it is considered doubtful whether the work of refining will be resumed again very soon. An attempt was made to refine sulphur at a bank in Colusa county, some time since, but the stock of good material was soon exhausted and the works were closed up.

**ANGORA GOATS.**—Mr. Peltier, of Mulwala, Australia, who has bred pure Angora goats for several years, says they give more and richer milk, are more hardy and better able to stand the droughts and are not so easily injured by young grass as the common goat. He calls the Angora the "poor man's friend."

## USEFUL INFORMATION.

## Relief from Mosquitoes.

We some time since copied a paragraph which has gone the rounds of the press generally, to the effect that occasionally burning a little camphor in a room is a sure relief from mosquitoes. The *Hearth and Home* also published the same with a request that if any of their correspondents should make the experiment and find it successful they would communicate the fact. That request brought the following reply:—"I have been a sufferer—I am no longer one—at least so far as mosquitoes are interested. I followed your recipe word for word, and my chamber is no longer the reception room for these tormentors. I let my window remain open with perfect safety now. Twice during the seven days, since July 2d, I have burned camphor as directed, and although I left the windows and doors open, and could hear the distant drowsy hum of my oney just without my fortress, it was thus far and no further with them. Since then I have experimented with them. Prisoning some twenty or more under a glass case, I puffed a small cloud upon them. In three minutes after a frantic struggle to escape what must have been to them a deadly npas, they perished miserably."

## Concentrated Vegetables.

The general attention that has of late years been paid to the preservation and concentration of articles of food, continues to issue in new and occasionally valuable processes—though many of those put forth turn out on trial to be either wholly useless or quite impracticable save in the hands of such as have been specially trained; to their management, in which category the following process for the concentration of vegetables is destined to fall, has yet to be determined. The aim is to put the solid portions of vegetables in such a shape that they may be readily preserved, and easily prepared for use when wanted, at the same time reducing the bulk and preserving their flavor. The way this is attempted in the case of potatoes will serve for illustration: After being thoroughly washed, the potatoes are boiled until done and their skins removed. The potato is then divided into fine vermicular particles by mechanical means, and while in this state the water is driven off by exposed heat. The material is left in a condition much resembling rice, and in this shape it is ground to flour if desired. The extract of potato prepared in this way can be used for making soups and other dishes; and by adding boiling water, a dish in every way resembling mashed potatoes, cooked directly from potatoes in the ordinary manner, is obtained, but, it is said, of superior flavor and quality.

## To Tan Small Skins.

Place the hide on a smooth, round sided-slah, made for the purpose, with two legs in one end, and the other end resting on the ground, drive a nail in the upper end to hold the skin from slipping while fleshing. Scrape off all the flesh with a blunt knife, being careful not to tear the hide. Then take the brains of the squirrel and work them thoroughly into the skin; this renders the skin pliable. Then to preserve the skin from the ravages of insects, scatter on some powdered alum and a little saltpetre. Let dry; then stretch and work it until pliable as may be desired. The above is acknowledged to be a very good recipe for tanning all kinds of fur, although there may be better ones in use.—*Cor. Rural New Yorker.*

**THE FIRST UMBRELLA.**—History records that the French were the first to carry umbrellas. Their first appearance in England was greeted with ridicule, and the custom of carrying your shelter with you derided as a piece of French effeminacy. The few who first summoned courage to carry umbrellas through the streets of an English city were followed by jeering boys.

**How to KEEP COOL.**—During oppressively warm weather, it may prove a relief to remember that water applied to the wrists and temples and allowed to evaporate will cool the blood surprisingly. A sponge bath of tepid water before retiring will frequently insure a comfortable sleep in a hot night.

## Preserving Grapes.

As the season for grapes is rapidly approaching, the following may be of importance to the cultivators and consumers of this favorite fruit:

While grapes may be grown in such profusion and with so little labor, it is a remarkable fact that a supply for every household in the country is not produced, not only in the regular season of them, but to last till spring. There is no trouble in keeping grapes through the winter as fresh as when first gathered. In seasons when other fruit is scarce, no greater luxury can be enjoyed than a dish of fresh grapes in winter. In gathering grapes to be kept fresh they should be allowed to hang on the vines until they are fully ripe, and then gathered with care, to avoid bruising. The fairest bunches should be chosen to put away, and with a pair of small scissors all defective and bruised berries should be cut off. They should be then put in boxes well ventilated, and remain for a few days, when they should be packed in boxes holding six or eight pounds each, first sprinkling the bottom with a layer of mahogany sawdust, or, what is better, turning chips, then a layer of grapes, and then sawdust alternating to the top. It is not important that the box be tight; it is better that it should not be. These should be put in the coolest place in the house, where the air is dry.

## Polish for Leather.

A good polish for restoring leather tops dashes, etc., is made of two parts of good glue soaked in tepid water until it is thoroughly softened, then add three parts of crown soap dissolved in warm water, then add five gills of water and two gills of brandy or common spirits, rubbing it until it becomes smooth, stir this into the mass and afterward stir in two parts of wheat flour mixed smooth in cold water. The mixture is then put over a moderate fire and allowed to steam off a little but not to boil, stirring it well while over the fire.

It can be used immediately or made up into small cakes which can be dissolved at any time in a little water or beer. It can be put on with a brush, a thin coat only being required, and afterward rubbing it with a linen or silk cloth. This not only restores the color but also adds to the durability of the leather.—*Carriage Journal.*

**A PERPETUAL CANDLE.**—The perpetual candle is the name of a useful contrivance which has lately been introduced in this country from Russia. It consists of a small tube, within which is placed a close fitting wick, soaked with kerosene. This tube is screwed into a candlestick, and fits inside another tube made of white china, and resembling closely a candle in external appearance, the whole having the look of an ordinary candle and candlestick. By heating the top of the brass tube the kerosene-soaked wick generates a gas and gives a fine blaze through a number of small apertures in the end of the tube. By this simple and ingenious arrangement, it is said, a good light is furnished at a cost of one cent for five hours. Besides the point of economy, it is thought that the use of kerosene in this manner will be entirely free from danger of explosion.

**PASSAGE OF SOUND THROUGH THE ATMOSPHERE.**—The whistle of a locomotive is heard 3,300 yards through the air; the noise of a railroad train, 2,800 yards; the report of a musket and the bark of a dog, 1,800 yards; an orchestra or the roll of a drum, 1,600 yards; the human voice reaches to the distance of 1,000 yards; the croaking of frogs, 900 yards; the chirping of crickets, 800 yards. Distinct speaking is heard in the air from below to a distance of 600 yards; from above it is only understood to a range of 100 yards downward. It has been ascertained that an echo is well reflected from the water only when the voice comes from an elevation.

**A USEFUL PRECAUTION.**—There is a very simple process by which muslins used for ladies and children's dresses can be protected from catching fire. Dissolve a small piece of alum in the water in which muslins are rinsed. When dry, if a light be put to them, they will smoulder away slowly, but not break out into a blaze. And this, so far from being serious to muslin, improves its appearance greatly.

**EVERYTHING useful or necessary is the cheapest.** Walking is the most wholesome exercise; water, the best drink; and plain food the most nourishing and healthy diet. Even in knowledge the most useful is the easiest acquired.

## GOOD HEALTH.

## More About Cundurango.—The Other Side.

In our issue two weeks ago we gave the history of the introduction and alleged virtues of the Peruvian plant, known as *cundurango*, and it is perhaps but proper that we should mention in this connection, what we did not notice, until that article went to press, that many of our medical men do not agree with Dr. Bliss and others in their appreciation of this new cancer specific. Dr. Nichols of the Boston *Journal of Chemistry*, a high medical authority, remarks that "A great noise has been made regarding it [cundurango] by correspondents of newspapers, which we suppose is a new way of advertising a nostrum which it is in contemplation" to put on the track "as a sovereign cure-all for cancer and other malignant affection." The Doctor thinks Mr. Colfax is giving the matter undue notoriety by alleging that it has "cured his mother-in-law of cancer." This, adds the Doctor, sounds very absurd to intelligent physicians, who know that cancer is not a local trouble, but a disease affecting the system generally, and of a most malignant nature. He advises his readers "not to invest very largely in the cundurango, or any other nostrum claiming to have extraordinary virtues."

Dr. Antisell, of Washington, is also lacking in faith in the alleged specific. He has subjected the plant to chemical examination, and fails to find in it any unusual characteristics. He is inclined to class it among the "aromatic bitters," and states that what little medicinal virtues it has resides in the bark.

The "profession," with its usual caution, will of course discourage the very general introduction of this specific, until its characteristics and effects upon the human system have become more fully known, under the administration of careful and intelligent physicians. This perhaps is wise and proper; but judging from well authenticated reports, there seems to have been at least an apparent demonstration of its virtues, of sufficient significance to warrant a more careful and thorough experimentation with it.

## A Rival Cancer Cure.

The Boston *Herald* indorses the reputation of a physician of forty years' standing who says he has used cundurango in the country of its growth to cure cancer, and found it an efficient alternative, but not always certain. On the other hand, he used red clover tops in ten different cases without a single failure. This is valuable information, if its results shall prove to be as uniformly successful as this physician claims to have found them. At all events, clover is so abundant and inexpensive that it can be brought within everybody's reach. The manner of using is to make an infusion of the tops, dry or green, and drink freely, making also external applications to the affected parts. The paper above named comes to the defense of its "Old physician of high standing" and his new cancer remedy as follows: "The use of red clover for several cutaneous disorders has been familiar for years, among the old women who doctor with herbs in an amateur way in the back country, but it should not be scorned on that account. Many a crone culls simples as effective as the most elaborate prescriptions of the pharmacopoeia."

**EATING.**—Every animal eats as much as it can procure, and as much as it can hold. A cow eats but to sleep, and sleeps but to eat; not content with eating all day long, "twice it slays the slain," and eats its dinner over again. A whale swallows ten millions of living shrimps at a draught; a nursing canary-bird eats its own bulk in a day; and a caterpillar eats five hundred times its own weight before it lies down to rise a butterfly. The mite and the maggot eat the very world in which they live; they nestle and build in their own roast beef; and the hyena, for want of better, eats himself. Yet the maggot has not the gout, and the whale is not subject to sciatica. Nor does Captain Lyon inform us that an Esquimaux is troubled with the toothache, dyspepsia, or hysteries, though he eats ten pounds of seal, and drinks a gallon of oil at a meal, and though his meal lasts as long as his meat. But if eating is to produce diseases, what disease would be absent from the carcasses of Captain Cochrane's Siberian friends, who eat forty pounds of meat with twenty of rice porridge at a sitting?

## Inherited Inebriation.

Dr. Brown, a well known English writer on insanity, says:

The drunkard not only enfeebles and weakens his own nervous system, but entails mental disease upon his family.

The author of an elaborate article in the eighth volume of the British *Psychological Journal* in describing a class of persons fond of intoxicating drinks, says:

They are offsprings of persons who have indulged in stimulants, or who have weakened the cerebral organizations by vicious habits.

Mr. Darwin says:

It is remarkable that all the diseases arising from drinking spirituous or fermented liquors are liable to become hereditary, even to the third generation, increasing, if the cause be continued, till the family become extinct.

Dr. Elum, a London physician, in a recent work upon Physical Degeneracy, writes of the effects of alcohol, as follows:

All this, fearful as it is, would be of trifling importance did the punishment descend only on the individual concerned and terminated there. Unfortunately this is not so, for there is no phase of humanity in which hereditary influence is so marked and characteristic as in this. The children unquestionably do suffer from the sins of the parent, even unto untold generations. And thus the evil spreads from the individual to the family, from family to community, and to the population at large.

## Treatment of Felons

In the early stages, during the first three days, the finger should be put into a hot water as can be borne, and the temperature gradually increased for thirty minutes, or until the pain subsides, then apply a cool compress; cold compresses should be kept upon the arm, to cool the circulation and prevent the morbid deposits from being carried to the finger. The immersion of the finger in hot water may be repeated when the intensity of the pain requires it. If this treatment is persevered in faithfully it will scatter it.

Should this fail and the swelling increase, hot poultices made of slippery elm, corn meal, bread and milk, or hops, may be applied, frequently changing them, which will not only relieve the pain, but bring the felon to a head. When it is opened tepid poultices should be applied for a few days; after the inflammation has subsided it should be dressed with cold compresses, or a creamed or oiled cloth, to keep the parts moist and afford protection; if the poulticing is continued too long, it will draw effete matter to the part, and prevent its healing. For general treatment, give an occasional vapor, hot sitz, or pack, as may be indicated.—*Dr. McCall.*

**A USEFUL RECIPE.**—Rub four parts by weight, of yolk of eggs, in a mortar with five parts of glycerine. This compound has the consistency of honey, is unctuous, like fatty substances, but is easily removed by water. Applied to the skin, it forms a varnish, which effectually prevents the action of air. It allays the itching in cutaneous actions. Is unalterable, and can be exposed to the air for an indefinite period.

**TRANSPLANTATION OF BONE.**—M. Philippeaux has made some experiments upon guinea-pigs tending to prove that bone taken from an animal may be transplanted upon another animal of the same species. M. Ollier had made similar experiments before, but they were made upon the same animal and grafted in the same opening wherefrom they had been taken. M. Vulpian says that an important condition of success depends upon the age of the animals.—*Gaz. Médicale.*

**CIDER FOR A COLD.**—Common sweet cider boiled down to one half, makes a most excellent syrup for coughs and colds for children—is pleasant to the taste, and will keep for over a year in a cool cellar. In recovering from an illness, the system has a craving for some pleasant acid drink. This is found in cider which is placed on the fire as soon as made, and allowed to boil, then cooled, put in casks, and kept in a cool cellar.

**A HINT TO CONSUMPTIVES.**—A physician of no little experience says he has known several consumptive patients cured by observing the following rules: Live temperately, avoid spirituous liquors, wear flannel next to the skin, take every morning half a pint of new milk, mixed with a wine-glassfull of expressed juice of green hoarhound.

**CHANGES IN IMMIGRATION.**—A few years since, Ireland was the great source of immigration into the United States; and later Germany took the lead; but the present prospects are that both those localities are about to give place to England in supplying future citizens to the great Republic.

In 1863, 116,301 Irish left their home for this country, and the same year 76,473 English and Scotch came over. In 1870, the figures were nearly reversed, for in that year, only 74,283 Irish left their homes for America, while the number of emigrating English and Scotch reached 123,228. The German immigration which by reason of the war declined from 65,752 to 48,396, will doubtless again advance to its former figures or higher, as soon as the imperial armies are reduced to their peace footing.

The cause of the activity of English emigration is undoubtedly referable to a more general recognition among that people of the advantages which await emigrants in the United States. Democratic tendencies in England are also producing greater affinities for free institutions than was formerly the case, and are fast wearing away the prejudice which has heretofore been so strong against our government that it was rarely that an Englishman became naturalized. Under the new condition of things we may expect a more general tendency to naturalization among our English cousins who came over to dwell with us.

**NOW AND THEN.**—At the Institute Fair of 1865 there were only 984 entries, while the entries at the present exhibition numbers 1,781—nearly double the former.

**BET SUGAR IN ILLINOIS** does not promise a very great success; the soil is not well adapted to the development of the saccharine property of the beet.

**A SCHOOL OF PAINTING AND SCULPTURE.** At University College, London, a wing is being built for schools of painting and sculpture, intended for both male and female artists.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANKS.

(Expressly for the Press.)

Every miner can acquire with a little practice and proper instruction, skill and knowledge, sufficient to determine the quality and value of the gold dust he is toiling daily to win from the earth. The skill can only be acquired by practice. The instruction, it will be my pleasure to impart.

The implements and materials for the approximate assay of gold dust and retorted amalgam are neither expensive, bulky or numerous. They can be purchased in San Francisco at moderate cost. The ingenious miner can improvise many of them, and to aid him in doing so, full and careful description will be given.

**A BLOWPIPE.**—The simple form in common use by jewelers answers every requirement.

**A SPIRIT LAMP.**—One of glass in which the wick tube does not screw down is best and safest.

**AN EVAPORATING DISH** about six inches in diameter. This will be found very convenient for prospecting, concentrating sulphurets, etc., much better than the horn spoon in common use.

**TWO SETS OF TOUCH NEEDLES**, one the alloy of which is silver, the other copper. These needles can be made by any handy person. Absolutely pure gold and silver are required.

My plan is to draw out copper wire through a wire plate with square holes, to about the size of the square point of a ten penny nail. This is cut into lengths of about two inches,—five of these constitute a set. I commence each set with pure gold, but only one is necessary, for pure gold is of course the standard of either.

I weigh out 10 grains of pure gold, melt it before the blowpipe in a cavity in a piece of charcoal, hammer it square and solder it to the end of one of the square wires. This requires some skill and an understanding of the nature of this kind of soldering, but any jeweler can do it from this description. When soldered, I file it down even with the sides of the wire and stamp on the wire near it 1,000, which represents pure gold. For the other end I make an alloy by weighing out very carefully nine grains of pure gold and one grain of pure silver; these are melted on charcoal, together—care being taken that sufficient heat is produced to render the alloy perfectly fluid—hammered square and soldered in the other end of the first needle. This is stamped 900. One needle being complete, the others are made in the same way as follows:

8 grains gold.	2 grains silver.	Stamped 800.
7 " " "	3 " " "	" 700
6 " " "	4 " " "	" 600
5 " " "	5 " " "	" 500
4 " " "	6 " " "	" 400
3 " " "	7 " " "	" 300
2 " " "	8 " " "	" 200
1 " " "	9 " " "	" 100

The second set is made in exactly the same way except that copper takes the place of silver in the alloy.

If you make these needles yourself you have the satisfaction of knowing that they are correct. The only source of error is the heating of the solder so hot that it melts the alloy, and by fusing with it a new and unknown alloy is formed. The alloy should be considerably larger than the needle so that it can be filed down, thus removing the solder from all parts except where the copper is joined to it.

**A TOUCH STONE.**—This is best purchased, but the black quartz stones found in the beds of some rivers and creeks, will answer the purpose if they will scratch glass, and acids have no effect upon them. A smooth face should be formed by grinding them down on a grindstone and finished by rubbing with oil and emery on a flat board, or other level surface. An ordinary oil stone gives them a good finish. They must be washed thoroughly with soap before being used to remove the oil used on grinding.

**CUPELS OF BONE ASH.**—These should be about .6 of an inch in diameter at the top, .5 at the bottom and about .4 thick. The hollow cup-like cavity should be about .1 of an inch deep. These are made with a brass mould which can be purchased in San Francisco, or what may be made of hard wood in an ordinary turning lathe.

**A SUPPORT FOR THE CUPELS.**—This is made of wire, one end of which is bent in a ring larger than the bottom of the cupel, and smaller than the top. The wire is fixed into a handle, the support may be

made of strong brass or copper wire, the end passed through a piece of clay pipe stem, to serve as a handle; but a much more elegant arrangement is to use a wire of platinum, soldered at the point of the ring with gold, (the best solder for platinum) the end of the wire is then fused into the end of a glass rod which being a perfect non-conductor, forms a most admirable handle. Such a support is not expensive, and is far its best.

**A BALANCE AND WEIGHTS.**—This, which must be accurate, is the most costly of any of the necessities. A good balance cannot be bought for much less than \$40, but a cheap substitute similar to the one described in Dr. Barstow's little book "Sulphurets,"\* can be furnished for a small sum. Such a balance will answer if well made for approximate assays.

For weights, I would recommend the gramme divided into 1,000 parts, but any other small weight will do for a unit; 10 grains divided into thousandths will be found convenient.

**A SMALL BRUSH**, called by artists and painters a "flat fitch." A portion of the handle should be cut off leaving it about four inches long.

**A COLD CHISEL** and a small flat piece of iron or steel to be used as an anvil.

**A MAGNET** for removing iron sand from gold dust.

**A PAIR OF PLIERS** may be made of a piece of tin or sheet brass folded once and filed into shape.

**A PAIR OF STRONG PINNERS.**

**A HAMMER.**

**A MAGNIFYING GLASS.**

**ONE-HALF DOZEN TEST TUBES** and a few dry cups.

**A COIN TEST.**—This is a small bottle with elongated stopper by means of which a small portion of acid may be lifted and placed upon the touch stones. A glass rod may be used instead of the above.

**HESSIAN CRUCIBLES**, triangular, about four inches high.

**WATCH GLASSES.**—Those with a small flat surface in the center answer best.

**A CHARCOAL SUPPORT.**—Best made by filing a piece of sheet brass into a three-pronged fork, the center tine of which is a little the longest. This is then fixed into a handle. It is used simply by sticking the points into the side of a piece of square charcoal upon which you lay the substance to be heated. A common table fork will answer.

**DISTILLED WATER.**—Melted snow, or rain water will be found sufficiently pure. The water of some mountain streams is free from chlorine which is the impurity that is objectionable. Any water from which no precipitate or milkiness results on adding solution of nitrate of silver, will answer the purpose.

**NITRIC ACID** which must also be free from chlorine and must stand the test given for distilled water.

**HYDROCHLORIC ACID.**

**AMMONIA.**

**TEST ACID.**—This acid made by mixing 98 parts pure nitric acid of a strength indicated by 37° Baumé, 2 part of pure hydrochloric acid of 21° Baumé, and 25 parts of distilled water.

**CLOSED TUBES.**—These are of glass about one-fourth of an inch inside diameter, made by cutting a glass tube of proper size into lengths of about three inches, and closing one end by melting the glass in the blow-pipe flame.

**LEAD FOIL** made by rolling out lead thin in a rolling mill. The lead must be so pure that if you cupel a square inch of it the button remaining on the cupel is scarcely visible even under a magnifying glass. It should contain no trace of gold.

**PURE SILVER** rolled out into thin sheets to be cut with scissors, or in a powder, for convenience of weighing.

\*Printed and sold at the SCIENTIFIC PRESS office.

**HEARTH AND HOME.**—In October last this popular journal passed into the hands of Messrs. Orange Judd & Co., of New York, the well known publishers of the American Agriculturist. It is a handsome sheet adapted to the wants of both adults and juveniles, and merits a prominent place in every household. It supplies very useful chapters for the garden and farm, and an important news sheet giving a valuable resume of the news of the week up to the moment of issue.

**MACHINERY.**—Agricultural implements etc., to the value of over \$27,000,000, was exported from England last year—more than half of the amount resulting from the sale of steam engines.

## Notes on Contributions to our Cabinet.\*

Nos. 525 and 526.—We have received two specimens of "Hat Rock," from Mr. Geo. Dietz, Superintendent of the "Eureka Silver Mining Co.," in British Columbia, about six miles from the town of Hope. The mine is just being opened and of the specimens referred to, one, No. 525 is from the surface cropping as the name "hat rock" implies, and the other, No. 526, is from the ledge eight feet below the surface. The rock shows a general water worn appearance, is covered with oxide of iron, and in some places crumbles easily under the pressure of the finger.

\*Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., adds much to the value of such specimens.

**LIVERPOOL COPPER REPORT.**—We learn from James Lewis & Sons' copper report for Aug. 1st, that during the previous month the copper market exhibited great activity until about the 24th, when the demand suddenly ceased, and the business since has been but trifling. On the 11th the English smelters advanced their quotations £2 per ton, and the present prices are £76 for cast and ingot, and £81 for strong sheet, but they have a difficulty in obtaining these prices. Sales of ore and regulus have been:

	Tons.	Per Unit.
July 11th.....208 Regulus. Chile, at Liverpool, 14s. 0d.		
" 19th.....19 " Battle Mt. " 14s. 0d.		
" 25th.....35 " Canadian " 14s. 0d.		

**GOLD.**—77s. 9d. per oz. standard.  
**SILVER.**—Has advanced to 50 11-16 per oz. standard. California sells at 5 1½; Mexican Dollars, of new die, for 4 11 per oz.

**QUICKSILVER.**—has further declined to £9 per bottle of 75 lbs.

**ANTIMONY.**—French Star £49 to £50 per ton.  
**LEAD.**—Has fallen to £17 15 - to £18 for English, and £17 7-6 to £17 10 - for Spanish.

**TIN.**—Market firm at £134 for Straits, and £100 to £118 for Peruvian.

"THE VISITORS' GUIDE AND CATALOGUE TO THE EIGHTH INDUSTRIAL FAIR" has made its appearance, and several of our cotemporaries have been led into the error of supposing that this is the first publication of the kind ever made in connection with the Exhibition of the Mechanics' Institute. The *Alta* of Tuesday corrects that error in the following words:—"Although to Mr. Price belongs the full credit of having again started the catalogue, we were in error in speaking of it yesterday as the first of its kind. Messrs. Dewey & Co., of the MINING AND SCIENTIFIC PRESS, in 1865, issued a very neat and comprehensive catalogue for the Fifth Industrial Exhibition."

## The Overland Monthly for September.

This original and improving magazine contains its usual variety of amusing and instructive articles. The first discusses the probability of the success of Capt. Hall's Arctic expedition, another treats of the Mormon problem under the heading of the "Mahomet of the West," and another, entitled "Shakes," is one of those characteristic California stories for which this periodical is noted. Several other prose articles and a few in poetry complete the series which can be read without the interruption of continued articles—a source of gratification to most readers of magazines. We notice that in future issues the enterprising publishers intend to occasionally illustrate one or more articles, and that only such places and articles will be illustrated as will have special interest for readers on both sides of the continent.

**ANTIDOTE FOR TOBACCO CHEWING.**—It is said that tobacco chewing propensities may be effectually eradicated by chewing gentian root, after meals, and swallowing the saliva.

**THE BARTLETT PEARS** received this week, prepaid, from C. W. Pomeroy, San José, are the best we have seen or tasted.

**HEAVY** land if reduced and pulverized, as it can be when completely dry, will not forget it in years.

**Combined Seeder and Cultivator.**

The machine, a representation of which is herewith shown, is known as "Gorham's Combined Broadcast Seeder and Cultivator." Many devices have been introduced to do the work performed by this machine; but all have more or less objectionable features, which it is difficult to surmount. Perhaps one of the greatest difficulties encountered is that of effecting a uniform sowing of the grain.

Any machine that has a continuous dropping orifice, or a multitude of separate and smaller ones, or those which open and shut, and with stirrers over them, must be defective, from the fact that it is impossible to measure through such orifices. Again, machines which have measuring cups that open and shut, are always liable to be choked with straw, or to fail, from the fact that the opening and closing may not always be uniform. Hence the grain is sown unequally, and want and waste ensue.

It is claimed by the inventor that this machine obviates this difficulty by adopting the following seeding device: A series of seed wheels or droppers is placed two feet apart, and attached to a shaft that runs through the center of the box. To each of the seed wheels five cups are attached; each wheel is enclosed by partitions on either side that are open at the bottom to admit the grain to the wheel. Now when the seed wheels revolve, the cups are drawn upward through the grain, each taking a given quantity which in passing around is poured on the beveled surfaces in front that deflect the seed into troughs on either side, where it runs in a continuous stream upon the scatterer below.

It will be readily understood by the above description that the essential principle is the measuring and pouring of the seed, and that this result is produced by a device that cannot cut or injure the seed in its passage to the ground.

The scatterer is a distinct fixture that receives the grain from the seed wheels, distributing it equally over the land; and yet being so open in its throat as to pass straw and other foul substances without clogging.

The quantity sown is regulated by different sized gears, placed at the end of the box, which give the seed wheels different motions. Grass and other small seeds are sown, by inserting a supplemental cup in the grain-cups, closing the grain orifice, leaving an orifice proportionally large for the smaller seeds, when the same series of gears are used to regulate the quantity per acre. Thus it is that the finest seeds as well as the coarsest grain are distributed with the greatest accuracy.

The cultivator attachment for this seeder is on the independent slip-tooth principle, with a new device, very simple and effective.

It will be seen by the accompanying illustration that the cultivator is raised in two sections, thus avoiding the necessity of a very heavy lift, as when all the teeth are raised at once.

The cultivators can almost instantly be detached if occasion requires. The weight of the 6-foot machine is 500 lbs. only, and is banded easily by an ordinary team in any kind of soil. This is the smallest size; but there are three sizes larger. It sows equally well in windy or still weather.

One of these machines may be seen in the Agricultural department at the Pavilion. It is now for the first time introduced to the farmers of California. It has been largely introduced into Idaho, where we understand it is giving the fullest satisfaction. We have seen numerous testimonials to that effect.

Betts, Brown & Co., are the owners of the patent right for all the Pacific States and Territories except Idaho and Montana. W. H. Pope, General Agent.

**An Improved Bearing for the Wheels of Roller Skates.**

Iron and steel have been tried as a bushing or bearing for the wheels of roller skates, and have been found wanting, from the fact that both these materials wear quite irregularly, and, moreover, require the use of oil, for lubricating, which is found very inconvenient, from the fact that it often seriously defaces clothing, etc., with which it comes in contact.

To remedy these defects, ivory has been substituted, which requires very little oil, is always clean and without stain, runs easier than metal, and is quite as durable. Sets have been used in this city, daily, for three months, without deterioration, the wear being even and smooth. On the ordinary skates, when the body is thrown forward, the wheels are very liable, when worn, to hold back and throw the skater. This difficulty is done away with in the use of ivory, for there is less friction, and consequently an easier motion is produced.

By the use of skates provided with these wheels a greater speed can be attained, and with less fatigue, than is usual; and by their smoothness of action the feats usually performed by more accomplished skaters can be done with greater facility and

**GORHAM'S COMBINED BROADCAST SEEDER AND CULTIVATOR.**

grace. Rollers with ivory bearings are rapidly being adopted by experts and professional skaters. A patent for this in-

**COOK'S IMPROVED SKATE ROLLER.**

vention has been obtained through the agency connected with this office. The inventors, Messrs. S. P. & H. B. Cook, of this city, are ready to furnish the rollers, with their patent ivory bushing, to makers or users of skates.

For further particulars address M. Cook & Son, Box 1124 San Francisco.

A TUNNEL is to be dug under Lake Erie, a mile and a half from shore for the purpose of supplying the city of Cleveland, Ohio, with pure water, after the manner of Chicago.

QUERIES FOR MECHANICS.—In our article under this head, Aug. 12th, we should have printed the word "dogs" instead of "chucks."

**Notes at the S. F. Mechanics' Institute Fair.**

[In these articles we have room only to notice briefly such articles as come specially under our observation. More replete descriptions of the most interesting and instructive exhibits will be given in the Press in our greater leisure hereafter. No classified catalogue being published we do not in this number give complete notices in any particular department.]

KNOWLES' PATENT PUMPS are represented by A. L. Fish, S. F. agent. The display is a good one, and is located prominently at the entrance to the machinery department. The large pump works well and is highly spoken of by practical men. It was illustrated in our issue of July 22d.

HOOKE'S STEAM PUMP, a California invention, patented by the SCIENTIFIC PRESS agency, we believe possesses superior merits, likely to place it in the front ranks of the hydraulic inventions of the day. It is compact, simple and apparently of durable and cheap construction. Mr. Hooker manufactures his pumps in his own shop, in this city and, in a measure, with his own digits, and although his exhibit is the modest one of two small sized pumps, it will be difficult to find many home in-

RAMIE.—Messrs. Finch & Meek exhibit a fine specimen of the Ramie (or Chinese grass) plant, some six feet high, said to be about the average size in their field in San Lorenzo, Alameda Co. They also exhibit a machine for separating the fibre from the woody portion of the stalks or branches of the plant. It is one of the only seven machines yet made in the U. S. A series of corrugated rollers form the operative part of the apparatus, which seems to do its work effectually. The exhibitors do not intend to harvest their crop, but will layer the plants this season to produce cuttings for cultivating a 200-acre field they are about purchasing in Los Angeles. Samples of cloth are shown from a new manufactory built at Calhoun Falls, N. Y.

A PATENT GOVERNOR exhibited by J. Hendy, shows a simple and not expensive construction with the apparent merit of sensitive action on the steam valve and a motion to stop the engine in case of leakage. Invented and perfected by San Francisco mechanics and patented by Dewey & Co.'s agency.

A STEAM WASHING MACHINE just patented through our agency, exhibited by H. E. Lea, of Half-Moon Bay, will be described and perhaps illustrated by us at another time. J. Burnap, 425 Davis street, S. F., is the agent for the inventor.

FINE STATIONERY is displayed by John G. Hodge & Co. They are agents for Carey's fine ledger, letter and flatcap writing papers, the best reputed of any manufactured in the Union. Also for Faber's imported pencils.

QUARTZ MILL.—Geo. A. Lloyd's improvements consist in attaching springs to the upper part of the stamp stems which greatly increase the force and number of the blows, thereby creating rapid work. Mr. L. has quite a number of other interesting patented inventions including a reversible door butt and spring combined; egg and fruit carrier; gopher trap; improved anchor; easy threading needle.

ADJUSTABLE CAM FOR QUARTZ MILLS; IMPROVED DUMPING CARS; SHUTE FOR QUARTZ MILLS, all invented and patented by James M. Thompson, of Mammoth mills, Jamison Creek, Plumas county.

ATTACHMENT OF WEIGHTS TO WINDOW SASH by the employment of thin strips of steel fastened by new devised clamps; by John Marquis, architect, S. F.

PRES. HALLIDIE'S PATENT ENDLESS WIRE ROPE WAY is fully illustrated in the Press Feb. 18, 1871. It is operated with his improved clutch pulley patented through our agency. This railway is claimed to be an improvement on the English system of elevated railways now successfully introduced and in practical operation at Eberhardt, White Pine, Nev. Mr. Hallidie's railway extends throughout the machinery department, and like his suspension bridge in the main hall of the Pavilion, is one of the leading features of the exhibition.

ROLLER SKATE.—John L. Boone displays seven pairs of different sizes of his patent C-Spring Skates, already illustrated in the Press. As one of the most original California inventions it attracts much attention and many favorable remarks.

CALIFORNIA INVENTIONS.—Among the most novel inventions exhibited by our own Pacific Coast inventors and patentees, we would briefly call notice to the following either specially interesting or worth examining. A number of them as well as others on exhibition will be described at length when our columns are less taxed, or illustrations provided:—

THOMAS HILL'S STEAM RAM and projectile for war steamers—a beautiful and thoroughly constructed operative model. Illustrated in the SCIENTIFIC PRESS in 1870. Mr. H. has various other inventions each worthy of a fortune.

[Continued on page 124.]

## DOMESTIC ECONOMY.

### The Art of Dining.

The mind has its diseases as well as the body, and I think vegetarianism is one of them. It is by practical experience that we learn what food is proper for us, and not by chemical analysis. Everything we eat with the exception of salt, can be turned into charcoal; yet who can live on charcoal? An experiment has been made by the great chemist, Magendie. He fed geese on gum only and they died on the 16th day; he fed some on starch only, and they died on the 24th day; he fed the others on the two kinds mixed together and they fattened instead of dying. So we must vary our food as much as possible in order to supply the waste of every part of our system. In cooking vegetables, green vegetables, such as cabbage, spinach, etc., they should be put into water at its first boiling, with salt. Dry vegetables, like beans, peas, etc., should be put over the fire in cold, soft water, after having been soaked in luke-warm water—beans for twenty-four hours. Potatoes should be steamed but never boiled. Steam with the skins on. Bear in mind that a potato must never be peeled, as the part immediately under the skin contains much nutriment. Cut out the eyes or germs in any; if young and tender, the skin can be taken off with a scrubbing brush; if old, scrape the skin off and then roast them. In selecting the potato, remember the smaller the eye the better the potato. By cutting a piece from the thickest end, you can tell whether they are sound. They must be either white or pink, according to the kind. Always select beans without spots. Milk and eggs partake of the nature of animal as well as vegetable food. Fish is less nutritious than meat, containing only 20 per cent. of nutritious matter, but ought to be partaken of at least twice a week. It contains more phosphoric matter than any other food, and is very good to supply the waste of our system, especially of the brain. The brain of an idiot contains about one per cent. of phosphoric matter, while that of persons of sound intellect from two to two and a half per cent. The brain of a maniac contains three and a half per cent. We need not fear, however, of losing our senses from eating too much fish. It supplies the waste, but does not augment the proportion of the "phosphoric matter." The chemistry of the matter might, perhaps, be stated with more precision. For instance, instead of saying that everything we eat might be turned into charcoal, it would be more accurate to say that carbon, being the one solid of the four organic elements, the others may be driven off by heat, leaving the carbon behind in the form of charcoal.—*Prof. Blot.*

### How to Make Chocolate.

Take an ounce of chocolate for each person; scrape it and boil it about five minutes with about four tablespoonsful of water. When smooth, add about a pint of new milk; let it boil, stirring it well. Buttered toast is the proper accompaniment of chocolate, or light cake, made thus: Half a cupful of butter; one egg; two spoonfuls of cream of tartar, stirred with the butter and egg to a foam, one small cupful of sour milk added to this; three cupfuls the same size, of flour, sifted and well beaten into the liquid; and one small spoonful of soda, dissolved in hot water, and mixed in the cake just before putting it in the oven, which must be hot enough to bake it in ten minutes. Bake in narrow cake-pans, filling them three inches deep.

**HOW TO WHITEN FLANNEL.**—Flannel which has become yellow by age may be restored to its original whiteness by the solution of one and a half pounds of white Marseilles soap in 50 pounds of soft water to which is added two-thirds of an ounce of spirit of sal-ammonia and the whole thoroughly mixed. The flannel is to be immersed in this solution and well agitated, and afterwards thoroughly washed off in pure water.

The same result may also be obtained, still more quickly, by immersing the flannel for an hour in a dilute solution of acid sulphate, and therein dilute hydrochloric acid in the proportion of one part of acid to fifty of water. The vessel is then to be covered over and allowed to remain for a quarter of an hour, when the articles are to be removed and thoroughly washed.

### How to Make Coffee.

Professor Blot says: Grind the coffee, rather fine than otherwise. I use a coffee pot with a filter. You can get them at any tin store. Mixed coffee is best. I prefer a mixture of Java, Mocha and Maracaibo. Soft or spring water is best. Proportions, one quart of water to three ounces of coffee. Of course it can be made stronger or weaker. Four teaspoonsful make a quart of very good coffee for breakfast, but it is too strong for children.

In selecting a filter, or "coffee higgins," choose one with a bottom of silvered gauze, instead of perforated tin, as the perforated bottom lets the finely-ground coffee through. Good coffee cannot be made in what is wrongly called a coffee pot, which has no filter, and is much like a tea pot. Such a utensil requires the coffee to be boiled, which ruins it, leaving a bitter taste, and scuds all the aroma to the attic.

When the water is boiling hot, put the coffee in the filter, and pour the water over it, and the coffee is made. If the water does not pass through fast enough, set the kettle on the fire again until the water in it boils, when pour it on again. If all the strength is not extracted at the first making, repeat the operation when needed. The coffee may be dark, even black, when strong, but it must be clear. Each kind of coffee must be roasted separately, and it is better to roast it a day or two before using.

### Stewed Beef.

Housewives who are in a habit of using only steaks and roasts make a great mistake. A capacity dish may be made out of the "chuck" as the hutchers call it, or the neck when well prepared. Select a piece of meat as large as the demand of your table may require, wash it well to remove all the blood or soil from the outside, have your dinner pot perfectly clean, salt and pepper the meat well, lay it in the bottom and cover it with water; boil it from two to three hours or till it is thoroughly tender; add half an onion, a sprinkle of sage, thyme or summer savory.

If the meat is fat, let the water all stew out a half an hour before it is put on the table, and when your meat is browned well on the lower side in the gravy, turn it over and brown the other side. When ready, take it up, add a little flour thickening to the gravy, or if you have a dredge box shake the flour into the hot gravy and brown it, then add boiling water and you will have a dish equal to and to my mind superior to the common roast beef upon boarding house tables.

Care must be used to turn it; and equally necessary is good judgment in having it thoroughly well cooked.

**A COOLING BEVERAGE FOR SUMMER.**—Hard, hot work in the fields produces thirst, and we give a recipe to make a cool, healthy beverage for the harvester:

Put two gallons of cold water into a pot upon the fire; add to it two ounces of good ginger bruised, and two pounds of white or brown sugar. Let this come to a boil, and continue boiling for about half an hour. Then skim the liquor and pour into a jar or tub, along with one sliced lemon and a half an ounce of cream tartar. When nearly cold put in a teaspoonful of yeast, to cause the whole to work. The beer is now made; and after it has worked for two days, strain it and bottle for use. Tie down the corks firmly.

**HOW TO CLEAN OSTRICH FEATHERS.**—White ones, if washed in warm soap suds, dried in the sun on a towel and then well shaken out, will look as well as new, except they will want the beautiful curl, which even at first disappears the first damp day. At first, the feather will have a most discouraging appearance, and a novice is apt to think it perfectly spoiled, but the hot sun, or, failing that, a good fire, never fails to restore its pristine glory.

**TO PREPARE LIVER.**—When to be roasted whole soak three hours in cold water; when to be boiled, wash only; when to be cooked in slices, have water with a little salt on the fire; as soon as it boils throw the liver in for about five minutes, then take it out and drain it.

**TO PRESERVE FRUIT FRESH.** beat well together equal measures of honey and spring water in an earthen vessel; put in your apricots, plums and peaches, freshly gathered; cover closely, and they will keep fresh for a year. When taken out for use, they must be rinsed in cold water.

### Domestic Receipts.

**TO PREPARE BEEF A LA MODE.**—Procure a round of beef, weighing ten or twelve pounds. Remove the bone, and place the round in a deep earthenware bowl. Mix in a vessel two equal parts—say a teaspoonful—of salt, ground allspice, and ground black pepper. Rub the beef well on both sides with half of this mixture, then pour over it a pint of vinegar, and set away until the following morning, when you will use the remainder of the salt and spice, turning the beef so that the part that was under before, shall now be on top. Set away for another night. The second day it will be ready to cook. Before placing in the stove, make holes about an inch deep on both sides of the beef, and fill it with chopped onions. Fill the place left by the bone, with a dressing of bread crumbe and herbs, and bake in the vinegar. This is a most excellent dish when warm, and when cold is very nice for persons who have delicate appetites, or invalids who have little relish for meats.

**TO KEEP TOMATOES FOR WINTER USE.**—By the following method we may have tomatoes all the year round, which can scarcely be distinguished from those picked fresh from the vine: Dissolve a teaspoonful of salt in a gallon of water. Pick ripe tomatoes, but not over-ripe, leaving a little of the stem on. The tomatoes must be kept well covered with the brine, and they will keep till spring or longer.

**POTTED TONGUE.**—Remove the rind of the tongue, cut and pound it in a mortar as fine as possible with the butter, and the spices beaten fine. When perfectly pounded, and the spice well hleuded with the meat, press it into small potted pans, and pour clarified butter over the top. A little roast veal added to the potted tongue is an improvement.

**MILDEWEED LINEN** may be restored by soaping the spots, and, while wet, covering them with fine chalk, scraped to powder and well rubbed in.

### Mechanical Hints.

**POLISHING.**—The beauty of cabinet work depends upon the care with which it is finished; some clean off by scraping and rubbing with glass paper; this should be done in all cases, but it is not enough, particularly where the grain is anyway soft; a good glass paper is also essential; a polish should then be added. But unless the varnish for cabinet work be very clear and bright, it will give a dingy shade to all light colored woods; this should therefore be a previous care.

**THE FRENCH METHOD OF POLISHING.**—With a piece of pumice stone and water, pass regularly over the work with the grain, until the rising of the grain is down; then with powdered tripoli and boiled linseed oil polish the work to a bright face; this will be a very superior polish, but it requires considerable time.

**CHEAP OIL POLISH.**—The cheapest and most simple oil polish is, first, having well cleared the work, to oil the article with linseed oil, when by oiling and rubbing for a short time a bright gloss will be produced, and the natural color of the wood will show to much advantage. When it is required to darken the color, alkanet root, dragon's blood, or other coloring matters which dissolve in oil, slightly heated, are mixed with the above.

**TO POLISH IVORY.**—If ivory be polished with putty and water, by means of a rubber made of old hat, it will in a short time produce a fine gloss.

**TO POLISH ANY WORK OF PEARL.**—Go over it with pumice stone, finely powdered, (first washed to separate the impurities and dirt,) with which you may polish it very smooth; then apply putty powder as directed for ivory, and it will produce a fine gloss and a good color.

**TO POLISH TORTOISE SHELL OR HORN.**—Having scraped your work perfectly smooth and level, rub it with very fine sand paper or Dutch rushes; repeat the rubbing with a bit of felt dipped in very finely powdered charcoal with water, and lastly with rotten stone or putty powder; and finish with a piece of soft wash leather, dampod with a little sweet oil.

**FRENCH POLISHING.**—All polishes are used much in the same way. If your work be porous, or the grain coarse, it will be necessary, previous to polishing, to give it a coat of clear size previous to your commencing with the polish; and when dry, gently go over it with very fine glass paper; the glass will fill up the pores and prevent the waste of the polish by being absorbed into the wood, and he also saving of considerable time in the operation.

## LIFE THOUGHTS.

Above all things reverence thyself.—*Pythagoras.*

Advise not what is most pleasant, but what is best.—*Solon.*

ARROGANCE is the obstruction of wisdom. *Bion.*

AVARICE and vanity are the principal elements of all evil.—*Timon.*

A BLUSH is the complexion of virtue.—*Theophrastus and Diogenes.*

AN honorable death is better than an inglorious life.—*Socrates.*

ALL things should be common between friends; our friend is another self.—*Pythagoras.*

A GOOD man cares not for reproach of evil men.—*Democritus.*

A JUST man ought to be esteemed in preference to a relation.—*Antisthenes.*

A MAN ought to be good, or to seem so.—*Democritus.*

A STATUE stands firm on its base, a virtuous man on firm resolutions.—*Socrates.*

A MAN must not only live to eat and drink, but to use his life for the attainment of happiness.—*Zeno.*

An orator without judgment, is a horse without a bridle.—*Theophrastus.*

As the gods are consummately happy, the nearer a man approacheth to a similitude with them, the happier and better he is.—*Socrates.*

A WISE man is not governed by the laws and ordinances of men, but is governed by the rule of virtue.—*Antisthenes.*

As gangrenes are the most dangerous of bodily wounds, so insatiable avarice is the worst disease of the mind.—*Democritus.*

### Honest Words for an Earnest Man.

Religion does not altogether consist of devotional exercises, but as well, of daily work. We get a wrong idea of Christianity when we reduce it all to songs and sermons, to prayers, solemn faces, and ecclesiastical paraphernalia. It is not especially for Sabbaths and sanctuaries, but also for week days, for shops, for homes, for mills, for stores, for streets and fields. Religion is largely an out-door institution. Its Author was born, baptized, transfigured, and crucified under no roof but the sky. It means diligence in business, serving the Lord in common vocation and every day relations, as well as in consecrated syllables on set occasions.

Jesus was more sublimely great, standing unknown at the carpenter's bench in Nazareth, with an apron on, than if he had been surpliced as a priest in the temple, or arrayed in robes of royalty on Pilate's throne. He was greater with an adze in his hand than a crown on his head.

Christianity allows no aversion toward the mechanic. It gives him an honorable position. It invites him to its home and visits him in his. Yet how many rich young ladies who would scorn to associate with the sons and daughters of our workmen! The matrimonial problems that busy their brains involve such fractions as lawyers, physicians, large salaried preachers, wholesale merchants, millionaires, and gentlemen of leisure. It would be ridiculous, they think to throw themselves away on mechanics.

Of course society has its affinities, and that is well. Education grants it. Refinement and culture seek their level. But we dig down for gold. Too often dissipated dandyism is petted and honored, while intelligent labor is denied a place. The difference between building houses and selling is not so great that one should be considered contemptible and the other illustrious. Really, as a business, it makes but little difference whether a man mends clothes, bones, pens, houses, laws or morals. Work is work and nothing less; man is man and nothing more.—*Alexander Clark.*

Reprove mildly and sweetly, in the calmest manner, in the gentlest terms; not hastily or fiercely, nor with sour looks, or in bitter language; for these ways do beget all the evil, and hinder the best effects of reproof. They do certainly inflame and disturb the person reproved.

The intoxication of anger, like that of the grape, shows us to others, but hides us from ourselves.

To be ever active in laudable pursuits is the distinguishing characteristic of a man of merit.

CINCINNATI, O. CHICAGO, ILL. ST. LOUIS, MO.  
CLEVELAND, O. LOUISVILLE, KY.

Established 1846.

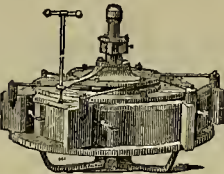

Claims for our Safes and Locks are:

- 1st—They have never been Destroyed by Fire.
- 2d—They have never been Robbed by Burglars.
- 3d—They are Fire, Damp and Burglar Proof.
- 4th—They are Superior in Finish to any Safe made
- 5th—Our Seven varieties of Combination Locks sur-  
pass any Locks made in point of Finish, Security and  
Simplicity.
- 6th—Our Locks have stood a Nine Days' Trial by ex-  
perts without being opened.
- 7th—We will put from \$1,000 to \$10,000 behind them.
- 8th—Our Safes and Locks have ALWAYS taken the  
Gold Medals at all Expositions.
- 9th—Our Safes combine some 26 Patent Improve-  
ments, and consequently possess Superior Advantages,  
in point of Security, to any Safe made.

AN INSPECTION WILL PROVE  
the above assertions.

J. R. CARNAHAN, GENERAL AGENT, will remain in  
San Francisco until September 1st. Office with CON-  
ROY & O'CONNOR, Bankers, Merchants, Jewelers,  
etc., are cordially invited to call. mail-6m

**SULPHURET SAVING MACHINE**, by C. C. Coleman of No. 216 3d st., S. F. A promising California mining invention recently described by us.

**IRON WHEEL BARROW**.—A handy article patented by Wm. McKibbin, one of our best known mechanics.

**THE LAWN SPRINKLER**—an original idea by Mr. Anderson, engineer, Tubbs' rope factory. Just the thing for this dry country. Illustrated by us recently.

**ANTI-SCALE COMPOUND**, an important remedy which should be generally used by our steam boiler owners. By Rickard and Durden.

**SWETT'S WINDOW FASTENER**, which locks the sash and prevents it from rattling. A cheap and simple article.

**WHITINO'S WINDOW FASTENER**.—A very substantial and convenient arrangement for moving the sash to any point and fastening it against burglars.

A **HAY RAKE**, which has been tested and praised by practical farmers, is manufactured in S. F. by the patentee, Olpha Bonney; we recommend its liberal introduction.

**The Pacific Rural Press** is meeting with Popular Success. New correspondents are coming to its aid and its patrons are increasing from various sections at home and abroad. Testimonials of the great value of its timely and fresh information are daily received, and we now know that we can and shall publish and maintain a first-class agricultural journal of great profit to every reader and of essential benefit and importance to the community of the Pacific Coast. *April, 1870.*

#### Our Printed Mail List.

Subscribers will notice that the figures found on the right of the pasted slips, represent the date to which they have paid. For instance, 21st/70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4/17/71, that he has paid to the 4th of January, 1871; 4/17/71, to the 4th of July, 1871. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction. Please notify us if you are not properly credited within two weeks after paying.

#### Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

W. H. MURRAY—General Traveling Agent.  
TALBOT P. POWERS—Solano and neighboring Counties.  
I. N. HOAG—Sacramento, General Agent.  
F. M. SHAW—San Diego.  
T. W. DRULLARD—California.  
M. W. LEVY—Denver, Colorado.  
M. B. STARR—Pacific Coast.  
THOMAS FOSTER—California.  
WM. J. CLARK—California.  
JOSEPH DIMMICK—California.  
E. P. HICKS—California and Oregon.  
A. O. KNOX, City Soliciting and Collecting Agent.

COPIES WANTED OF THE SCIENTIFIC PRESS OF JANUARY 7, 1871. We will pay 25 cents per copy, at this office, and also feel obliged to the sender.

**PATENT BROKERS**.—Inventors having valuable patents and needing reliable assistance in selling them should consult WEBSTER & CO., No. 17, New Montgomery street, under the Grand Hotel, San Francisco.

**Opera Glasses, Pebble Spectacles, and Eyeglasses**, in great variety, wholesale and retail. C. MULLER, Optician, 205 Montgomery street, Russ Block, San Francisco. 7v23-3m

**CONTINENTAL Life Insurance Co.**, 302 Montgomery street, corner of Pine.

#### Fair Samples.

During the Autumn Fair Season it is the purpose of the proprietors to bring the attention of every person engaged in the line of industries represented by this journal, to the personal benefit to be gained by its patronage and regular reading. We are not only determined to print a superior paper, but are bound that people shall know it, see it, and learn its power of self-elevation and practical benefit, by experience.

To accomplish this we have concluded to print (perhaps weekly) during the Fair season, many extra papers as fair sample copies of the PRESS for gratuitous and judicious circulation amongst the very best class of citizens—i. e., the steady, industrial, intelligent and producing population. By this liberal means our regular circulation will be greatly extended, and the different individuals who will receive and critically examine the paper and its entire contents will aggregate an immense number during the next three months.

#### GOOD HINTS ABOUT ADVERTISING!

Be Careful of your Seed! Sow it in Good Ground!

If you have goods to sell to farmers, it will pay you better to advertise in a farming paper, read and preserved by 10,000 intelligent farmers, than in miscellaneous daily or weekly journals, with 20,000 readers, comprising only 1,000 farmers. A mining journal in California with 10,000 readers reaches more miners than any other ten papers in the Union.

Purchasers are more likely to look for information in the advertising columns of a paper devoted to their special interests, than elsewhere, when ready to buy. Some will not read advertisements upon any other occasion.

Weekly journals are read most leisurely and carefully, and at a time when the subscriber is most favorably inclined to examine advertisements. The newspaper most specially representing your particular branch of industry is usually best entitled to your patronage, and the most profitable medium you can employ.

Advertisements appearing in a handsomely printed journal of established good character are more effective and beneficial to permanent dealers than when inserted in a shabby sheet of indifferent reputation.

Advertising in cheap priced mediums (of limited circulation) is like buying goods at retail when you could as well take them at wholesale.

Information imparted to a list of superior and intelligent and active and industrious readers (naturally looked up to by others for information), is seed sown in good soil for the advertiser.

Names and fortunes are gained, nine times in ten, by liberal and judicious advertising.

#### Premium for New Subscriptions.

There are many persons not familiar with the value of the PRESS who would ever after be thankful to our present subscribers for bringing their names on to our list of intelligent readers. Large additions can be made with little effort by the many in this way. We therefore offer (post paid) a premium of one of the patent newspaper file holders (advertised in this paper) for every two new subscriptions received with \$8 advanced payment.

#### Trade Mark Patents for Merchants and Manufacturers

Can now be secured to advantage under the NEW LAW

In the United States. Parties interested will be furnished with all information desired, and have their application intelligently prepared and promptly forwarded to the Patent Office, and their patents secured in good time, by DEWEY & CO., U. S. and Foreign Patent Agents, No. 414 Clay street, S. F.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Returning a newspaper or blank slip, WITHOUT THE NAME AND RESIDENCE OF THE SUBSCRIBER is a thoughtless act, and useless both to subscriber and publisher.

READERS will favor advertisers by mentioning the information gained from notices in our paper.

**NEGLECTED COUGHS AND COLDS**.—FEW ARE AWARE OF the importance of checking a Cough or "Common Cold" in its first stage; that which in the beginning would yield to a mild remedy, if neglected, soon preys upon the Lungs. "Brown's Bronchial Troches," or COUGH LOZENGES, afford instant relief.

Owing to the good reputation and popularity of the Troches, many worthless and cheap imitations are offered, which are good for nothing. Be sure to obtain the true "Brown's Bronchial Troches." Sold everywhere.

**N. Seibert's Eureka Lubricators** for steam cylinders are acknowledged by 150 engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time, in the saving of oil. Over the old style, are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First street, San Francisco. 8v23-3m

#### A Good Binder for \$1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for \$1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Sent postage free. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at John I. Tay's, Broadway, Oakland. apl-bp-1f

**MARAVILLA COCOA**.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoes, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers, Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. fcz-ly

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

\$5 TO \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 16 Dearborn street, Chicago, Ill. 23v1-12mbp

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING MACHINE, against any other, may apply to No. 284 Bowery, 157 E. 26th, 477 9th Ave., New York. Good work at high prices if desired. 21v1-12mbp

#### Special to Inventors.

All inventors who secure valuable patents through the SCIENTIFIC PRESS PATENT AGENCY are specially favored with a liberal notice of the merits of their inventions in the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS—two first-class weeklies, the most widely circulated of any on this coast, reaching the very best classes for the benefit of our ingenious citizens. In many cases we know that such notices have been worth more to patentees than the whole cost of obtaining patents. While we give the most able and experienced counsel to inventors, our terms are more favorable to Pacific Coast inventors than those of any other Agency in the United States, besides the benefit derived from having their inventions set forth rightly in the start by gratuitous publication in more than one highly reputable journal.

#### WALTHAM WATCHES.

In soliciting anew the public patronage of WATCHES of domestic production, the AMERICAN WATCH COMPANY respectfully represent:

That no fact in the history of manufactures is more completely demonstrated than that the best system of making Watches is the one first established by them at Waltham. That system always had the warrant of reason and common sense, and now the test of time in the trial of the Watches themselves cannot be denied to have been ample and satisfactory. It is admitted on every hand—the evidence of daily observation and common reputation—that the Watches not only keep correct time, but that as machines they ENDURE. It should seem that nothing more is needed, but that their size, shapes and appearance should suit the tastes of the people. As to all these conditions, the American Watch Co. are now fully prepared to answer the exactions of the market. They confidently assert there is no longer any need for such reasons to import watches of any description whatever. Every size in ordinary demand, every shape and every variety of finish and decoration, may now be had. And as to price, the recent reductions leave no room for doubt that the Waltham system of Watch-making is

#### The Most Economical as well as the Most Reliable,

And that the Waltham Watch is the Cheapest as well as the Best.

Many new varieties of movements have been added during the last year, all of which display the Latest Improvements in design and finish, and evince the rapid progress the Company is making toward perfection in the art. Among these the new small size Watch, for Boys and young gentlemen, is to be specially noted. A very low price has been made for this Watch because it is a boy's watch, and with the object of bringing it within the means of boys of all classes. Price being considered,

#### No such Watch, in Quality and Beauty,

Has over, in any country, been produced.

The "CRESCENT-STREET" FULL PLATE WATCH, added during the last year, is now made either with or without stem-winding and setting attachment. This Watch, in either form,

#### The Company Challenges all Manufacturers of all Countries

To beat or equal for its price. It is made with all the latest improvements in every part—improvements which improve—and which not only make it better for its purposes as a timekeeper, but will make it the great favorite with Watchmakers. This, the highest grade of full plate Watches made in this country, in size and appearance, in finish, and general excellence, is especially intended for and recommended to business men, and in particular to Railway and Expressmen, to constant travelers—in fact, to all live men who must be told by their Watches the correct time of day whenever they want it. All such men should have the

"American Watch Co., Crescent Street."

Counting on such destination for this variety of their manufacture, the company devote the greatest care to its construction, employ upon it only their best men and best machinery, and issue it with their reputation at stake upon its success.

For sale by all leading jewelers. No Watches retailed by the Company. For all other facts address

ROBBINS & APPLETON,

General Agents for American Watch Company, No. 1 Bond street, New York.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

**I. X. L. Gold and Silver Mining Company.**  
Location of works, Silver Mountain District, Alpine County, Cal.  
Notice.—The annual meeting of stockholders of the I. X. L. Gold and Silver Mining Company, for the purpose of electing Trustees for the ensuing year, will be held at the office of the Company, Pioneer Hall, 408 Montgomery street, San Francisco, California, at 2 o'clock, P. M., Thursday, Sept. 14, 1871.  
J. CROWNSHIELD, Secretary.

**Jeinsen Lubricator Company—Notice** is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 1st day of August, 1871, an assessment of Fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 425 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 15th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 24th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale.  
By order of the Board of Trustees.  
CALEB T. FAY, Secretary.  
Office, Room No. 7, No. 425 California street. au12

**Kincaid Flat Mining Company—Location** of works, Tuolumne County, State of California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of August, 1871, an assessment of two dollars and fifty cents (2.50) per share was levied upon the capital stock of said company, payable immediately, in U. S. gold and silver coin, to the Sec'y, at his office, No. 220 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 15th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 24th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
R. H. CORNELL, Secretary.  
Office, 220 Clay street, San Francisco. au12-4w

**Mina Rica Mining Company—Location** of works, Auburn District, Placer County, State of California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 8th day of August, 1871, an assessment of twenty (20) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room No. 2, No. 415 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 15th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 24th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
R. H. CORNELL, Secretary.  
Office, Room No. 2, third floor, No. 415 California street, San Francisco, California. au12-5w

By order of the Board of Trustees.  
T. F. CRONISE, Secretary.  
Office: 409 California street, (up stairs) San Francisco, Cal.

KNOWLES' PATENT STEAM PUMP.

It has no Crank or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.  
The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.  
The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.  
The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purpose, are got at immediately without removing any nuts or bolts.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, }  
SACRAMENTO, CAL., April 14, 1871.  
A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.  
Yours truly,  
A. J. STEVENS, General Master Mechanic.

OFFICE OF PEOPLE'S TRANSPORTATION CO., }  
PORTLAND, OREGON, April 22, 1871.  
Mr. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.  
Yours respectfully,  
G. MARSHALL, Chief Engineer.

OFFICE OF N. Y. CENTRAL R. R., ALBANY, June 3, 1871.  
Messrs. KNOWLES & SIBLEY, New York—Gents: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.  
Yours very truly,  
C. P. HARM.

OFFICE OF DELAMATER IRON WORKS, NEW YORK, May 26, 1871.  
Messrs. KNOWLES & SIBLEY, 92 Liberty street—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.  
Yours very truly  
GEORGE M. REYNOLDS, Supt. Engineer.

U. S. NAVY YARD, NEW YORK, June 3, 1871.  
Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.  
Yours very respectfully,  
WM. W. W. WOOD.

OFFICE OF THOMAS IRON WORKS, HOKENDAYPA, Pa., June 1, 1871.  
Messrs. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which to say the least are equal to the best we have tried. I cheerfully recommend "The Knowles Pump" to any who may have use for a first-rate Steam Pump.  
Respectfully yours, etc.,  
EDWIN MICKLEY, Supt. of Mines.

OFFICE OF THE SAUCON IRON CO., }  
HELLERSBURG, Northampton County, Pa., May 26, 1871.  
Messrs. KNOWLES & SIBLEY, New York—Gents: We can most cheerfully respond to your inquiry as to the qualities of the Knowles Patent Steam Pumps we have in use. We have bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severest tests. And we can say that they have given VERY GREAT satisfaction, and that we like them better than any we have ever used.  
Yours very respectfully,  
G. W. WHITTAKER, President and Superintendent.

OFFICE OF NEW HAVEN WATER CO., Dec. 13, 1869.  
Messrs. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyls., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.  
Yours very truly,  
P. SAULT, Superintendent.

CENTRAL AND WESTERN PACIFIC AND CAL. AND OREGON RAILROADS, }  
OFFICE Supt. W. M. P. & M., SACRAMENTO, CAL., July 8, 1870.  
A. L. FISH, Esq., San Francisco—Dear Sir: Your favor of the 2d inst. is received, asking my opinion in regard to the Knowles Steam Pump, and would say I have used the Knowles Steam Pump for several years, and consider them for all purposes the best steam pump in use. Yours truly, E. F. PERKINS, Supt. M. P. & M.

OFFICE OF RED BLUFF WATER WORKS, RED BLUFF, June 11, 1871.  
A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction; and I take great pleasure in recommending them to all you have claimed for them, and I will add that I think they have no equal. Yours, etc., JOHN O'LEMMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND  
THE LARGEST STOCK OF PUMPS IN THE WORLD,  
And for Every Conceivable Purpose.  
A. L. FISH, Agent.  
No 9 First Street, San Francisco, Cal.  
P. S.—All kinds of new and second-hand Machines on hand. 24v22-cow

**Tecumseh Gold, Silver and Copper Mining Company—Location** of Works, Gopher District, Calaveras county, California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 28th day of July, 1871, an assessment of five dollars (\$5) per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, F. J. HERMA, at the office of the company, 316 Kearny street. Any stock upon which said assessment shall remain unpaid on the 4th day of September, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 24th day of September, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
F. J. HERMA, Secretary.  
Office, 316 Kearny street, San Francisco. aug5d

The Great Equivalent.—The world may be safely challenged to produce so perfect a simulation of anything in nature, as  
Tarrant's Seltzer Aperient  
Is of its original, the Seltzer Spring of Germany. The Aperient, based on a correct analysis of the Seltzer Water, is even superior to the manufacture of Nature herself, because it contains all the active medicinal properties of the spring, unalloyed by any of the inert and useless particles found in all mineral fountains. THE GENUINE ARTICLE BEING SECURED, you have the Seltzer Water of Europe, purified and perfected, and probably the best, the most genial cathartic and antilithic preparation on the face of the earth.  
SOLD BY ALL DRUGGISTS.

**DENSLOW & BUSH'S "SAFETY" OIL**  
SAFEST OIL KNOWN.  
Will Not Explode! Stands a fire test over 15° Fahrenheit. We take ordinary Kerosene 110° fire test, and re-distill it by our new process, rejecting fully 1/2 (Benzine and Tar), the cause of all Kerosene explosions, bad odors, smoke, gas, etc. Our "SAFETY" Oil costs 1/2 cent per hour, and a lighted lamp may be used and broken without fear of explosion or fire. The Fire Underwriters of N. Y. recommend its use as a protection to life and property. For sale by all grocers, druggists, etc., in the U. S. Extra inducement to dealers. Address DENSLOW & BUSH, 130 Maiden Lane, N. Y. 8 Custom H. street, Boston, Mass.; 34 S. Calvert street, Baltimore, Md.; 51 S. Water street, Chicago, Ill.; or Cleveland, Ohio. P. B. 5-gallons expressed for \$3 to any place where not for sale. 8-v21st

WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation.  
For further particulars address

FURMAN R. WILSON,

San Francisco.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION:—D is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. F is the discharge pipe for the lubricant, provided with an inverted siphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the ejection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. fel3-tf

THE PATENT

Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

25v22-3m

TRAVIS & WAGNER!

**CRAIG & BREVOORT'S**  
Patent Condenser for Steam  
PUMPS, &c.

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as a guide to float F.

The valve, C, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached.

Platinum Scrap and Ore purchased. 22v18t

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

volume. Bound in cloth, \$5. A limited number only  
on hand.

### CHOLERA.

HOW TO CURE IT.

At the commencement of the Cholera, which always  
precedes an attack of the Cholera, take a teaspoonful of the  
Pain Killer in sugar and water (hot, if convenient), and  
then bathe freely the stomach and bowels with the Pain  
killer, clear. Should the diarrhoea or cramps continue, re-  
peat the dose every ten or fifteen minutes until the patient  
is relieved. In extreme cases, two or more teaspoonfuls  
may be given at a dose.

The Pain Killer, as an internal remedy, has no equal. In  
cases of Cholera, Summer Complaints, Dyspepsia, Dysin-  
tery, Asthma, it cures in one night, by taking it internally,  
and bathing with it freely. Its action is like magic, when  
externally applied to Old Sores, Burns, Scalds, and Sprains.  
For Sick Headache and Toothache, don't fail to try it. In  
short, it is a PAIN KILLER.  
Directions accompany each bottle.  
The Pain Killer is sold by all dealers in Medicines.  
Prices, 25 cents, 50 cents and \$1 per bottle.

## PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON  
SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other  
Bridge in the following points:  
Being built of wood entirely, they are not affected by change of temperature.  
The timber used is placed so directly in the line of strain, that less material is required to support the same load.  
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.  
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the  
Plan is used. For all Public Bridges the Plan will always be open to competition.  
Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.  
F. MALOON, Secretary.

W. H. GORRILL, President.

## John G. Hodge & Co.,

IMPORTERS AND WHOLESALE

STATIONERS,

KEEP A LARGE STOCK OF

Blank Books, Stationery, Wrapping and  
Cartridge Papers, &c., &c

Blank Books made to order from Crew  
Ex. Fine Ledger Paper.

Mining Companies, and Counting Houses, supplied  
Agents for A. W. Fisher's genuine Lead Pencils,  
327, 329 & 331 Sanson St. San Francisco.  
19v2leonly

Hubbard, Lippincott, Bakewell & Co.

## THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BLANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NEILSEN & CO.,  
General Agents, No. 210 Front Street.

*Pacific  
Insurance Company,  
No. 422 California St.,  
San Francisco.  
Cash Assets \$1750,000.  
Fire  
and Marine  
Insurance.*

## N. W. SPAULDING, Saw Smithing and Repairing ESTABLISHMENT.

Nos. 17 and 19 Fremont Street, near Market,

MANUFACTURER OF

SPAULDING'S

Patent Tooth Circular Saws.

They have proved to be the most durable and economi-  
cal Saws in the World.

Each Saw is Warranted in every respect.

Particular attention paid to construction of  
Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE  
At the lowest Market Prices.

H. ROYER,

Manufacturer of LEATHER BELTING AND LACING,  
MADE OF FULLER RAWHIDE, Factory, South Park Milla,  
Brannan street, bet. Third and Fourth, San Francisco.

33 Pacific Saw Manufacturing Co. are Sole  
Agents for H. Royer's Lacing Leathers. ns

**BAIRD'S  
BOOKS**  
FOR PRACTICAL MEN.

My new revised and enlarged Catalogue of PRACTI-  
CAL AND SCIENTIFIC BOOKS, complete to April 15,  
1871, 94 pages, 8 vo., will be sent, free of postage, to any  
one who will favor me with his address.

HENRY OAREY BAIRD,  
Industrial Publisher, 406 Walnut St.,  
Philadelphia.

### MANUFACTURERS.

J. E. Emerson's New Patent Flange Toothed Circular  
Saws, are superceding all others.

Crosby's Patent Gang Saw Buckle; Lippincott &  
Tuttle's Patent Cross Cut Saws; Davis' Patent Double  
Cut Gang Saws (cuts both ways); and all of the cele-  
brated brands of SAWS formerly manufactured by both  
HUBBARD BRO. & CO. and LIPPINCOTT & CO.

Also, SHOVELS, AXES AND SPADES.  
All orders from the Pacific Coast will receive special  
attention and be forwarded with dispatch.  
Our extensive facilities enable us to furnish our Goods  
at the

Lowest Market Prices,

[And all Warranted of SUPERIOR QUALITY.

## Brown's Vapor Burner.

From the number and various styles of vapor burners offered to the public, each one of which is pronounced unsurpassed and unsurpassable, one would naturally think that the time was not far distant when novelties would cease in this line of invention. But like all other articles of utility, the vapor burner has steadily received valuable additions and improvements, which have caused it to become a great household favorite.

The latest improvement in these burners with which we are acquainted, is the one invented by C. B. Brown, of Placerville, El Dorado county, this State, and recently patented through the agency of this office, an illustration of which is given below, attached to a vapor lamp.

In this class of lamps, the gas which is burned is generated in the burner tube, from the oil which flows downward from the oil vessel. This tube is usually packed with cotton, which conveys the oil by capillary attraction to the burner. Instead of cotton, Mr. Brown uses asbestos, a filmy, fibrous mineral which is inde-

BROWN'S VAPOR BURNER.

structible by heat, and which serves the purpose of raising the oil equally as well as cotton. In the upper end of the tube is an inverted conical plug, the upper end of which is hollow, and small holes in the plug serve for the escape of the gas to the reservoir, from which it passes through holes in the upper cap to be burned. A screw passes down through the top of the cap which covers the upper end of the tube, by which the supply of gas to the flame can be regulated. This burner gives a beautiful, steady light of great brilliancy, and will be appreciated by persons employing this class of lamps.

This burner is on exhibition at the Pavilion. All communications concerning it should be addressed to C. B. Brown, Placerville, Cal.

To show the importance of the movement of European capitalists to our mines, we are at liberty to state the fact that one party alone from London has recently spent \$4,000 for cable dispatches concerning the purchase of mines in this country.

## Musical Dancing Toy for Pianos.

The accompanying engraving is a perspective view of a new scientific toy invented by G. L. Wild & Bro., of Washington, D. C. Its operation depends entirely on the vibration derived from the sounding-board of a piano, to which it can be attached, and is a simple and very amusing

spring. The vibration of the sounding-board is communicated through the stand to the table, where it is spread out in increased force, causing the figures, through their elastic supports, to spring about in a most comical way. It is evident that a great deal of fun may be elicited therefrom; and there is something so natural and life-like in the grotesque groupings and comical motions of the figures, that it not only

WILD'S MUSICAL DANCING TOY FOR PIANOS.

little toy. It is principally a light, round table with a fancy gilt or lace trimming around the upper edge, with a screw clamp for attaching it to the sounding-board of the piano, which can easily be done without injuring the instrument. In reference to the cut, A is the table, B the stand, C

amuses the little ones, but grown people as well. For particulars as to price, patent rights, agencies, etc., see advertisement in another column.

## Hydraulic Joint and Discharge Pipe.

Hydraulic mining since its discovery,

HOSKIN'S IMPROVED HYDRAULIC JOINT AND DISCHARGE PIPE.

and D forming the clamp. When it is to be applied, the stand is screwed to the bottom of the table, and the lower end is adjusted by turning the screw, D, of the clamp, which fastens it to the sounding-board, E E. Then a number of small figures or images are placed on the table, and, on performing on the instrument, the figures appear charmed into life and motion by the music. The effect is very pretty, and no complicated mechanism is required to produce it. The figures are made of wood, and dressed to represent a variety of characters and nationalities; the arms, legs and heads are movable, and they are supported on stiff bristles or steel wire

less than 20 years ago, has been constantly improved in its method and appliances. One of the greatest steps in its progress has been the transition from the use of canvas hose and small discharge pipes, held in the hands of the single operator, (in a manner similar to the nozzle of a common fire hose), to the use of iron pipes of large calibre. Those are connected with immense sized discharge pipes, having universal joints curiously and ingeniously balanced so that the stream may be directed at pleasure by the simple pressure of the hand.

It is one of these latter machines that we present in our illustration to day, invented

and patented through this office by Richard Hoskin, of Dutch Flat, a practical miner and mechanic. The lower joint is for the horizontal turning of the nozzle, and the forward joint for its vertical movement. The box shown is weighted with stones sufficient to balance the discharge pipe, and render the turning easy.

One of the superior features of this joint is the reduction of the "sticking angle of the water" in its passage of the joint by its peculiar design shown in the cut.

Mr. Hoskin's apparatus, now exhibited at the Mechanics' Institute Fair, consists of a pipe nearly 8 feet long, with a joint 11 inches in diameter. The discharge pipe is calculated for nozzles carrying a stream 6 inches and less. As may be seen, its nozzle can be moved in any direction by the pressure of a finger.

The power of each individual inch of water is greatly augmented, where used in a massive stream under a high pressure, as practice proves. The hanks of our hydraulic diggings are pulverized and disintegrated by this new method of hydraulicing with so much greater economy over the old system, that many claims are now worked with profit that formerly run their owners in debt for water bills.

## Stephens' Patent Combination Rule.

The accompanying cut represents this useful and handy little tool which will be found convenient for people of almost any

STEPHENS' COMBINATION RULE.

trade or profession. It is made of box wood and bound very heavily with brass, and looks as if it would last a lifetime. It has only one joint, and being a foot rule, is six inches long when closed. The cut represents it in three positions. First—a spirit level; second—a try-square and plumb; and third—a clinometer or slope level, which is marked on the steel blade that folds into the rule itself. This is graduated, noting the degrees of the angles that are formed by opening the legs of the rule—the blade sliding through the groove in the end of the leg. When extended to 45°, of course the angle is 45°, the blade has fallen 27½° from a right angle or square. The glass, covering the spirit level, can be removed by means of screws so as to be adjusted in case of irregularity. This little tool embraces in itself a carpenter's rule, spirit level, square, plumb, bevel, indicator, brace scale, protractor, a right-angled triangle, and with a straight edge can be used as a parallel rule. It is the convenience of tools like this that lightens labor and spares endless calculation and measurement. Inventors can often do more good to humanity by perfecting some useful little invention like this, than by racking their brains over some mechanical problem which interests only a few. Every farmer as well as mechanic, should be supplied with one of these useful little instruments. Information concerning this beautiful contrivance can be had by addressing Stephens & Co., Riverton, Connecticut.

## SCIENTIFIC PROGRESS.

### The Influence of Coffee and Cocoa.

M. Rabuteau gave an interesting account at a late meeting of the Academy of Sciences in Paris, on the influence of coffee and cocoa on alimentation. Two dogs—we condense from *Comptes Rendus*—were taken, as nearly as possible identical in size and condition, one was fed every day with 20 grammes of bread, 10 grammes of fresh butter, and 10 grammes of sugar; the other with 20 grammes of cocoa, 10 grammes of sugar, and an infusion of 20 grammes of roasted coffee. This last ration it is observed contained less solid matter by weight, than the preceding. The first dog grew very thin in a short time, and died in twenty-nine days, showing all the symptoms of an insufficient nourishment. The other continued healthy, though he grew thin, but not so much as the first dog.

The experimenter having been called away to duty at the fortifications just after the first dog died, he was unable to feed the second as he had purposed, and the animal not receiving any nourishment died at the end of four days.

M. Rabuteau thinks that coffee should not be roasted in a covered vessel, as is generally done in large establishments, and in manufactories of ground coffee. He says the roasting should be so accomplished that the coffee shall contain all the caffeine, the true active principle of the berry, and should not contain caffeine, an essential oil developed in roasting. This latter principle the author asserts is one which excites and causes the injurious effects so often found to arise from the use of coffee. Its formation may be to a considerable extent prevented by roasting the coffee in a current of heated air.

A discussion on the subject followed, in which it was questioned whether coffee and cocoa were to be considered as aliments, M. Chevreul expressing his belief that personal idiosyncrasies had much to do with it. He also remarks on the difficulty of settling the question for want of a standard by which to be guided, as for instance the percentage of nitrogen, which, however is fallacious.

### Experimental Researches on the Nutritive Properties of Cocoa.

At the same meeting M. Ch. Gazeau reported upon some experimenting on the nutritive properties of cocoa, which he had made himself. He found that the use of cocoa increased the amount of urea voided, from 11 to 16 per cent. or more, the mean temperature of the body was increased 0.32°, the arterial pulsations from 11 to 22, and the number of respirations from 4 to 6. In the use of cocoa the author believes that the vital powers are really drawn upon so that the benefits derived from its use are more apparent than real.

A discussion on this subject followed, in which the extensive use of the cocoa by South American Indians was referred to.

**EFFECTS OF DIFFERENTLY COLORED RAYS ON DEVELOPMENT.**—Some interesting experiments have recently been made, from which it has been ascertained that certain colored rays of light are particularly favorable to the development, in organic infusion, of infusorial life, while other rays are more favorable for the production of microscopic forms of vegetable life. Thus, M. Pouchet says, *white* light is the best fitted for obtaining the former result, after which comes the *red* ray, then the *violet*, the *blue*, and finally the *green* ray. On the contrary, for the development of vegetable "proto-organisms," the *green* ray is the best fitted; next to this the *blue* and *violet* rays; and, lastly, the *white* light; the *red* ray hindering the development of these organisms.

**SORBY ON TINTS OF AUTUMNAL FOLIAGE.** In an elaborate article by Mr. Sorby upon the varied tints of autumnal foliage, in a recent number of the *Quarterly Journal of Science*, he comes to the conclusion that the production of the fine tints of autumn is an evidence of diminished vital powers of the plants. This generalization also agrees with the fact that the unhealthy branches of a tree turn yellow, while the rest remain green, the subsequent development of more sombre tints being evidence of more complete death.

**TRANSIT OF VENUS.**—There will be a transit of Venus across the sun, in 1874, and astronomers are already busy in making arrangements for its careful examination, as by it the distance of the sun from the earth is determined. The last transit of Venus was in 1769.

### Meteoric Stones.

M. St. Meunier, who has made the subject quite a study, gives the following distinguishing characteristics as found in different meteorites:—Some specimens consist of a brecciated mass, like what he calls Lucite from the meteorite of Luce; others consist of a brownish porous mass, called Limerickite, from a meteor which fell near Limerick; and others still present a blackish mass, called by M. St. M., *tadjerite*. The two former have been found blended together, in which cases we think they must have originally belonged to a planet where these two minerals occur in juxtaposition. He has produced the black rock called *tadjerite* artificially, by heating a breccia composed of *amatite* and *chertinite* to fusion. Hence he concludes that *tadjerite* has been a rock of that description, which has been subjected to metamorphic action. *Tadjerite* often occurs as a black covering to the brecciated masses, which he thinks is due to fusion, probably from friction, [in its passage through the atmosphere] and by its depth shows the intensity of the heat to which it has been subjected.

While most meteors appear to have been simply fused and cooled; others show the result of a more complicated geological action. He considers that the Widmanstetter lines on meteoric iron indicate that it is an eruptive mass.

The same author infers, from the analogy of meteorites, that the solidification of the terrestrial globe proceeded from the surface to the center.

**DIRECT CONDENSATION OF WATERY VAPOR.**—Professor Forel, of Lausanne, after long-continued observation, has determined the quantity of water passing the Rhone below the Lake of Geneva, and finds that to furnish this amount it would require an atmospheric precipitation in the above, of nearly 45 inches. The actual precipitation, however, amounts to but 27½ inches; and the question arises, therefore, whence comes the surplus water? Professor Dufour finds its origin in the direct condensation of the atmospheric vapor on the ice, the cold rocks, and the snow-fields of the Alps. The following experiment may serve to elucidate the principle involved: A vessel containing a cooling mixture of 672 grams in weight, on being exposed for an hour in the calm, open air, increased five grams in weight from the vapor condensed on its exterior. Direct measurements at suitable points would be interesting for the purpose of ascertaining approximately what quantity of water is thus actually carried to the river.

**SUDDEN AND SPONTANEOUS OPACITY OF GAS CONTAINED IN A BALLOON.**—Observations having frequently been made by aeronauts, says *Les Mondes*, that when the gas is allowed to escape from balloons when in an elevated position, it appears like a whitish smoke, whence aeronauts coined the expression of "the balloon smoking the pipe." M. de Fonvielle explains this as the result of cold which arises from the increase in volume of the balloon in a rarefied atmosphere. The vapor of water in the gas is thus condensed, and assumes the whitish smoke-like appearance.

**ANOTHER PLANET.**—Prof. Watson of the observatory of the Michigan University, Ann Arbor, says:—"I have discovered in the constellation of Capricorn a planet hitherto unknown. It shines like a star of tenth magnitude. It is situated in the right ascension, three hundred and twenty degrees, sixteen minutes, and in the declination, twelve degrees thirty minutes south. It is moving south and west."

**COMBINED RUBBER AND COPPER WIRE FOR PIPE COUPLINGS.**—Mr. Fred. Kible, of Baltimore, Md., has, says the *Scientific American*, patented an improved joint for water pipes, steam pipes and chests around bolts, etc., whether the joint be round, square, or any other shape. It consists in a rubber plate and copper wire for forming the joint. The plate made of rubber or other suitable material is cut to fit between the faces that form the joint. On this is placed a copper wire bent to fit the hole around which the joint is to be made. The wire should be one size larger than the thickness of the rubber. This construction permits the wire to be arranged as desired so as to avoid flaws in the plates. If desired two rubber plates can be used with the copper wire placed between.

## MECHANICAL PROGRESS.

### Sawing and Seasoning Timber.

"Every builder and lumber dealer has observed that when the heart of a tree is near the center of a hewed or sawed beam, post or sill, the timber is apt to crack badly from the heart outward while the process of seasoning is going on. The decay of the timber is immensely quickened by these cracks, which admit water, and harbor whole swarms of vermin. On the other hand, the timber will never crack while seasoning, if the tree has been sawed through the heart. It often happens a tree from which sills or plates for a barn are to be made is of sufficient size for two or even four pieces, if the logs are sawed through the middle. It will pay handsomely, unless the circumstances are very unfavorable, the road extremely rough and the distance great, to haul a log of such size to the saw mill, where it can be sawed through the heart into two or more pieces as the case may be—thus not only saving largely in amount of timber obtained from the log, but greatly improving its seasoning and working qualities. The difficulty of hauling and sawing a log of unusual length may be overcome by the exercise of a little engineering skill. Supposing a long stick of timber to have been hewed one foot square, it can readily be chained under the axle tree of a lumber wagon and lashing the free ends of the reaches to the timber. The sawing at the mill in the desired manner may be easily accomplished, even though the stick be twice the length of the saw mill carriage, by allowing one end to project beyond the head block."—*Leffel's News.*

**SPLIT VS. SAWED PLANK.**—At an early period, the trunks of trees were split into planks with wedges, and these were afterwards reduced by the operation of the adze. Before the middle of the sixteenth century, all the plank in Norway was hewn in this manner, and trees from which seven or eight boards could now be formed, then only produced two. This simple but wasteful mode has not in some parts of the north, been even yet entirely exploded; and it must be admitted that it is attended with some advantages which the use of the saw does not afford. The work is more expeditiously performed, and split timber is far stronger than that which has been sawn, for the fissure follows the grain of the wood, and leaves it undivided; whereas the saw, by cutting along a specific line, divides the fibres, and thus weakens its cohesion and solidity. Besides, as the fibres retain their natural position, they are easier bent, and this is an advantage in many kinds of work which more than compensate for the timber being sometimes warped.—*Etc.*

**A REVOLVING SAFE.**—Among the articles exhibited in the industrial department of the London International Exhibition just concluded, is something new in the shape of a revolving safe, for which the exhibitor claims the usual requisites of thorough security against thieves and fires. Unlike all other safes this is made in a circular shape, and, when locked and placed in a position either against a wall, or built into it, the door is turned into the wall, the back facing the spectator. To open the safe, a lock is opened in a strong iron box, on which the safe rests. This moves a spring, which enables the operator, by means of a small hand key, to bring the door of the safe round to the front, and causes a bell to ring a loud alarm. The door being opened by means of a key, another door presents itself, which is opened by being moved round to the back of the safe. The invention has been much admired and favorably considered.

**A FRICTIONLESS PEN.**—Sir Wm. Thomson's siphon recorder is the great telegraph novelty of the day. The reading of the signals is effected by means of a siphon, or capillary glass tube, about two inches long, the shorter end of which dips into a dish of ink, while the larger hangs down, in front of a paper strip moved forward by clockwork. The miniature glass siphon is connected, by a very fine aluminum wire, with a coil suspended between the poles of an electro-magnet, and is moved backwards and forwards as it is deflected to the right or the left. To persuade a camel to get through the eye of a needle would, under ordinary circumstances, not be a more difficult feat than to get ink through the capillary tube under ordinary pressure. But it is actually ejected in a tiny stream

from the lower end of the siphon, by the simple and ingenious expedient of keeping the ink electrified to a high tension. It is a well known fact that, when any liquid is electrified, its particles repelling each other, it is enabled to flow through the finest orifice; and this fact, judiciously taken advantage of by Sir William Thomson, has enabled him to produce a frictionless pen point. The electrification of the ink in the reservoir is done by a rotating electrophorus or replenisher, kept in motion by an electro-magnetic machine.

**DRILLING WITH SAND.**—It is said that a jet of quartz sand blown through a pipe by steam, at 30 lbs. pressure to the square inch, will make a hole in a solid block of corundum an inch and a half deep and of the same diameter, in less than 25 minutes. Corundum is little, if at all, inferior in hardness, to the diamond; in comparison, even blued steel is soft, and granite absolutely pulpy. This remarkable mechanical discovery is due to M. B. C. Tilghman, an engineer of Philadelphia, who turns upon corundum a pipe which discharges sifted sand, mixed with a furious squirting of steam, and the fine shower of particles thus flung cuts a hole equal to the diameter of the jet. The same effect is produced in anything else submitted to the process.

So great a force of steam is not necessary for finer work, such as grinding or engraving glass. For this purpose, a blast of air may be employed by means of a rotary fan. The tube is fed with sifted sand, which the air-blast takes up and whirls against the glass. It will thus completely demolish a surface moving past at the rate of five inches in the minute, and the spent sand and sand-dust can be perpetually returned and re-employed. Moreover, by covering parts of the glass with any semi-elastic material, such as paper, lace, caoutchouc, or oil-paint, designs of any sort may be engraved. The particles which eat off the hard glass or stone beat in vain upon the interposed medium, and so curious is this resistance that even a green fern leaf may be used, and the sand-shower will consume all but the parts thus covered, leaving a delicate pattern of the frond. The film of bichromated gelatine used for photographic negatives, may also be thus utilized for producing an engraving on glass or steel; and by a very simple arrangement the jet can be rendered movable, and handled with an absolutely artistic freedom.

**SILICATE OF POTASSA IN STRENGTHENING FOSSIL SKELETONS.**—A very judicious application of the silicate of potassa has been lately made at the Museum of Natural History of Paris, in repairing many fossil skeletons which had been disassembled and broken by the shells bursting in this palace of science.

The solutions have been first used diluted to about 30° Beaumé, and afterwards of a higher degree of concentration. The adhesion of the broken or separated pieces is brought together by applying with a brush, some of the solution of silicate of potassa on the parts to be joined, then they are left to dry, and the joint is hardly visible; and the joined part is far stronger than the remainder of the bone. Very delicate and porous anatomical pieces, as skeletons of birds, insects, etc., can be dipped repeatedly in more diluted solutions, and thus be rendered very hard and tenacious.

**EXTRACTING OIL FROM OIL-CAKE.**—A process apparently designed for extracting the residue of oil from cold pressed oil-cake has lately been brought out in Liverpool, England. The cakes from which the oil is to be extracted are first reduced to pulp in a steam-jacketed kettle, by the solvent action of dry heat, in combination or not, with an acidulated vapor. The pulp is then placed in bags, and is subjected to a graduated pressure. The pulp is then filled into bags and pressed. As soon as the first or virgin oil has flowed, the pressure and heat are increased, and a small amount of free steam is allowed to act on the edges of the bags.—*Artisan.*

**NEW, INGENIOUS AND USEFUL.**—Messrs. Osgood and Co., the eminent publishing firm of Boston, have had a machine built expressly for them, which at one operation trims the main sheet and supplement of their illustrated newspaper, *Every Saturday*, pastes the leaves securely together, and folds them at the rate of 1,800 copies per hour. This ingenious machine, just invented, will mark an era in the publication of large illustrated newspapers.

# CORRESPONDENCE.

## A TRIP THROUGH UTAH TERRITORY.

BY OUR OWN TRAVELER.

### A Visit to the Mines.

We left Salt Lake City at 7 A. M. for Little Cottonwood Cañon. Four and six-horse coaches owned by Chislett & Co. run from Salt Lake to Emmaville and Central City, and the distance to the latter place is 30 miles. Passing to the south we follow the Wasatch range of mountains for about 18 miles and then up what is known as Little Cottonwood Cañon, passing Emma-ville, Granite, and Tannerville on the way, and arrive in the evening at Central City. The road up the Cañon is rough and steep. At the mouth of it we passed the smelting works of J. C. Bateman & Co. where there are two of Blitz's furnaces, 3 feet and 6 inches in diameter with 5 tweeters. The furnaces have a capacity of about 10 tons per day. The fire clay used comes from Camp Floyd in this Territory and answers the purpose required very well. The charcoal used is from Truckee and costs 27 cts. per bushel. A fine water privilege and a Turbine wheel furnish the power to run one of Root's patent "Blowers." They are running night and day on ore from the "Flagstaff mine."

At Granite City the Mormons are quarrying stone for their new temple, though at present but few men are employed.

At Tannerville there is a smelting furnace of 20 tons capacity, owned by Messrs. Jones & Pardee. They are running day and night and are doing well. A new furnace is at present in process of construction.

### Central City and Alta

May be spoken of as one town as they are so close together. The elevation is 8,300 feet, and the population about 600. There are two butcher shops, one hotel, a restaurant, two stores and a few saloons.

This situation, so near what are without doubt some of the richest mines in the United States, will eventually cause the place to become a good camp. The hills are being prospected for chlorides daily, but there is no excitement, and the district has come into notice on its own merits, and I will say that to-day it has one of the largest paying mines in the U. S.

The mountains in the vicinity abound in timber fit for mining purposes. And there is plenty of water running down the canon. On the high mountains near by, the snow lies from 8 to 10 feet deep all the year round, and the roads in winter are almost impassable for teams.

### The Emma Mine.

I was naturally anxious to see this famed Emma mine. I walked up about half a mile from the city on the side of a range dividing Big and Little Cottonwood canon to see it. I had the pleasure of going through it in company with the Supt. We passed up from the office to the large ore shed. The ore is taken from the mine and dumped down the "inclino" to the shed where it is sacked and sent to Salt Lake City. There are six men engaged in filling and six in sewing the sacks, which hold from 85 to 100 lbs. each. The ore is soft and decomposed and like fine dirt or sand. There are 100 two-horse wagons engaged in hauling ore, and I am informed that last month they carried about 95 tons daily, on an average.

This mine was located in 1868 by J. F. Woodman, who sunk a shaft about 125 feet deep before striking any large body of ore. He followed down a small streak of red colored matter, known as *red ochre*, which is considered as a good indication in this district. There have been a few side drifts run north and south from 12 to 16 feet, in one of which they struck it and sunk 65 feet through the solid body of rich ore. They have run a tunnel through the solid formation 405 feet, beginning near the original discovery shaft, and here they struck one of the largest bodies of ore I have ever seen. At the end of the tunnel we find ourselves in a large room or cav-

ern, timbered in a substantial manner, bearing evidences of engineering skill and good workmanship. From the level of the tunnel may be seen 11 floors or galleries, each 71 feet in length, 26 wide and 7 feet in height. From the galleries they are still taking out ore. The timbers used are 10 inches square and 7 feet long and the ties and caps are of equal dimensions, making a solid square framework.

The deposit dips at an angle of 50 degrees to the N. E. and the lode or body of ore runs east and west, and shows, it is said, an open fissure at the eastern end. In this "chimney" to the right and below the tunnel level a shaft has been sunk 93 feet deep. At 60 feet they run another level from which they are now extracting about the same quality of ore as above. They are still sinking this shaft as it seems to be a large deposit and of an unknown length. It is said that nine-tenths of all the ore taken out is sacked for shipment.

There are 45 men employed on each shift, and four carpenters are kept busy preparing timber. The ore, oxide and carbonate of lead, contains a high percentage of silver. It will average from 35 to 40 per cent. of lead, and assays from \$190 to \$200 per ton in silver, with a small proportion of gold, \$3 to \$7. The richness of the ore has increased with the depth and it is easily worked since it requires no blasting. The vein is in limestone formation and the ore averages about \$135 profit, after paying all expenses of mining, hauling, and reduction. The principal purchasers of this ore are Messrs. Bath & Son, Liverpool, Eng., and they send it to the Swansea Smelting Co. for reduction, latterly, however, small parcels have been worked here in the Territory.

The average daily shipment for last month was 112 tons which at \$135 per ton would be \$15,120 per day, and multiplied by 365, gives the wonderful product for a year's run at this rate as \$5,518,800. The owners of this wonderful mine are T. W. Park of N. Y., Jas. M. Day, of Ill., H. H. Baxter, of N. Y., Walker Bros., Salt Lake, Capt. Jas. Smith, Salt Lake, Warren Henry of the First National Bank of Utah, and W. W. Chisholm of Salt Lake City. They claim 3,000 feet on the lode.

### The North Star Mine

Is located a few rods from the old prospect shaft of the "Emma" and is a good mine. I understand that it was taken up in 1865 by Brain & Nichols, though the Discovery shaft was sunk but a few feet. They own two locations on the ledge, the North Star, running N. W., the St. Louis, a southeasterly course. The North Star tunnel is in 110 and the incline 210 feet, the ledge is from three to six feet in width. The ore yields 60 per cent. lead, and about 100 ounces of silver to the ton. It was formerly shipped to England, but is now worked at Robbin's furnace. Mr. D. C. Nichols is superintendent.

### Utah Mine and Tunnel

Is located 800 feet west of the Emma mine. Six men are employed and they are now through the lime rock 100 feet, and hope to strike either a "blind" ledge or one of those that they own, on the bill. R. Y. Anderson of San José, Cal., is superintendent.

### The Little Cottonwood Mining and Tunnel Co.

Are running a tunnel a short distance above the "Emma" on the hill-side; Mr. T. F. Muller is Supt. On this hill, which pitches about 45 degrees, there is a tramway running nearly to the top, and built by M. W. A. Lyon, for the purpose of taking ore from the mines that are up on the "divide." The gauge is 12 inches, and three rails are used. It runs a distance of 1,265 feet, and at the end of it, is situated the

### Savage Mine,

Which was located in June 1870, and is owned by Walker & Bro. and Wall & Co. They have an incline down 100 feet, then a shaft 60 feet, and then another incline 40 feet following the ledge, which dips east, all the way. There are 70 tons of good ore on the dump and a large quantity not sacked up, and on account of the inclemency of the winter, there was no chance to ship it, although they continued taking it out. The ore averages, I have been informed, about \$300 per ton, and that which is first-class will go even higher. There are 15 men at work, for wages from \$2.00 to \$2.50 and \$3.00 per day and board. Work is carried on day and night. The intentions are to tap the ledge by a tunnel 100 feet below the level of the place where the men are now at work.

The average width of the lode is four feet, although in the lower incline it shows itself on all sides. A few feet from the savage is the

### Montezuma,

Another good mine owned by the same company, and taken up in June, 1870. The incline is in 280 feet and the vein is about four feet wide. There are ten men employed. Three hundred tons are on the dumps awaiting shipment to the smelting works. It averages about \$125 per ton. The lode runs N. E., and the ore is carbonate and oxide of lead.

### The Eagle Lode

Is a short distance from the above mine, and is only a few feet on a vein running parallel with the savage and others. The ore looks well. Further up the hill and a few hundred feet west, is the famous

### Flagstaff Mine.

Where there are nearly 200 tons of ore on the dump being sacked for shipment. The superintendent being absent I did not enter the mine, but it is said by all to be first-rate, and equal to the Savage. Climbing the hill and passing along the ridge of the "divide" we arrive at the

### Davenport Mine.

The shaft is 25 feet deep and then comes an incline of 60 feet all in ore that will average, by smelting process, I am told, \$150 per ton. The character of ore is gray and red carbonate, and oxide of lead. The Center Mining Company, S. W. Howland, Pres., is located near the Emma, on the east side, and they have sunk a shaft about 35 feet deep. Incorporated June, 1871.

The end of the Big Cottonwood Canon is known as "Silver Fork" and among the principal mines are the "Prince of Wales," and the "Highland Chief," the "Reed & Brown" is also a good mine, and is considered a true fissure vein.

The Utah Southern R. R. is now being extended along the foot of these mountains, and a branch track is expected to reach to the mouth of the canon. This will greatly facilitate transportation and materially decrease the number of teams which now crowd the roads. With the advantages possessed by this camp in its undoubtedly rich mines, abundance of wood and water, accessibility, and facilities for transportation, we can safely predict for it a brilliant future.

## Boiler Explosions.—Prevention Better than Cure.

EDITORS PRESS:—As the subject of boiler explosions is being much agitated at the present time, and a great deal is being said about the competence of engineers, I think that if a law was passed with the following for its substance, it would go a great way toward relieving the minds of those who travel or risk their lives with steam in any of its applications.

I would have the law formed, making it a crime, punishable by a heavy fine, for any person to employ a man as engineer who cannot show a proper certificate or other proof of his ability to take proper care of the boiler entrusted to his charge, and should also make it as much an offense for any person to hire out for such a position, unless he could comply with the same requirements. If this was only carried out I think we should hear less often of explosions, and should, indirectly, encourage competency in the engineering profession. As it is, a person who has faithfully served his time and studied diligently in order to fit himself for the position of a practical engineer, has little chance of finding employment at remunerative rates, when people who are too mean to pay a decent price can hire a "shovel engineer" or mere machinists to do the work for what an engineer would be unwilling to give his services for.

I would commend the above to the attention of our prospective law-makers, and think such a bill would find many advocates in all classes of society.

H. M. CALDWELL.

### The San Diego Mines.

Our correspondent "Quartz" writes from Julian District substantially as follows: Mining matters are improving in this section of country. The mine owned by the Bailey Bros. looks better than ever; the ledge is wide and the rock is excellent. The facilities for working this claim are great, being on the side of a steep hill so that they can run in on the ledge, which they have done in three places. The creek has been tapped and a fine stream of water brought around in a ditch at a

salient light to give them plenty of fall and power for the 5-stamp battery which they intend to put up. This ledge "crops out" for a long distance and the ore contains a large proportion of silver in addition to free gold. On the Redman Mine, the shaft has been sunk 68 feet, where the ledge is 6 feet wide. The ore yields from \$40 to \$50 per ton.

The Golden Chariot looks better than ever, is 9 feet wide, with rock showing abundance of free gold.

The Kentuck company is still sinking a shaft, now 48 feet deep. The last crushing yielded \$76. The Madden ledge is 18 inches wide and shaft down 55 feet, the last crushing yielded at McMechans mill \$63.15 per ton.

The Antelope company are taking out about three tons per day, which varies all the way from \$25 to \$75 per ton. Mr. Tierman's improvements in the McMechan mill are a success, and it is thought that by his system of working, the mines will pay much better than heretofore.

### Bull Run, Nevada.

A correspondent writing over the signature "Miner" gives us the following from that section.

There has been a considerable amount of ore shipped from here to Mountain City for reduction. At the Advance mill the demand for working has been so great that Mr. Davis, the Superintendent, has concluded that he will only work 15 tons for each party applying.

THE BLUE JACKET has just had 15 tons put through, which yielded satisfactorily. There are six men at work sinking, and 15 tons are taken out daily. The "Found Treasure," "Highland," "Tiger," and several other companies have shipped small lots, but the means of transportation are insufficient for the amounts, there being only one pack train, which occupies three days in the trip to Mountain City, and carries but four tons each time. Of the other mines the "Porter" Co. are working 10 men and the "Ontario" and "Tiger" companies are sinking on their ledges, the latter employing all the men that can be had.

THE LADY DON company are running a tunnel on their ledge which "crops out" for a distance of 500 feet and shows an abundance of ore. There is a great demand here for a smelting furnace, there being large quantities of galena ore which will average from 30 to 70 per cent. in lead, and will go from \$50 to \$200 per ton in silver, and it is thought that 1,000 tons of this ore could readily be procured from the different dumps alone. There are large quantities of ore here which are altogether too base to be worked by any mill process. The mines were never in better condition than at the present time.

LOWER CALIFORNIA FARMING AND MANUFACTURING Co.—Another Lower California company has been organized under the above name which, however, disclaims all connection with the Magdalena Bay project; it being some 200 miles distant from the locality of the moss gatherers, and on the opposite side of the peninsula.

According to the certificate of incorporation, the capital stock is \$48,000, and the company claims 42,000 acres of valley land on the gulf coast of Lower California under titles confirmed by the highest Judicial Court of Mexico. The objects of the company are to restore the ancient aqueducts at the Magdalena Mission and introduce the water for manufacturing and irrigating purposes and to cultivate the land so as to raise sugar cane, cotton, coffee, tobacco, grapes, and the varied products grown in a semi-tropical climate. They propose also to furnish sufficient water power, not only for their own use, but for renting out the power to capitalists who may desire to establish ore reduction works, plaster of paris or cement factories, the material for which is on the spot.

We understand that one of the evidences of the fertility of the soil is the ruins of the old aqueducts which it is proposed to restore, and the fact that a Jesuit mission, usually selected with care as to facilities for cultivation, formerly existed there.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

GLONE.—Monitor *Miner*, Aug. 19th: A new vein of rich black copper ore was struck in this mine early in the week, from which much is expected. A large body will evidently be found where the two veins come together below.

EXTENSIVE preparations are going on at the lower end of Main street in grading out and walling up the creek, and we hear that a large quartz mill is at once to go up; 25 to 50 men are at work. In regard to the mill we do not deem the information very reliable.

### CALAVERAS COUNTY.

WHAT CHEER.—Calaveras *Chronicle*, Aug. 26th: The incline is nearly shoved down to the channel. Gravel has been struck and it contains gold.

A CHUCK.—\$6,000, retorted gold, were cleaned up at the Paloma this week—the result of 8 days, crushing with 16 stamps.

### LAKE COUNTY.

KNOXVILLE.—Lower Lake *Bulletin*, Aug. 19th: At the Redington mine about 150 men are employed. They are getting out a very good lot of ore.

### LOS ANGELES COUNTY.

BULLION.—Los Angeles *News*, Aug. 26th: 310 bars of lead bullion were received yesterday from the Union works Cerro Gordo. As also 585 bars weighing in the aggregate 48,697 lbs. from same place.

ASSAYER'S RETURNS.—210 pounds of ore from the Winnemucca mine Clark Dist., assayed at the rate of \$874.96 per ton in silver.

SAN GABRIEL CANON.—Several months ago a company was formed with a view to placer mining in the canon. About \$2,000 was spent and operations commenced on the old plan of ground-sluicing. The first clean-up, from an area between 30 and 40 ft. square, yielding \$250. Since that time the mine has continued to increase in value, and now the company is about to put into use improved hydraulic machinery.

LOS ANGELES, Aug. 29th: A party of prospectors left to-day for Arizona. Rumors prevail of silver lodes being found in the mountains north of the city.

### MARIPOSA COUNTY.

ACCIDENT.—Mariposa *Gazette*, Aug. 25th: A miner named G. Powell was blown up in the "Oakes & Reese" quartz mine, Hunter's Valley, on Tuesday. The blast exploded before he could get away, and one piece of rock struck him in the side, causing the worst cut he received.

DORSEY MINE situated about 2 miles southeast of Hornitos, has been sold for \$12,800. There are about 400 tons of rock taken out that will average \$46 per ton which was sold with the mine. The vein is 3 ft. wide and of solid sulphurets.

JERSEY QUARTZ VEIN No. 1, is producing good rock. They have a vein 5 feet thick and the rock will average \$45 per ton. There is a good deal of sulphurets in the vein which will pay \$200 per ton. No. 2 looks well, and from prospects will pay a good dividend to its owner.

SPRING LEDGE.—There was a party of capitalists here to look at the vein with a view of purchasing. The prospects are that they will purchase.

### NEVADA COUNTY.

MINING LOCATION.—Nevada *Transcript*; G. Miller, A. Dolt, F. W. Smith and others have filed a notice, locating a quartz claim in Grass Valley township, it being an extension of 800 feet on the Grand Ledge, under the name of the Wolverine Co.

DAISY HILL MINE.—Grass Valley *Union*, Aug. 29th: A crushing of 26 loads has just been cleaned up and gave \$37.50 to the load of a total in coin value of \$975.

PROSPECTORS.—Several Rough & Ready miners left that place for Trinity county on a prospecting tour. The party intended locating claims and surveying and cutting ditches to bring in water, which they will probably accomplish in time to get at work the coming season.

### PLACER COUNTY.

RISEING SUN MINE.—Grass Valley *Union*, Aug. 29th: Last Saturday one pan was cleaned up, after a run of five days with stamps. The yield was \$2,240.

### PLUMAS COUNTY.

NEW MILL.—Quincy *National*, Aug. 19th: A quartz mill of a capacity of 24 stamps, will shortly be put on the Cahalan ledge located on the hill between Crescent mills and Cherokee. The ledge is a fine one,

and the mill will undoubtedly be a paying institution.

WILL START UP.—The Crescent mill will commence crushing again in a short time.

### SAN BERNARDINO COUNTY.

By telegraph. On Friday, last week, a cloud burst in the mountains near the Temescal tin mines, San Bernardino county filling the shaft and all the gulches with water. No material damage was done.

### SIERRA COUNTY.

TWENTY-FIVE OUNCE.—Downieville *Messenger*, Aug. 26: A miner working in Ladies' canon recently found a 25-ounce nugget of gold.

### SISKIYOU COUNTY.

SLICES ROBBED.—Yreka *Journal*, Aug. 26: Romine & Co.'s sluice boxes on Humbug, were robbed Friday night, a week ago, by Chinamen.

FOR HUMBUG.—A party of gentlemen arrived in town Monday last, for the purpose of visiting the Siskiyou Co.'s quartz ledge on Humbug, and to examine it thoroughly and satisfy themselves that it will pay to bring up their mill.

### SAN DIEGO COUNTY.

We learn that the quartz mines in San Diego county are steadily improving, and experienced men venture to predict that the yield next year will not be less than \$500,000.

### TULARE COUNTY.

Considerable excitement is being occasioned by the discovery of rich quartz throughout the foothills east of town. The mountains are being thoroughly prospected and many claims located.

## Nevada.

### EUREKA DISTRICT.

BULLION SHIPPED.—Austin *Reveille*, Aug. 24th: The Manhattan Co. shipped this morning 15 bars, averaging over 100 pounds each.

AMALGAM.—4,200 pounds of amalgam were retorted at the Manhattan mill yesterday in 12 hours.

NEW ORE CHAMBER.—Eureka *Sentinel*, Aug. 20th: Day before yesterday the workmen in the Buckeye mine of the consolidated Co., struck a new ore chamber north of the north shaft, that is very rich. It is 3 ft. in width and already uncovered a distance of 30 ft. Several assays show \$130 in gold to the ton.

STRIKE IN THE CONSOLIDATED.—Same, Aug. 23d: This afternoon, ore was struck in the bottom of the main shaft of the Buckeye. This shaft has a depth of 160 ft., and cut in its progress three distinct strata of rich lead, gold and silver bearing ore. The extent of this strike cannot yet be determined.

STRIKE IN THE BULLWHACKER.—Yesterday the workmen found a "streak" running through the main body of ore, about six inches wide, and assaying \$2,000 per ton. It shows indication of continuance.

CHAMPION MINE AT DIAMOND.—There is a body of ore of great value, and large quantity in the shaft at 100 ft. deep, and the tunnel is also in good ore. Exploration is going on with good results. The owners intend to erect a furnace.

### ELY DISTRICT.

BULLION SHIPPED.—Pioche *Record*, Aug. 26th: W. F. & Co. shipped since our last issue, bullion valued at \$49,308.91, and (same paper Aug. 26th,) for 4 days ending Aug. 24th \$57,921.24.

SIX DAYS' RUN.—For six days ending Saturday last, the Raymond & Ely Mill, at Bullionville, produced bullion valued at \$25,674.98. The mines of this company are at present raising sufficient ore to run several custom mills in addition to their own 20-stamp mill.

OUR MINES throughout the whole dist., are looking extremely well on the lower levels, and the quality and quantity of the ore raised is constantly increasing. The dumps are all full and the teams hauling to the mill cannot keep them clear. Since the advent of steam engines, the amount of ore raised where they are used has been doubled, and sinking and prospecting is also being pushed rapidly ahead. New discoveries of large bodies of ore are constantly being made, and private claims are looking up and inviting attention.

### HUMBOLDT.

BULLION SHIPMENT.—Unionville, *Silver State*, Aug. 26th: The amount of bullion shipped from the Arizona mine, through W. F. & Co., since our last issue, was \$7,462.

SEMINOLE CO.—This Co. located in Eagle Canon, is prosecuting work in the tunnel. It has been driven ahead a sufficient distance to cut the front lead of the series claimed, without attaining that object. This is not discouraging in view of the fact that ledges seldom run any considera-

ble distance with mathematical accuracy.

NEARING COMPLETION.—The roasting furnace being built by the Arizona Association, and the tramway to the mine is to be ready for use in 20 days.

REPORTED STRIKE.—There is a rumor that a large and rich vein of ore has been struck in the Alpha mine, 3 miles south of Rye Patch.

IMPORTANT SALE.—Capt. T. Comins, of Dun Glen, has sold the following named mines to an English Co. for \$26,400; Bowen & Corning, Record, Nelson and Grass Valley, located in Sierra Dis., Humboldt Co.

DUN GLEN.—Sprague & Co., are erecting a new mill, for treating gold-bearing quartz, under a process patented by B. Paul. There are six mines in the neighborhood now being vigorously worked, all of which promise encouragingly.

TRINITY MINE.—Galena Cor. Humboldt *Register*, Aug. 26th: They have a body of chloride ore between 3½ and 4 ft. wide, high grade, intermixed with galena which carries heavy in silver.

WHITE MINE.—They continue taking out rich ore and plenty of it, and have struck a large vein of the 'silver wire' hearing ore in the first level. From the first and second levels they are drifting, working with the ledge northerly.

SHILOH MINE.—They continue sinking in the main shaft and from the 100 ft. level they are drifting, following the vein of rich mineral in sight.

BLACK HAWK.—They have about 8 or 10 inches of mineral (chloride) resembling the Butte ore and of high grade.

McBeth & Andrew are not working the Buena Vista, having transferred their men to the extension of the Little Giant at Battle Mt., which they think will pan out as well as the original 'Hope-so.'

BROOKLYN.—Boys resume work next week, having struck rich rock.

MEREDITH.—Boys will resume work next week. The boys have a good prospect and rich ore in sight. Prospecting is being pushed ahead vigorously.

### WASHOE.

BULLION SHIPPED.—Virginia *Enterprise*, Aug. 27th: The Bank of California yesterday shipped \$20,000 in silver bars, principally from the Savage and Belcher mines. During the two previous days they shipped \$20,500, mostly from the Crown Point.

BELCHER CO., AGAIN SHIPPING BULLION. This Co., yesterday shipped through the Bank of California 4 bars of gold and silver bullion weighing 5,048 oz., worth \$12,529, showing over 50 per cent. gold.

NEW LEVEL ON THE YELLOW JACKET.—The incline being sunk for the opening of a new level in this mine was yesterday down 126 feet below the 1,000 foot level. An excellent streak of ore was struck last Saturday. Supt. Taylor sums it up as 14 feet of \$30 ore.

THE OPHIR SHAFT is down a distance of 970 feet.

SUTRO TUNNEL was in yesterday 2,461 ft. They are in hard rock, but it blasts well. No water is coming in at the face of the tunnel.

KENTUCK CO. are taking out 60 tons of ore a day, upon which they are running the Excelsior and Devil's Gate mills. The latter mill started up Wednesday.

CHOLLAR POTOSI are extracting 125 tons of ore per day, assaying \$44 per ton. A considerable prospecting is being done. The principal operations being conducted on the Potosi tunnel level, and the first station from the new shaft. Last week 903 tons of ore was extracted assaying \$44.20 per ton on the average.

GOULD AND CURRY MINE.—The body of ore found between the second and third stations, is proving more extensive than at first anticipated.

RESUMED OPERATIONS.—Work was resumed at the Imperial-Empire shaft yesterday.

QUINN MINE.—A shaft is down upon the lead to the depth of 30 feet and it is found to be quite as rich at that depth as it was at the surface. An assay of ore taken from the bottom and various places above in the shaft, showed it to contain the precious metals at the rate of \$773 per ton.

BIG DAM.—Gold Hill *News*, Aug. 25: The big dam to be erected on Carson river for the new Eureka mill, will contain 365,000 feet of lumber. It will be 172 feet long and 24 feet 8 inches high, curving up the river six feet, between the two abutments.

### WHITE PINE.

BULLION SHIPMENT.—W. P. *News*, Aug. 19th: Total shipment for the week 32 bars, weighing 1,432 lbs., valued at \$37,950. Eberhardt & Aurora Co. shipped 21 bars, independently of the above, valued at \$23,000.

WARD BEECHER.—The hoisting works

are still engaged in hoisting through the main hoisting shaft, from the Lady's chamber in the east workings.

NORTH AURORA.—This mine, has, like the Ward Beecher, an excess of ore, by which we mean, that there is more piled on the surface dumps, and broken down in the mine, than can be readily disposed of, it being actually in the way.

ENERHARDT.—Development work is being vigorously prosecuted, with fair prospects of soon striking ore. Working 20 men.

WARD BEECHER CONSOLIDATED.—The quality of the ore in the drift from the north shaft has improved greatly, and the ore in the main workings still continues of a high grade. Shipping ore daily to the Manhattan, and a large accumulation on the dumps of the mine. Working 65 men.

ST. JOHN DEL REY.—Owned by a San Francisco Co., working three men, to get the claim opened for proper working. The first quality ore goes about \$80 per ton.

O. H. TREASURE.—The ore in the south face of the big cut still continues of good quality, with some good ore in the bottom. Still shipping ore to the Swansea and Big Smoky mills. Working 70 men.

SILVER WAVE.—The drift from the bottom of the prospect shaft is in ledge matter. A small quantity of good ore on the dumps, but milling none at present. Working 15 men.

POST-HOLE, SUMMIT & NEVADA, AND SOUTH IOERBERG.—Shipping first-class ore to the Big Smoky mill, and piling low grade ore on the dumps. Working 8 men.

MAMMOTH.—The drift from the main shaft is now in ore of a fine quality. A quantity of good ore is now on the dumps.

SILVER WAVE.—Good milling ore at the 140 ft. level. Hoisting ore and piling on the dumps. Working 4 men.

SILVER WEDGE.—The drift from the bottom of the shaft has pierced what is believed to be the main ore channel, and is now in the body a distance of 40 ft. Good ore is being hoisted.

EAST SHEROYGAN.—Working a small force. We understand that this mine has been sold to an English Co.

SUNNYSIDE.—Good ore in the new east drift. Hoisting and piling ore, preparatory to milling.

MILLS.—Internal—Running 40 stamps on ore from the Ward Beecher and North Aurora.

Oasis—Running on ore from the Ward Beecher.

Swansea—Running on ore from the Original Hidden Treasure.

Manhattan—Running on ore from the Ward Beecher Consolidated.

Big Smoky—Running 10 stamps on ore from Hidden Treasure and other mines. The other 10 stamps are being altered from dry to wet crushers.

## Arizona.

PINE GROVE.—Prescott *Miner*, Aug. 19th: A new ledge named the Black Hawk has been discovered. It is 7 feet thick at the surface, and prospects well in gold and silver. Shroader and Nelson, say that the Del Pasco shaft was down some 80 feet, when they left Wednesday last, and that the ore, at that depth, was richer than any hitherto taken from the vein. The little mill was tried on some ore a few days ago, and gave great satisfaction.

The work of prospecting several lodges in Bradshaw and Pine Grove Dist. goes bravely on, with very favorable results. All the lodges are yielding good ore. The great Vulture lode is reported doing better than ever.

BEAUTIFUL SPECIMEN.—The richest pieces of silver ore and most beautiful clusters of wire silver, that eye ever gazed upon, were brought over from the Tiger lode on Thursday. It is to-day, the richest known silver mine.

MINES IN ARIZONA.—There is just now, considerable excitement existing in Nevada and Utah Territory in regard to mines in Arizona. That there are rich mines in that region does not admit of a doubt but until the government exterminates the Apaches there is but one way to develop the mines. That is for large companies to form and detail as guard, a sufficient number to repel any attack that the Indians may make, while the rest work the mines. We therefore advise adventurers and prospectors to remain where they are, until the government orders the troops to the frontier, where they properly belong. Without a large force of soldiers Arizona is not a safe place—in fact is a certain graveyard to the prospector.

EXCITEMENT ABOUT THE PINAL MINES.—As the Pinal mountain prospectors sweep over the country, their numbers increase. They came via of Bradshaw and Sacator. On their arrival at the Gila, August, 7th,

consult William C. Coker, 27, New Montgomery street, under the Grand Hotel, San Francisco.

## PATENTS & INVENTIONS.

### Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING AUGUST 15TH.

CAR-COUPLING.—Perry W. Davis, Portland, Oregon.

SASH-HOLDER.—Thomas Jennings McCarver, Oregon City, Oregon.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

### ROAD STEAMER IN NEW YORK.

BY OUR NEW YORK EDITOR.

In the East, road steamers are a good deal of a novelty. A few have been built from time to time, run for a year or two and then broken up or laid aside. The most of them have come under the head of experiments. Steam road rollers are rather more common and practical. New York city has one which is in constant use on the Boulevards. Brooklyn has another in practical operation, built from designs by Mr. J. K. Fisher, of this city. Hartford, Conn., recently imported one of Messrs. Aveling & Porter's steam road rollers from England. The owners of the Dura pavement have a roller designed and built by Mr. Richard (?) Baxter, Jr., if we remember rightly. This little machine is quite handy and has been doing very fair work in pavement laying in this city. Its distinctive feature is a furnace which keeps the roller constantly hot, a necessary requirement in the work it has to perform.

Mr. Richard Dugon of this city, owns a passenger steamer for common roads. It was built by him several years ago, and is used occasionally, though not often. It is carefully taken care of and is always ready to fire up should the proprietor wish to make a trip.

This machine completes the list of working road engines in the Eastern States, so far as we know.

A few days since—during the last week in July—Mr. Oastler, the agent in America for Messrs. Aveling & Porter, dropped into our sanctum and informed us that he had just received a 5½ ton traction engine from England, and would be pleased to have us attend its first trial in America which would take place in a few days. In due season the notice came and we hurried off to the ferry to take the train to Waverly where the trial was to take place. It is of no use to tell our readers where the town is situated nor how to get there, because in the first place it is situated in "foreign parts"—to wit, in New Jersey; and secondly because it is distant at least a forty minutes' ride by rail from the city.

The Fair ground outside of its race course has a large circuit of ordinary dirt road, and upon this road the trial was to take place. After taking a lunch and getting ourselves into the best of humor we walked to the ground and found the steamer all ready for the trial with steam up.

#### Description and Trial of the Engine.

In general appearance, the engine is somewhat like the portable steam engines mounted on wheels that are used for driving portable saw mills. The wheels are about 18 inches broad. The driving wheels are five feet in diameter and the forward or leading ones scant four. We did not measure them but speak simply from memory. The iron tires of the driving wheels are armed with oblique cleats of boiler plate, and have holes for the insertion of iron spikes when occasion requires.

There is a single cylinder and a large fly-wheel to enable the engine to pass the centers. The water tank, coal bunkers and drivers station are at the rear of the boiler, and project so far as to throw the greater part of the weight upon the driving wheels,

only enough coming upon the leading wheels to enable them to guide the engine. The steering wheel is at the engineer's right hand so that he can guide the machine without difficulty while attending to his other duties.

The connection between the engine and driving wheels is by gearing so arranged that in turning, either wheel can revolve faster or slower than the other, while the engine exerts equal force on each. The valve is worked by an ordinary link motion with the usual locomotive reversing lever.

The inner wheel describes a circle about six feet in diameter when making the sharpest turns. The engine was run at various speeds, up hill and down, along levels, over grass land and around in small circles. At special request of the party the "driver" ran the engine up a sharp grade covered with grass. The inclination was, judged by the eye, one in five, at any rate it was as great as any one would wish to meet with a loaded team. It did this with ease and seemed well under control, and a handy engine to handle.

To recapitulate—the engine weighs 5½ tons, costs \$3,500, is of 26 indicated horsepower, is capable of pulling a load of 12 tons, besides its own weight, on ordinary roads, up grades of one in twelve at an expense of 300 pounds of coal per ten hours steaming.

The road bed over which it passed was of dirt and seemed improved by its passage. For the life of us we cannot see why engines of this kind are not profitable investments for men who have heavy teaming to do over ordinary roads. These engines can certainly go anywhere that it would be safe or prudent for a man to go with a loaded team.

We shall next week give an account of a competitive trial of traction engines in England, in which a sister engine to the one here described took the first premium. It will be of interest as it shows conclusively what such engines are capable of doing when pushed to their utmost.

#### "They've Come!"

Many amusing anecdotes are told at Washington of the late Commissioner of Agriculture, Mr. Newton—who was possessed of some remarkable traits of character. We were lately told of one that happened during the excitement of the late war, which we think has never been in print. On a certain occasion he hurried to the lobby of the House, and desired his card to be delivered to Speaker Colfax. The messenger informed Mr. Newton the speaker was then particularly engaged, and unless his business was very important, Mr. Colfax would hardly wish to be disturbed. "Important! very important," hurriedly exclaimed the Commissioner.

Mr. Colfax called a member to the chair, and hastened to the lobby—where Father Newton, in an excited manner, tapped him on the shoulder, and whispered—"They've come!"—"Who's come?" anxiously inquired Mr. Colfax. "The turnip seed."

The Speaker could not avoid his well known and characteristic smile as he wheeled upon his heel and returned to his official post.

IMPROVING THE QUINCE.—A correspondent of Tilton's *Journal of Horticulture* in urging that more attention should be paid to improving our various fruits and flowers, suggests that with care and patience we may yet obtain a quince as melting, palatable and digestible as pears. What a grand fruit we should have, if such a result could be obtained—if we could retain the flavor and aroma of the present quince and add them to the soft, melting juice pulps of the peach or pear! Such a result is by no means improbable. Less labor has probably been devoted to improving the quince than has been bestowed on any other fruit of the temperate zone.

THE LATEST THING ON SKATES.—Professor Lovett, the expert skater and manager of Woodward's Skating Rink, is having a Pedespede or one-wheeled skate made, on which he will in future give his skating exhibitions. The wheels are some eighteen inches in diameter, and the skate is strapped to the side of the leg.

WHILE gold is worth seventeen dollars per ounce, fine blonde hair readily commands twenty-five.

### The Snow Plant.

Along the western slope of the Sierra Nevada, and close to the line of the snow, there grows a strikingly interesting plant, commonly known as the Snow Plant. It was first discovered by the naturalist connected with Col. Fremont's party, in 1843 and 1844; but first brought to the notice of botanists by Dr. Torrey, in "*Plante Fremontiana*," where its history and true botanical character and position is given together with a plate.

Dr. Torrey described it under the name of *Sarcodes Sanguinea*. A new genus of the small sub-order *Monotropace* of the

THE CALIFORNIA SNOW PLANT.

natural family *Ericaceæ*. Its specific name aptly refers to its bloody or rosy color. The entire plant being of a succulent, fleshy texture, of from six to eighteen inches in height; growing under pine trees, generally starting up about the time the snow melts. It is sometimes seen growing up through the thin stratum of snow, and hence the popular name which has been given to it. It depends for moisture upon the melting snow. It resembles asparagus, somewhat in its form of growth, is equally succulent, and we have heard it stated, that when boiled and served up in the manner of that vegetable it is palatable and nourishing. The figure which we herewith present has been drawn and engraved for this paper from a photograph and is very little reduced in size from nature.

It has been found as far north as Lassen's Butte in Northern California, and abounds in the Yosemite valley, where its remarkable appearance attracts the attention of the commonest observer. Travelers crossing the Sierras early in the spring find the plant for sale at the way stations, as a floral curiosity.

It seems to be parasitic, and has not thus far been known in cultivation. We have known a specimen transferred to this city, which, by careful attention, and frequent watering with very cold water, increased some little in height and came into bloom; but soon withered and died.

The flowers are frequently brought to this city, where they are kept in vases of ice water, putting out flowers freely for several weeks.

A CHEAP ARTESIAN WELL.—The Kern County *Courier* of a late date says that Mr. Elias Dearborn, in the extreme southern portion of that county, while recently searching for pasture for his stock, found a locality where there was plenty of feed but no water. Thinking that there must be water near the surface to support the grass, he commenced digging and after going down about nine feet through moist clay struck a quick sand, which was too wet and loose to dig into. He then took a rake handle to probe the sand, and found but little difficulty in thrusting it down about eight feet. On withdrawing it, the water followed with such force that he was compelled to hasten out of the shaft which was soon filled so as to overflow, which it still continues to do—suitable curbing having been put down to the sand.

It is thought that this discovery will lead to the opening up of an immense tract of grazing land in that vicinity.

NEW POSTAL CAR.—The Central Pacific Railway shops of Sacramento recently turned out, from the paint shop, No. 1 of the new railway postal cars. Heretofore the mail agents on the overland road had half a car, Wells, Fargo & Co. having the other half. In this half they had to distribute letters, papers, sleep and live; but while so confined the through mail was packed into a baggage car. The exterior of these new cars is being constructed under the advice and suggestions of Mr. Alexander, of the Post Office Department, and is in every way as convenient as can well be imagined. In one end of the car are large pigeon-holes or boxes for papers, which together contain the names of every postoffice on the route from Ogden to San Francisco, both inclusive, so arranged that the distributor, standing in one place, has every box under his hand. Opposite these, and before reaching the middle of the car, are the boxes for the letters. In the center of the car is the route agent's room—with wash-stand, water closet, bunk for two, wardrobe, etc. In this there can be a stove, upon and by which the route agents can do their own cooking. The remainder of the car, nearly half, is set apart for through mail. No. 1 of these cars has left the paint shop—No. 2 goes into the paint shop to-day, and the Chief of Construction, Mr. Welch, has orders to turn more of them out as fast as he can, until there shall be one for every through train.—*Sacramento Bee*.

### America no Place For Fools.

In a lecture lately delivered before the London Farmers' Club, Mr. James Howard, the well-known manufacturer of implements, of Bedford, England, made the following pointed remarks concerning his experience in a recent visit to the United States. He said he had been profoundly impressed with the happiness, prosperity, energy, intelligence and self government of the American people. He wondered that so many people were willing to remain in the Old World, without a chance to rise, with hardly a chance to exist. If the United States were as crowded as England is, the population would be nearly a thousand millions. In reply, however, to the question whether he thought large and opulent farmers would do well to send their sons to America, he remarked, that one of the first memoranda which he made in his diary, after seeing the United States, was, that "it was no use to send a fool to America." Mr. Howard hit the nail on the head.

## USEFUL INFORMATION.

**CONDENSED MILK.**—All the public hospitals and charitable institutions of New York city are now supplied with condensed milk by the Am. Cond. Milk Co. The amount thus supplied reaches a monthly value of about \$3,000. A uniform quality is required according to a fixed standard established and ascertained by assay. Every 100 quarts of condensed milk represents 430 quarts of good milk direct from the cow.

The process of condensing is very simple. The milk is first strained, then heated to 145° F. in a water bath, again strained and then condensed in a copper vacuum pan in which the temperature marks from 105° to 113° F. The pan receives 425 gallons at a charge, and the condensation requires 2½. 50m. The milk is supplied daily as is the case with the ordinary mode of supply. By the condensation a large cost is saved in transportation while a uniform quality is more readily secured, and any variation from the fixed standard more readily detected.

**PHOSPHATES IN RUSSIA.**—An important discovery of phosphates has been made near St Petersburg. The bed resembles that in South Carolina, but is less in extent. This discovery affords another evidence that immense stores of fertilizing minerals have been laid up in the laboratories of nature, against the time when the wants of man will demand a larger yield from the earth than can be obtained by even the most economic use of the fertilizers already in the soil, or which can be added from the annual produce of crops.

**FEEDING GOLD-FISH.**—It is a capital mistake to suppose that gold-fish in aquaria do not want feeding. They may live some months on what they can gain from the water, but they eventually die of starvation. We know a gentleman who has a large tank full of gold-fish, fresh-water sun-fish, etc., who feeds them with calf-liver. It is cut in small pieces, dried in a slow oven, and then pulverized. A very little of this is sprinkled on the water and is greedily consumed by the fish. We have kept fish for years without loss, except by accident, giving them nothing but farina in small quantities, but we have lately discovered that they like corn-meal even better. There is an objection to feeding fish much where they are kept in aquaria with plants, and where the water can not be changed often. The water is apt to become fouled, and, indeed, will become more or less so in spite of all precaution. As we like a clean tank, we have ceased to keep plants, but change the water once a week, washing the tank, shells, pebbles, and sand thoroughly. It is not very much trouble, and it is a great satisfaction to have the glass thoroughly clean and the water clear. We think our fish are much more lively and interesting than those in tanks where the water is not changed so often, and is but poorly furnished with oxygen by the plants. We have made considerable headway in taming our fish. *Hearth and Home.*

**GLASS AS A NON-CONDUCTOR OF HEAT.**—Glass, says the *Journal of the Telegraph*, is practically a non-conductor of heat as well as of electricity. A practical example of the latter may have been seen in the use of glass as an insulator, a non-conductor, for telegraphic purposes. It is difficult to draw the line of non-conduction, but had conductors of heat are practically assumed as non-conductors. The question of conduction is purely one of degree. Let two rods of equal size and length—but one of copper and the other of glass—be brought together, and have at their extremity a small weight or marble attached by wax. Apply a spirit-lamp to their ends, touching each other so that the heat be equally applied; in the case of the copper, owing to its being a good conductor, the wax will rapidly melt and let the weight drop; while in the case of the glass, owing to its being a very bad conductor, a very long time must elapse before such a result can happen.

**PATCHES** may be fastened upon rubber boots and shoes, or cracks and rents closed up, with a cement made by dissolving rubber cut fine, in benzine.

**THE ABSORBENT POWERS OF A MELLOW SOIL.**—Experiments have shown that a mellow, loamy soil is capable of absorbing in twelve hours, when exposed to a moist atmosphere, an amount of water equal to two per cent. of its weight. If any argument were needed to keep the soil mellow, here is a most powerful one to induce us. For this property possessed by a mellow soil is one that in a dry season is able to give it the power of maturing a crop, when a hardened surface would be unable to do so. A surface that is impenetrable to the atmosphere, of course could not absorb any of the moisture with which the atmosphere is charged. But when rendered free from lumps by repeated plowings and harrowings, each change of temperature causes a circulation of air throughout the mass of soil, which is free then to absorb all the moisture coming in contact with it until it is saturated. So, then, the more the soil is mellowed by cultivation, the less it is injuriously affected by drouth, and the better it is enabled to mature a fair crop in spite of the absence of rain. *Hearth and Home.*

**PELICAN OIL.**—The people of Louisiana and Mississippi have originated a new source of wealth in capturing and obtaining the oil from the innumerable pelicans which frequent that portion of the Gulf coast. The business of capturing the birds and extracting their oil extends to Bay St. Louis, on the gulf coast, westward following the coast, and thence to the Belize. A fleet of small vessels are employed, and find there remuneration profitable. And the supply of birds is reported to be inexhaustible. Should they give out for any reason where they are now hunted, there are swamps they never desert, and there are the islands above, on which they are often seen in myriads.

**A SINGULAR ANT.**—Probably the most curious ant in the world is the parasol ant of the West Indies, if the accounts which we receive of its habits are correct. Dr. Forbes Winslow, in his work on Light, referring to Mrs. Somerville as his authority, says that these ants walk in long procession, each one carrying a cut leaf over his head as a parasol, in the sun, and they deposit these in holes ten or twelve feet under ground, apparently with no other object than to form a comfortable nest for a species of white snake which is invariably found coiled up among them on digging up the deposit.

**A NEW TELEGRAPH POLE.**—A proposed substitute for the present heavy telegraph pole has recently been patented. This new pole is made of galvanized iron tubes, which can be packed one within the other like a telescope, and therefore can be transported to distant points with great ease and at a moderate cost. For a pole standing fifteen feet out of the ground the first section is three inches in diameter, the second section two inches and a half, and the third section one inch and a quarter. The iron pole, with insulating arms, it is stated always insures a perfect current of electricity, and its substitution in place of the unsightly wooden poles is recommended.

**HOW TO KNOW AN IMITATION FROM A REAL DIAMOND.**—The real diamond, though brilliant, is not transparent. When a diamond is polished, but before it is set, its genuineness may be ascertained by laying it on a newspaper. If the stone hides the letters, it is real; if they shine through and are visible, the "diamond" is paste, rock crystal or other imitation.

**PALE SAPPHIRES** may be rendered entirely colorless by exposure to intense heat; they thus also acquire great brilliancy and are sometimes passed off as diamonds.

**A HEALTHY MAN** throws off daily an average of 120 grains of carbon, and 21 of nitrogen, which must be supplied to him, or he will weaken and finally perish.

**SEWING machines** are driven by steam power in Stewart's dry goods store and other large establishments in New York.

**THE bamboo** is said to grow at the extraordinary rate of four inches in twenty-four hours.

**A TANNERY** 100 by 600 feet, to contain 1,200 vats, is being erected at Grand Lake Stream, Maine.

**BUTTERFLIES** have been found flying at sea, six hundred miles from land.

## GOOD HEALTH.

## Babies in Bran.

According to the London *Lancet*, a plan has generally been adopted in France of placing babies in bran. An ordinary cradle is filled with common bran, a hair pillow is put in, and then the baby is moved aside with the hands until a hollow is formed the size of the child's body. The infant, divested of everything below the waist, and having a little bedclo or cape above that, is placed in the bran and its body completely covered with it, exactly as may be seen at the seaside at the present time, where children play at burying one another in the sand. A light coverlet or counterpane is placed above all, and the baby is in bed for the night. The two great advantages connected with bran are said to be its particular cleanliness and the pleasant and even temperature which it maintains about the infant's body. There seems to be no good reason, says an English paper, why this privilege, if it possesses these advantages, should be confined to the small portion of humanity. Bran might be used instead of bedding in casual wards, common lodging houses, and would be preferable to the dirty beds to be found at seaside lodgings. Perhaps the day is not far distant when the sojourner at the seaside will take his carpet bag, a folding box and a bag of bran, and bid defiance to dirt, fleas and infection.

**EXPERIMENTS WITH ONIONS.**—J. B. Wolf, M. D. of Washington, lately forwarded to the Farmer's Club, N. Y., the following communication: On shipboard at New Orleans, in the year 1849, in charge of one hundred marines, with cholera among them, I observed that those who ate freely of onions, supposing them to be healthy, were attacked certainly and fatally. Onions and salt cured the bite of a rattlesnake on my son, and are considered specific in all snake bites. I have found four separate witnesses of phenomena connected with small-pox and fevers:

1. Onions in rooms with small-pox rot rapidly.
2. Blisters rise in them.
3. They retain and communicate the virus many weeks after the epidemic has subsided.
4. Applied to the feet of fever patients they rapidly turn black.
5. They prevent the spread of small-pox in thickly populated tenements by absorbing the virus.

6. A man with hydropothia, in his frenzy ate voraciously of them and recovered.

- From all these facts may be deduced:
1. That onions should not be eaten when there is a prevailing epidemic.
  2. That onions sliced and frequently changed are good disinfectants.
  3. That experiments should be made to test of their usefulness. For many years I have opposed vaccination as ordinarily done, and hence hail with satisfaction any means of mitigating the virus of this distemper.

**POSTURE OF THE HEAD IN SLEEPING.**—It is often a question among people who are unacquainted with anatomy and physiology whether lying with the head exalted, or on a level with the body is the more unwholesome. Most people consulting their own case on this point, argue in favor of that which they prefer. Now although many delight in holstering up their heads at night, and sleep soundly without injury, yet we declare it to be a dangerous habit. The vessels in which the blood passes from the heart to the head are always lessened in their cavities when the head is resting in bed, higher than the body; therefore, in all diseases attended with fever, the head ought to be pretty nearly on a level with the body; and people ought to accustom themselves to sleep thus and avoid the danger.

**WARM BATHING.**—The warm bath is a grand remedy, and will often prevent the most virulent of diseases. A person who may be in fear of having received infection of any kind, should speedily plunge into a warm bath, suffer perspiration to ensue, and then rub dry, and dress securely to guard against taking cold. If the system has imbibed any infectious matter, it will certainly be removed by this process if it be resorted to before the infection has time to spread over the system; and even if some time has elapsed, the drenching perspiration that may be induced in a hot bath will be pretty sure to remove it. *Family Herald.*

## Children Should go to Bed Early.

Many children, instead of being plump and fresh as a peach, are as withered and wrinkled as last year's apples, because they do not sleep enough. Some physicians think that the bones grow only during sleep. This I can not say, certainly, but I do know that these little folks who sit up late at night are usually nervous, weak, small and sickly.

The reason you need more sleep than your parents is, because you have to grow and they do not. They can use up the food they eat in thinking, talking and walking, while you should save some of yours for growing. You ought to sleep a great deal; if you do not, you will in activity consume all you eat, and have none, or not enough, to grow with.

Very few smart children excel, or even equal, other people when they grow up. Why is this? Because their heads, if not their bodies, are kept too busy; so that they cannot sleep, rest, and grow strong in body and brain. Now, when your mother says Susie, or Georgie, or whatever your name may be, it is time to go to bed, do not worry her by begging to sit up "just a little longer."

But hurry off to your chamber, remembering that you have a great deal of sleeping and growing to do to make you a healthy, bappy, and useful man or woman. *Etc.*

**FOOD MEDICINE.**—Dr. Hall relates the case of a man who was cured of biliousness by going without his supper and drinking freely of lemonade. Every morning, says the doctor, this patient rose with wonderful sense of rest and refreshment, and a feeling as though the blood had been literally washed, cleansed and cooled by the lemonade and the fast. His theory is that food will be used as a remedy for many diseases successfully. As an example, he cures cases of spitting blood by the use of salt; epilepsy and yellow fever by watermelon; kidney affections, by celery; poison, olive and sweet oil; erysipelas, pounded cranberries applied to the parts affected; hydropothia, onions, etc. So the way to keep in good health is really to know what to eat, not what medicine to take.

**SALT IN THE HUMAN SYSTEM.**—A scientific gentleman in Scotland states that 57 per cent. of the saline matter of the blood consists of common salt, and as this is partly evolved every day through the skin and kidneys, the necessity of continued supplies of it to the healthy body is sufficiently obvious. The bile also contains soda (one of the ingredients of salt), as a special and indispensable constituent, and so do all the cartilages of the body. Stint the supply of salt, and neither will the bile be able properly to assist digestion, nor the cartilages to be built up again as they naturally waste. It is better to place salt where stock can have free access to it.

**A MAN** will die for want of air in five minutes, for want of sleep in ten days, for want of water in a week, for want of food at varying intervals, dependent on constitution, habits of life, and the circumstances of the occasion. Instances have been given where persons have been said to live many weeks without eating a particle of food, but when opportunities have been offered for a fair investigation of the case, it has been invariably found that a weak and wicked fraud has been at the bottom of it.

**DEATH FROM MULBERRIES.**—Five persons have recently been found dead in Mississippi under mulberry trees. Death in all these cases has been attributed to eating mulberries which have been impregnated by locusts. In the stomach of one colored boy, says the Woodville *Republican*, was found a quantity of mulberry seeds and the locust eggs. Two children in Wilkinson county are also reported to have died from eating plums similarly impregnated.

**CARE OF THE HAIR.**—Frequent brushing and washing once a week with a teaspoonful of liquid ammonia in a bowlful of warm water, is said to be the best treatment possible for the hair. If any stimulant is required, half an ounce of dry ammonia, rubbed into a pint of olive oil, is the finest dressing to be made, and prevents hair from turning gray, if anything will, and urges its growth.

**EATING BEFORE RETIRING.**—It is very injurious to eat just before retiring. The desire for it is simply the result of habit or of a morbid craving—and should be at once overcome.

**COTTON IN YOLO.**—The Woodland Democrat says that the Railroad company planted, last spring, about two acres of cotton, as an experiment on the unclaimed tule land above Knight's Landing. The seed was the Sea Island variety and imported. It was supposed to be somewhat imperfect, as it did not germinate as evenly and quickly as was expected. However, a tolerably good stand was produced and about 1½ of the two acres looks very promising. It is about three feet high. The growth of the stock is very rapid. Persons familiar with cotton growing pronounce the prospects very flattering, and believe this soil to be admirably adapted to the growth of this staple; although the experiment has not been a fair one either in planting or after cultivation.

**NEW PATENT FIRE HOSE AND TRIAL.**—The city authorities of Marysville, recently purchased 2,000 feet of patent combination steam fire hose from the Gutta Percha Rubber Manufacturing Company of New York, which company has an agency in this city, in charge of Messrs. Taylor & Sullivan. Nineteen hundred feet of this hose was recently subjected to a very severe trial at Marysville, when a pressure of 370 pounds failed to find a weak spot. The hose when subjected to this great pressure, resembled more the appearance of an iron pipe than a rubber combination. The test was highly satisfactory to the city authorities and the large number of firemen and citizens who witnessed it.

**MORE SECOND CROPS.**—About 2,000 acres of land on Sherman Island, from which a crop of grain was harvested in June, was immediately flooded, allowed to settle for two weeks, then plowed and harrowed for a volunteer crop of hay which will be cut about the 20th of October.

## Home Manufactures.

For more than twenty years the opinion has been current, and often the theme of both common conversation and elaborate essays, that California can never become a manufacturing country. For this grave and foreboding opinion three formal reasons are given, viz: that the country does not produce the raw material; that our distance from producing countries is so great that transportation of the raw material would cost us so much that we could not compete with others; and that if we had the material, the price of labor is so high as to be absolutely prohibitory.

These premises being true, the conclusion would be necessary; but are they? If any one of them is not true, or only partially true, the conclusion will necessarily be modified. If they are all fallacious, the conclusion falls to the ground. Let us examine somewhat carefully, for the importance of the subject to the future of our State is absolutely vital.

*First*—Do we not produce the raw material?

Of wheat, the market reports of the principal cities and the most populous nations on the globe, attest our ability to supply in almost unlimited quantities. And the manufactures from wheat are by no means confined to flour and breadstuffs. The starch for our ten thousand laundries, and the preservative spirits of every medicine chest, and the stimulants of every sick chamber in the civilized world, are, in no inconsiderable measure, drawn from this staple product.

Of wool, we produce enough to supply, in no small degree, the large manufactories of the East, and that, too, at highly remunerative prices. So eminently is this true, that if present prices could be guaranteed for the next seven years, California would, before that time, produce more than is now produced in the whole United States.

Of hides and skins for leather, the horns for combs and the hoofs for glue, largely used in Eastern manufactories, we supply a large amount.

Our ability to produce cotton and flax is fully demonstrated, while our product of grapes—the substratum of different manufactures—is unquestioned and unrivalled.

But in the department of wood fit for manufacturing purposes, it has been most boldly and persistently asserted that we do not and cannot produce it. This idea is, however, rapidly yielding to the stubborn argument of facts. The panel work in our State Capitol, from the native woods of our hills, has attracted the marked attention and praise of persons of the highest culture, fresh from the examination of the best work in the capitols and palaces of Europe. The locust and the bodach, grown everywhere on our bottom lands with great readiness and vigor, are not surpassed in any part of the world for excellence in the manufacture of all kinds of wagons and carriages.

It is evident from these facts, pertaining to only a few of our many productions, that the first premise—inability to produce—is a fallacy. It is proposed, in future brief articles, to show that the others are equally so.

**ARRIVED.**—Prof. W. P. Blake, M. E., recently arrived from the East, having been absent from the Pacific Coast since 1867, a portion of which time he has spent in Washington, in the employ of the U. S. Government compiling the reports of the Paris Exposition. It will be remembered that the Professor represented California as State Commissioner at the World's Fair.

**ILLUSTRATIONS.**—J. H. Andrews' Gang Plow; Matteson & Williamson's Gang Plow; Edmund Higgings' Self-opening Gate; Vestal's Wagon Axle Gauge, and several other California inventions will soon be illustrated in the Press.

## NOTES AT THE S. F. MECHANICS' INSTITUTE FAIR.

[In these articles we have room only to notice briefly such articles as come specially under our observation. More replete descriptions of the most interesting and instructive exhibits will be given in the Press in our greater leisure hereafter. No classified catalogue being published we do not in this number give complete notices in any particular department.]

A FARM GATE, practical in every particular that we can see, is exhibited by M. Bartel, and described in our notices of recent inventions. An enterprising manufacturer can make money out of this invention here and in the Eastern States—we think.

HUNTER & WEISTER'S SEPARATOR is the simplest and cheapest successfully operating grain cleaner in the world. The grain is separated from foul seed and foreign substances by a series of inclined screens receiving rapid concussions by means of cams and springs. It runs easy, is light and easily handled. No fan is employed in it.

THE NOVELTY FANNING MILL—R. Stone, agent, S. F.—has been illustrated and described in the SCIENTIFIC PRESS as a first class mill for thorough and complete separation and cleaning. We always find it working well and satisfactory. Good construction and completeness are the points claimed for it.

NASH & CUTT'S FANNING MILL AND SEPARATOR, is exhibited by Nash, King, Miller & Co., of Sacramento. It is a well tried and we believe favorably considered apparatus at home. A wide range of work is claimed for it, rendering it an extended field of usefulness for cleaning all kinds of grain, peas, beans, corn, etc. The better preparation of our cereals for market, and especially for seeding, by the extended use of this class of machinery is worthy of all encouragement.

EUREKA CHURN, by E. Grout, Napa, has two series of fingers or stirrers placed in the manner of folded hands or fingers, working in opposite directions back and forth in the cream, by a hand lever.

A NEW METHOD OF PRESERVING FRUIT in jars, by exhausting the air is effected by a novel apparatus invented by D. N. Phelps. His experiments are worthy of a more extended notice than we are now giving, and will receive attention hereafter.

THE PACIFIC POTTERY, of N. Clark & Co., Sacramento, have a good display, and are alone in their wide range of useful home manufactures.

A POULTRY FOUNTAIN is a new device made by the above firm. It consists of an earthen bottle having a minute hole at the bottom. This is set into an earthen tray of about 2½ inches greater diameter than the bottle. The bottle filled, corked tight at the top, and placed in the tray will discharge water into the same until the small supply hole is covered, when the discharge will cease for reason that the air is cut off from supplying the vacuum necessarily formed in the bottle. As soon, however, as the fowls lower the water in the tray the bottle will give down a fresh supply.

WINE CASKS.—Messrs. Fulda & Sons, as a leading cooperage firm of this city, exhibit samples of their mammoth work unsurpassed by any country. Our great wine interests have brought out much skill in this branch of home industry, and Mr. L. R. Fulda (a young member of the firm) has patented, and is still procuring patents, for inventions calculated to do work in his line by machinery to greater advantage than has hitherto been attempted.

HORTICULTURAL.—In the horticultural exhibition, Mr. D. L. Perkins, of Sherman Island, has added to his prominent display, the following:—Water melons, 3 varieties; cantelopes, 3 do.; beans, green, 5 do.; tomatoes, 3 do.; beets, 3 do.; cucumbers, 3 do.; squashes, 2 do.; carrots, 1 do.; onions, 1 do.; potatoes, 3 do.

Among the cantelopes we find a variety called the Magnesia, a very lato keeper, being in good condition for the table about the 1st of January. The sample exhibited is not more than half grown. Mr. Perkins thinks that for sugar it has no superior, being very heavy, and full of saccharine.

Amongst the potatoes we find the Climax, a new variety of whites. Also the four-pound Trophy tomato. All these vegetables were growing on his ranch on Monday afternoon and were in the Fair on Tuesday evening.

GEO. A. LLOYD'S STAMP MILL is still operating, crushing quartz to a fine flour with remarkable rapidity for the size of its stamps. The springs attached to the stamps send them home with a velocity and power worth imitating and trying on a larger scale.

CROCKER'S TRIP HAMMER QUARTZ CRUSHER meets with outspoken favor by some of our best posted mining operators. Several persons have signified their intentions to adopt it.

C. H. Foster, a San Francisco inventor, exhibits an earthquake proof truss and a design for an iron roof.

MANN'S EARTHQUAKE PROOF CHIMNEY is exhibited by Tay, Brooks & Backus. It consists of an ornamental iron fire-place lined with brick or concrete, and two sizes of sheet iron pipes, one encircled by the other with sufficient space between for about one inch of cement filling. These pipes are made in sections and kept on hand so that a fire-place chimney can be purchased and erected about as quickly as an ordinary stone and pipe can be set in place. With imitation marble or japanned mantles they are capable of being made quite ornamental.

FORD'S HOOK AND EYE MACHINE, the very ingenious California invention, which many would like to have seen taken the inventor's gold medal at the last fair, is seen each evening converting coiled wire into both hooks and eyes at the same instant with a completeness and rapidity truly astonishing to the crowd which always surrounds it. It is equalled by no machine of its class in the world.

THE SAN FRANCISCO GLASS WORKS, Newman & Venal, proprietors, have a fine display, including the best glass ware we have had our attention directed to as home made. White, green, amber, purple, blue and black are included in its colors. Fine white vials from ¼ to 16 ozs., lamp chimneys, fish globes, siphons, tubes, retorts and other apparatus wares are shown equal if not superior to the imported wares. Many articles are made with special regard to the requirements of this coast, and are furnished to better advantage to customers than they could otherwise be procured. Mr. Newman, an old hand from the glass ware center of Pittsburgh, Pa., has been once burned out but will not stay down. Such men and home enterprises should be appreciated in our new community. Mr. Newman has patented an improved glass melting pot, a fruit can, besides other inventions.

BEDSTEAD FASTENER.—E. T. Barlow, by an improvement in clamps, renders bedsteads perfectly secure at all hours of sleeping or waking. He inserts an iron hook in the mortices in the posts, into which fit the clamps of the side rails of the former, which are made instantly adjustable and secure. It makes a stronger joint than the old style by a very cheap device.

BOSTON AGENCY.—T. C. Evans, No. 106 Washington street, Boston, will receive subscriptions and advertisements for our paper. We have known Mr. Evans as a reliable newspaper advertising agent for 10 years.

SHEEP FOR ALASKA.—It is proposed to send some sheep to Alaska with the view of acclimatizing them in our northern possession.

## GEYSER CANON\*.

The accompanying cut is a general view of the far-famed Geyser Cañon, one of the great natural curiosities of our much-to-be-admired State.

The Geyser springs are situated among the hills in Sonoma county, about 100 miles from San Francisco, and are so easy of access that not only tourists, but the people in our own community, should not fail to visit them. The view of the Geyser from the hotel is grand in the extreme, especially in the early morning, when the dense volume of steam can be seen rising in majestic columns from the cañon in the distance; but when the sun is up, the cloud is less dense, it being speedily evaporated.

Leaving the hotel, which is situated at the base of the hill among the timber, you pass up the rocky trail to the summit and thence down into the Geyser Cañon, the subject of our sketch. The first spring that attracts attention is the "Steamboat Geyser," on the side hill, so called from the noise it makes, resembling that of a steamer "blowing off." The steam escapes through a hole in the rocks about two feet square, as if from under great pressure, and in fact makes more noise than any spring in the cañon. It is dangerous for a stranger to approach too close, for the steam is so overheated that it is invisible until some distance in the air, and a slight change in the direction of the wind might be attended with serious consequences.

Below and in the center of the cañon is the "Witches' Cauldron," formed by four large rocks, and the water which is of inky blackness, is continually bubbling up with great noise, so as to render conversation in the vicinity impracticable. This is aptly named and one might easily imagine in the dusk of evening, the three witches crouching

"Double, double, toil and trouble"

around this infernal kettle, in this appropriately wild and unearthly spot. The vapor from this spring deposits a black sediment on all the rocks in the vicinity.

The "Devil's Pulpit" is next in order, at the head of the cañon on the hill. The hotel may be seen from this point and a fine view obtained of the Geysers themselves. The ground is hollow and trembles under the footstep, so that a timid spectator might well suppose this to be a favorite resort of his satanic majesty. The "Lovers' Retreat" is a quiet, secluded spot, surrounded by foliage, beside which the stream murmurs placidly on its way to the sea. A fallen tree serves for a seat, to those romantic enough to spend an hour here, and two large stones may be used as foot-stools.

Among the smaller springs, which are numerous, are the "Devil's Tea-Kettle" and the "Devil's Ink-Bottle," from the latter of which issues a liquid which can be, and is, used for writing purposes; but which on being left quietly in a bottle precipitates a black, sulphurous substance, leaving the liquid as colorless as water. The stream moving down the cañon is cold at its source, but gradually becomes warmer, from the numerous springs of different gradation of temperature which empty into it. Boiling water, and that cold enough to drink can be seen issuing from the gourd in the space of a foot. The rocks and ground are heated so that in many places it is impossible to stand for any length of time, and as for sitting,—just try it. The old orator on the trail from the "Lovers' Retreat" to the hotel is worthy of a visit, the ground in the vicinity being covered with sulphur, sometimes beautifully crystallized, and as we walk, an undulating motion is perceptible, and it sounds hollow and vibratory, so as to make one "brush up" his philosophy and begin to calculate on the thickness of the earth's crust, and the possibility of its breaking through.

The chemical substances are various and in abundance. There is a large chalk bed, another of a substance they call "putty," which is soft under the foot and can be kneaded in the hand. Epsom salts, alum, "devil's ink," magnesia, alum waters, a liquid they call, in the locality, eye water, copperas, iron water, cinnamon and quantities of sulphur of course.

This locality will please not only a lover of nature, from the grandness of the scenery, but scientific men who are capable of divining the mysterious causes of these springs, can enjoy it as a study. It is said that the winter is the best time for a visit. There are two routes, one *via* Petaluma and Healdsburg, and the other, by taking the steamer 'Capital' to Vallejo, thence by cars to Calistoga (always worthy of a visit), and then, by Foss' line of stages, over a romantic and delightful road about 28 miles, to the Geysers. The latter is the one most generally traveled.

\*Our illustration is from the Scenes and Wonders of California, by J. M. Hutchings. A. Roman & Co., Publishers, San Francisco.

## Faulkner's Improved Punch.

This invention (the patent for which was secured through the SCIENTIFIC PRESS PATENT AGENCY) relates to improvements

GEYSER CANON.

in stationary punches, such as are used for perforating leather, metal or other substances. The improvements consist, first, of a movable die, in which are holes of different sizes, which can be revolved so as to bring any size under the punch; second,

FAULKNER'S IMPROVED PUNCH.

the manner of attaching and operating the punch so that it can be readily removed or changed for one of a different size when necessary.

The body of the punch is constructed in the ordinary manner. By referring to the accompanying illustration, it will be seen that the movable die is secured in any required position by a spring, passing from the body of the punch, having a "pawl" which holds the die in its place by slots placed in the proper positions. The punch stem is provided with an enlarged head, which rests on the upper side of the

movable block, as can be seen by the section marked by dotted lines in the cut. The manner of swinging back the front of the machine for the purpose of removing the punch, can also be seen by reference to these dotted lines. The advantage of this invention is, that it provides a punch which can easily and quickly be adjusted so as to make any size of hole without removing and changing the die plate. The whole machine is no larger than an ordinary punch, and the improvements can readily be seen by any person familiar with those now in use.

## Work at the Foundries.

We understand that the San Francisco Boiler works, 125 Beale street, have recently completed two large boilers for the Crown Point mine, Gold Hill, Nevada, two for the Steam Plow Propeller Co., and one each, as follows:—Steamer Newbern; Idaho mine, Grass Valley; Oakland Gas Co.; Tubbs Hotel, Brooklyn; Pacific Brewery, in this city, and Donnelly's Yeast Powder manufactory.

We are informed that the Oakland Gas works are being enlarged and remodelled in the most substantial manner. The castings for the same which are all of new

mining interests will continue to grow until mining will rank with merchandising, agriculture, and manufactures. There should be no more risk attached to mining than to any other branch of industry, and the time is not far distant when the business of mining will be entrusted to safe, practical, and competent men. When this course is strictly adhered to, there will not be as many failures in mining heralded through the country.

## Important Mining Sales.

H. Gutierrez, of the Stock Exchange, London, paid out on Monday last, \$200,000 on the purchase of the "Independence" mine, at Sierra Buttes, Sierra county. Mr. G. has also bought the "Pacific" mine at Placerville, Cal., and is interested in the purchase of the Buel and Bateman property at Bingham Cañon, Utah, at \$400,000, made some three weeks ago. Several other prominent mines have been bonded to this gentleman for sale, which are likely to go into English hands. He brought his own mining engineer, Capt. Bray, of London. They both return to England this week after a quiet but very important visit.

Thus some of the very best and safest of our mining property is passing into foreign hands. We have the satisfaction of knowing, however, that there are plenty of the same kind yet undeveloped.

## The Prevention of Boiler Scale.

From the best information we can obtain we believe that the public is at last offered a cheap and effective remedy for most of the causes of incrustation of boilers. The remedy consists simply in introducing a small per cent. of the volatile alkali-ammonia, and thus breaking up the flinty carbonates of iron and lime into a fine powder which is readily washed or blown out of the boiler. In another column will be found an advertisement of this "Ammoniacal Preparation." It is manufactured by the San Francisco Gas Company, and sold by Mr. Curry, the well-known proprietor of the San Francisco Boiler Works.

Lengthy and careful trials in a 20-horse power boiler, at the Vulcan Iron Works, have developed the important facts that it does not injure the iron, while it does remove old scale and prevent the formation of new with the most satisfactory rapidity and completeness.

Some months ago Mr. Smedberg published a note upon the subject in one of our daily papers which foreshadowed the results of later and extended practical experiment; and the argument is closed, so far as any question of the efficiency of this preparation is concerned. With the water commonly used here, a pint per day of this preparation suffices to keep a 20-horse boiler perfectly clean. The cost is mere nominal, as will be seen by reference as above. Our mining companies, many of whom are seriously troubled in this way, would do well to test this preparation, and learn its virtues by the light of actual trial.

PROF. J. A. WHITNEY, editor of the *American Artisan*, N. Y., paid a brief visit to San Francisco, last week. On his way hither he took a look at the mines of Virginia City, attended the Mechanics' Institute Fair here, passed through the U. S. Branch mint, and we presume carries home copious notes from which he will elaborate numerous editorials for the *Artisan*.

ARSENIC SPRING.—A number of men employed at the Cement Hill mine, near Nevada, became mysteriously sick, says the *Nevada Transcript* of the 18th inst., showing symptoms of having taken poison. They had been drinking freely from a spring of clear cold water, near the mine, and with one or two exceptions, all who drank of the water became sick. This induced Mr. Stranahan, the Superintendent of the mine, to have some of the water of the spring analyzed, and it was found to be strongly impregnated with arsenic. It is said one gallon of the water contains sufficient arsenic to poison half a dozen men.

patterns from designs by Mr. Smedberg of the S. F. Gas works, are being turned out by Thompson Bros., of the Eureka Foundry, 131 Beale street. The boiler, roof, and iron work are from the San Francisco Boiler Works, 125 Beale street.

A walking beam engine of 8-horse power is to be built for the same, at the machine works of Messrs. Hawkins & Cantrell, 210 Beale street, in this city.

## Mining Schools Among the Miners.

Slowly but surely an improved interest is beginning to be felt by the public at large, both here and at the East, in behalf of mining education. As an evidence of the truth of this remark we may mention the fact that there has recently been quite a large delegation of Professors and students from the Technological Schools of the East, now in Colorado, for the purpose of making the mines a study. The manner in which this is done is indicated by the *Central City Register*, as follows:—

Each student has assigned him a special mine, mill or other subject to report upon. All the results of their investigations are to be printed and preserved for future reference. The present trip is too expensive to be repeated every year. This fact suggests much in favor of establishing a School of Mines in Colorado, where the students can have this experience, which is acknowledged by the Professors now among us, to be of great and lasting advantage to their students. There is nothing more plain than this fact, and our people should agitate this matter, until a School of Mines shall have been established in our territory. No one doubts at this age of mining development, that America is destined to rival any other country on the globe in mineral wealth, in the quantity, variety, and richness of its minerals. We shall have need of a large army of skilled laborers and managers, metallurgists and geologists. Our

## DOMESTIC ECONOMY.

### Pastry.

In making pastry, the cook should be particularly clean and neat. Her utensils should be kept in order, and when they are done with, should be carefully cleaned and put in their places. Her pasteboard and rolling-pin, let it be remembered, should after using be well scoured with hot water alone. A marble slab is preferable to a board for rolling paste. Both are generally made too small to be convenient. Three feet long by two feet wide is a good size. In making a paste, a good cook will have no waste of any kind, and particularly, she will not make more at one time than she wants, under the idea that she can keep it in flour till the next time of making, for it is ten to one but that the old paste will spoil the new. No flour except the very best can be used for fine descriptions of pastry, and in damp weather it should be dried before the fire, but not scorched. Clarified dripping, good lard, marrow, salt or butter well washed, may be used for ordinary pastry; indeed, if they are pure and sweet, they will form good pastry, with good flour and good management. In families, however, where economy is not an object, and everything for the table is required to be of the first quality, the safest plan is to use the best fresh butter. The fat that settles on stews, and on the broth in which meat has been boiled, may be used for pastry, that is, provided it is tasteless. Suet is sometimes used for meat pies, but though it makes a light crust when hot, it does not eat well when cold.

A great deal more butter, or fat of some kind or other, was formerly directed to be used in making pastry than at present. For ordinary purposes, half the weight of lard, or butter is sufficient, but in the richest crusts the quantity should never exceed the weight of flour. Eggs may be added to enrich the crust. Use no more water or other liquid in making paste than is absolutely necessary; or, in other words, take care not to "put out the miller's eye," that is, to make the paste too moist. The great thing is to incorporate the flour well with the fat, which you cannot do if you allow too much water or milk in the first instance.

The under or side crust, which should be thin, should not be made so rich as the top crust, as otherwise it will make the gravy or syrup greasy. All dishes in which pieces are to be baked should be buttered or greased round the edges, to prevent the crust from sticking, and if there be an under crust, all over the inside; the same must be done with tins or saucers.

**OUR KITCHENS.**—You are fortunate if your kitchens have a sunny outlook. A south window catches all the precious winter sunshine, and is not as uncomfortable on account of heat in the summer as an east or west window. Sunshine goes a great way towards furnishing a room, as well as driving care, fatigue and disease away from those who live and work in it. Of course, you may not all have model kitchens, though you may so much desire them; and just here comes to mind this quaint old rhyme, which applies to housekeepers, as much as to any other class:

"For every evil under the sun  
There is a remedy, or there is none.  
If there be one, try and find it;  
If there be none, never mind it."

**CURRENT WINE.**—Gather full ripe currants on a dry day, pick them from the stalks and weigh them; then crush them with your hands, leaving none whole. For every two pounds of currants put one quart of water; stir all well together and let it stand three hours, and strain the liquor through a sieve; then for every three pounds of currants put one pound of powdered loaf sugar; stir it till the sugar is dissolved, boil it and keep skimming it as long as any scum will rise. Let it stand sixteen hours to cool before you put it in the cask, stop that very close. If the quantity be twenty gallons, let it stand three weeks before you bottle it; if it be thirty gallons, it must remain a month; it should be perfectly clear when drawn off. Put a lump of sugar in each bottle, cork it well and keep it in a cool place or it will turn sour. This is a pleasant and cheap wine, and if properly made will keep good for many years; it makes an agreeable beverage for the sick, when mixed with water.

**TO STEW TOMATOES.**—Pour boiling water over fair and fully ripe tomatoes, that you may peel them quickly; let the water remain only long enough to start the skin. When peeled, cut into a porcelain-lined kettle, as tin or iron turns them dark, and gives them a bad taste. If onions are agreeable, cut one small one in with the tomatoes. Cover closely, and set where they will gently simmer, but not boil hard. Stir them occasionally to prevent burning, and when they have cooked two hours, add pepper and salt to suit your taste, and to a quart of tomatoes add a teaspoonful and a half of sugar, and  $\frac{2}{3}$  even spoonful of bread or cracker crumbs. After the crumbs are added stir often or they will stick to the bottom of the dish and soon burn. Twenty minutes before dinner beat two eggs, or if you have more than a quart of tomatoes, increase the number in proportion of two eggs to a quart; stir briskly, and often after the eggs are added, and serve hot. If possible, the tomatoes should be skinned and set on the back part of the stove before breakfast, as the longer they simmer, the better they will be. Three hours' slow cooking at least—five is better. If prepared according to rule, they are thought very nice by tomato lovers, and are better warmed over the second day than the first.

**CUCUMBER SALAD.**—Take a dozen ripe "White Spine" cucumbers and pick, wash, pare, and cut into strips, taking out the seeds; then to each dozen cucumbers—which we cut up into pieces like small dice—put twelve large white onions, chopped, six large green peppers, also chopped, one quarter pound each black and white mustard seed, and a gill of celery seed. Mix together, add a tea-cup of coarse salt, and hang up in a cotton bag to drain, for twenty-four hours. Then the salad, with enough cold cider vinegar added to cover it, is put into stone jars and fastened nearly air-tight. In six weeks it will be fit for use.—Mrs. S. J. H., in *Hearth and Home*.

**RASPBERRY VINEGAR.**—Put a pound of very fine ripe raspberries in a bowl, *bruise them well*, and pour upon them a quart of the best white wine vinegar; next day strain the liquor on a pound of fresh ripe raspberries, bruise them also, and the following day do the same, *but do not squeeze the fruit or you will make it ferment*, only drain the liquor as dry as you can from it. The last time pass it through a canvas bag previously wet with the vinegar, to prevent waste. Put the juice into a stone jar, with a pound of sugar to every pint of juice; the sugar must be broken into lumps; stir it, and when melted, put the jar into a pan of water; let it simmer, and then skim it; when cold, bottle it. It will be fine and thick when cold, and a most excellent syrup for making a wholesome drink.—*German Town Telegraph*.

**LAYING DOWN CUCUMBERS.**—The best way to lay down cucumbers is to sprinkle salt over them, and let them form their own brine. A board and stone should be laid over them, in order to keep them under the brine. If in three days there is not enough brine formed to cover the cucumbers, there is not salt enough on them and more should be added. They should never be allowed to protrude above the brine, as a white mold will form and they will soon soften. In cutting the cucumbers from the vine, leave a stem on the pickles. They keep better and appear better on the table.

**TO DO UP SHIRT BOSOMS.**—Take two ounces of fine white gum arabic powder, put it into a pitcher and pour on a pint of water and then having covered it, let it stand all night. In the morning pour it carefully from the dregs into a clean bottle, cork it and keep it for use. A tablespoonful of gum water poured in a pint of starch made in the usual manner, will give to lawn, either white or printed, a look of newness, when nothing else can restore them after they have been washed.

**HOW TO MAKE SEIDLITZ POWDERS.**—Seidlitz powders are an excellent corrective for acidity of the stomach; and every farmer can make them for himself. Mix twelve drams of powdered Epsom salts with twelve scruples of powder carbonate of soda, and divide into six parts in blue papers. Divide also into six parts, in white papers, four drams of Tartaric acid in six powders. Every time you take the powders, mix one of each paper in two glasses.

**TO DRY CITRON OR WATERMELON RIND.**—After preserving, place in the sun, and dry. They answer well in puddings and cakes as a substitute for the imported citron.

### Domestic Receipts.

**APPLE SNOW.**—Stew fine-flavored, sour apples; sweeten and flavor to suit your taste; strain, and to one quart of sifted apples allow the whites of four eggs. Whisk them to a stiff froth; then put the apples and whites together, and continue to whip until so stiff you can turn the dish upside down without the mass falling off. Eat with cream or with bread and milk.

**SCALLOPED TOMATOES.**—Peel and cut in slices a quarter of an inch thick. Pack in a pudding dish in alternate layers, with a force-meat made of bread crumbs, butter, salt, pepper, and a little white sugar. Spread thickly upon each stratum of tomatoes, and the dish is nearly full, put tomatoes uppermost, and a good bit of butter upon each slice. Dust with pepper and a little sugar. Strew with dry bread crumbs and bake covered, half an hour; remove the lid and bake brown.

**TOMATO SOUP.**— $\frac{2}{3}$  lbs. of veal or lamb, 1 gallon of water, 2 quarts of fresh tomatoes peeled and cut up fine. Boil the meat to shreds, and the water down to two quarts. Strain the liquor, put in the tomatoes, stirring them very hard, that they may dissolve thoroughly; boil half an hour. Season with parsley, or any herb you may prefer, add pepper and salt. Strain again and stir in a tablespoonful of butter, with a teaspoonful of white sugar, before putting into the tureen.

**BREAKFAST BISCUIT.**—Take a piece of risen bread dough, and work into it one beaten egg and a tablespoonful of butter or lard; when it is thoroughly amalgamated, flour your hands and make it into balls the size of an egg; rub a tin over with milk, and set them in a quick oven for twenty minutes, and serve them hot for breakfast. When eaten, break them open; to cut would make them heavy.

**BREAD-AND-BUTTER PUDDING.**—When dry bread is left, spread it with butter, and pile up the slices in a pudding-dish. Fill in with custard, add a few raisins. Bake long enough to cook the custard.

**PEACH LEATHER.**—Peel very ripe, soft peaches; mash them fine, and strain through a colander. If the peaches are not very sweet, add a little sugar. Butter well panes of glass, and spread the paste smoothly upon them. Put in the sun to dry; when dry on one side, turn it, and when perfectly dry, roll and keep in boxes. When not convenient to use the glass, butter strips of cloth, and spread upon well-seasoned boards.

### Mechanical Hints.

**TO LIGHT SHADED ROOMS.**—The London *Builder* recommends a plan for lighting a room in which the darkness is caused by its being situated on a narrow street or lane. If the glass of a window in such a room is placed several inches within the outer face of the wall, as is the general custom in building houses, it will admit very little light, that which it gets being only the reflection from the walls of the opposite houses. If, however, for the window be substituted another in which all the panes of glass are roughly ground on the outside, and flush with the outer wall, the light from the whole of the visible sky and the remotest parts of the opposite wall will be introduced into the apartment, reflected from the innumerable faces or facets which the rough grinding of glass has produced. The whole window will appear as if the sky were beyond it, and from every point of this luminous surface light will radiate into all parts of the room.

**TO DRAW POSTS FROM THE GROUND.**—Procure a long chain, attach it to the yoke, pass it around the base of the post, or the part where the earth has been thrown away, place a stout prop under the chain, inclining towards the post, then let the oxen draw. There are very few posts so tight in the ground that they cannot be easily removed by the strength of two stout oxen. In this way a long line of fence may be removed in a single day.

**TO REMOVE A SCREW FROM WOOD.**—Heat a piece of iron red hot and put it on the top of the screw for a minute or two, then take the screw-driver and you will easily get it out, if you do it while it is warm.

**STAINS** may be removed from silver spoons that have been used in administering medicine by rubbing them with a rag dipped in sulphuric acid and afterward washing thoroughly in soap-suds.

**THE FASTEST LOCOMOTIVE TIME.**—Locomotive No. 8, of the New Jersey railroad company, is said to be the fastest locomotive in the United States, having made eighty-nine miles in one hour.

## LIFE THOUGHTS.

NEVER part for a day without loving words to think of during absence.

To address man wisely you must not forget that his life is partly animal, subject to the same laws with nature.

THERE are a thousand pretty, engaging little ways which every person may put on without being affected or foppish.

THE worst people are most injured by slanderers; as we usually find that to be the best fruit, which the birds have been picking at.

LIFE is like a theatre. During the play we take higher and lower seats, but when it is over we mingle in the common stream and go home.

THERE are no pockets in shrouds, nor money drawers in coffins. But we accumulate good or bad capital for the other world for all that.

IT is easy enough to make sacrifices for those we love, but for our enemy we have to struggle and overcome self. Such a victory is noble.

A RARE audacity astonishes society—a remarkable instance disarms it. Society does not grant its admiration to those who creep in secret paths. Opinions in our day must be coerced, not led.

SHAKESPEARE says, "It is a good divine that follows his own instructions. I can easier teach twenty men what were to be done, than to be one of twenty to follow my own teachings."

ALL earth shows forth too nice and delicate an adaptation, too beautiful a continuation of cause and effect, to admit even a thought that the Creator has failed in His highest creation.

### Little Things of Life.

The little things of life are not to be despised. They are the threads that make its woof and warp, and the life is dark or bright accordingly as these little threads are black or golden. It is grains of sand that make the ocean heath, and globules of water that make up the ocean itself, and, singularly enough, these grains of sand, and these globules of water are, each, separate, detached and distinct. Each forms part of the mass, but each is by itself. Every life is a mass of a myriad of atoms; each day of the four score years that make it up is a teeming history of acts, words, adventures, incidents, relations, thoughts, hopes, griefs, fears and emotions, each standing by itself but all connected together.

We may not neglect these individual trifles, and expect the mass they compose to be satisfactory. Even a word or a tone of voice, may make a day bright or dark; the shadow on the face of a friend casually met, will reflect a shadow on our own heart, and give us a feeling of depression that we can not comprehend, and which can not be thrown off.

A letter containing a few brief lines, from an absent relative, will sometimes drive all the clouds from our sky and make the dreariest winter day as sweet as summer. We read the letter in an instant, cast it aside, and imagine it is forgotten—so trifling and foolish it is; but it is not forgotten; it floats like a radiance around us wherever we go; it makes us strong, buoyant, and hopeful.

Our moods have much to do with our happiness; they come over us like a bath of sunlight, or creep upon us like a dismal shadow—we can not tell how; but there is always a specific cause for them. It may be so minute as to escape attention in the mass of events and incidents that make up the day's history; but if we search patiently, we will generally discover that the joy that has attended us all day long had its source in some look of love, word of sympathy, or some gratifying success in the execution of a trifling task; and that the "blues" that haunt us, are the reflection from a cold face, or the result of some petty annoyance.

Happiness does not come to us in heaps, and it is foolish to imagine that we can by a great, heroic effort of perseverance and care, bring down an avalanche of it enough, to last a lifetime. Nor is it dependent on times and seasons; we can not be very happy at some distant day, by being very miserable, now. Joy comes in batches—sometimes, in specks, which we should make the most of while they last. It is like a scant shower of gold dust, scattered through our lives—not to make them all happy, but to relieve them of their heaviness and sorrow.

## Business Cards.

**JOHN ROACH, Optician.**  
Has removed from 322 Montgomery street to  
540 Washington street,  
East of Montgomery.  
Surveying Instruments made, repaired and adjusted  
22v17-3m

**Farmers and Mechanics  
BANK OF SAVINGS,**  
No. 225 Sansome Street.  
Interest paid on Deposits. Money Loaned on Real Estate.  
H. DUTTON, President.  
GEO. M. CONDEE Cashier. 19v16-3m

W. M. BARTLING. HENRY KIMBALL.

## DENSLOW & BUSH'S "SAFETY" OIL

**SAFETY OIL  
KNOWN**  
Will Not Explode!  
Stands a fire test over 15  
minutes. We take ordi-  
nary Kerosene 110° fire test,  
and re-distill it by our new  
process, rejecting fully 75  
percent (Benzine and Tar), the cause  
of all Kerosene explosions,  
bad odors, smoke, gas, etc.  
Our "SAFETY" Oil costs 1  
cent per hour, and a lighted  
lamp may be upset and bro-  
ken without fear of explosion  
or fire. The Fire Underwriters of N. Y. recommend its use  
as a protection to life and property. For sale by all grocers,  
druggists, etc., in the U. S. Extra inducements to dealers  
and agents. Address Denslow & Bush, 130 Maiden Lane,  
N. Y.; 8 Custom H. street, Boston, Mass.; 31 S. Calvert  
street, Baltimore, Md.; 51 S. Water street, Chicago, Ill.; or  
Cleveland, Ohio. P. S.—5 gallons expressed for \$3 to any  
place where not for sale. 8-213t

**DANA BICKFORD'S  
NEW IMPROVED FAMILY  
KNITTING MACHINE.**  
**\$1,000 TO \$5,000 A YEAR, AGENTS**  
can make in almost  
any section of the country, selling Dana Bickford's new  
and improved FAMILY KNITTING MACHINE. This Machine is  
guaranteed (in its present completeness) to meet every  
want of the household for either domestic or fancy work.  
Price \$25. Send stamped envelope with full directions  
for an illustrated hook. Address **DANA BICKFORD,**  
Vice-President and General Agent, 689 Broadway, N. Y.  
3v23-41fp

ING CARS** attached to express trains.  
**T. L. KIMBALL,**  
General Passenger Agent, Omaha.

### An American Hotel for Invalids.

There is a decided want in this city of a comfortable and well managed institution to which Americans and others, particularly strangers from the interior, who have means to pay their way, can repair, and be certain of good medical treatment and nursing. Such people are now compelled to resort to hotels, which are poor places at best, for invalids, and always more or less lacking in most of the essentials needed by them. We need a HOTEL for invalids, where people can repair without the appearance of seeking charity, and where they can find accommodations suitable for their needs and means.

In view of these facts it is proposed to found an institution, modelled somewhat after the plan of the *Maisons de Sante* of Paris.

Such an institution should unite the qualities of a good hotel and a first-class hospital. It should be located outside of the din and bustle of the city, and in the midst of pleasant, ornamental grounds.

In order that people of different circumstances and means may be accommodated—as at different classes of hotels, it is proposed to establish two such "Hotels," to be under American auspices and control, and to be open for the reception and treatment of all invalids willing and able to pay the charges of board, medical and other attendance, etc. The plan is for

#### 1st.—A First-Class Hotel for Invalids,

In which the charges would range from \$3 per day for a single room, to \$8 per day for a suite of three rooms. This hotel would be fitted and managed so as to satisfy the most fastidious persons, and would correspond with the best class of the Paris "Maisons de Sante."

#### 2d.—A Second-Class Hotel for Invalids

In which the charge would range from \$1 per day in one of the large wards, to \$2.50 per day in a first-class single room. For style and object, this hotel would correspond with St. Mary's, German, Italian and French hospitals of the city. It would be the sanitary resort for persons of small or moderate means—mechanics, small employes, miners, and the laboring classes generally; and would, it is presumed, be very available for such societies, as the American and British Benevolent, Masons, Odd Fellows, Redmen, Pioneers, Israelites, and such like societies, also for such churches and congregations as have no private hospitals of their own. The building could be so constructed as to furnish, at reduced rates, suites of rooms or wards to different societies and denominations where they could minister to their members in their own way. They could also provide their own physicians and nurses, and obtain, in consequence, a greater reduction in the rates.

#### Both Establishments,

(Either of which could, if thought best, be founded first and in different localities) to be managed by a Board of Trustees, composed of a number of our best business men. This project, which is submitted to the consideration of our public spirited capitalists, could be carried out by an association, which might be known as "The American Hotel for Invalids' Association." The capital for such a scheme would range from \$100,000 to \$250,000, according to the extensiveness of the plans. We understand that several of our prominent citizens have already expressed a willingness to unite with others in an association for such a purpose.

The above is only an outline of a plan which might be modified to suit the views of parties who might take an active interest in the enterprise. There is no city in the world, in proportion to its population, where such an institution is so much needed as in San Francisco; and mainly for the reason that this is the only point

on the entire Pacific coast where invalids especially in the absence of homes and home associations, can go for proper treatment and care. Aside from the humanitarian nature of the proposition, there is but little doubt but what such an institution could be made to pay as an investment. We trust the idea may be carried out, with that liberal and public spirited enterprise which always characterizes whatever is undertaken by the solid men of this city.

**A HERMET ON TWITCHEL ISLAND.**—The *Antioch Ledger* says that on the northern side of Twitchel Island near the bank of the Sacramento there has lived alone, without neighbor, kith or kin, for four years a man named Russel. Fascinated with the beauty of the spot, this eccentric individual, who by occupation is a trapper, built for himself a convenient house, surrounding it with an orchard, vineyard, ornamental trees, etc., and until recently, he was like Alexander Selkirk, "monarch of all he surveyed." When the tax was levied for the construction of a levee around the island he paid his apportionment on two hundred acres which he had purchased of the State, but requested that his home should not be inclosed, desiring the benefit of the river's overflow. Mr. Russel has engaged extensively in bee raising and annually ships large quantities of honey to San Francisco, which he finds a profitable business.

**EDITORS PRESS:**—Can you tell us why the flea powders, so much used on this coast, are death to insects and harmless to the touch (and perhaps taste) of individuals?

Because they act merely upon the respiratory organs of the insect. They are not "poisonous" in the usual sense of that term. They simply close up the breathing organs of insects, by mechanically obstructing the passage of the air thereto.

MR. WM. H. MURRAY, special corresponding agent for the *SCIENTIFIC PRESS* and the *PACIFIC RURAL PRESS* of San Francisco, arrived in Elko on Wednesday, and is still engaged as usual in the interest of the two excellent papers mentioned, and we are glad to learn that he has been meeting with gratifying success. Mr. Murray comes here from the eastward, having just completed an extended tour through Utah and Colorado. He left here to visit Railroad District; and from thence will go to Mineral Hill, Eureka and White Pine. Having canvassed those mining regions, he then proposes to inspect Cope and wend his way through Idaho. Mr. Murray has also been exerting himself in the interest of the great Industrial Fair to be held in San Francisco on the 8th instant, and hopes a good showing of minerals of Nevada will be made. Contributions of minerals and metals from the mines of Nevada will be given a prominent place and will be labeled, and will attract attention and capital to our mines. Wells, Fargo & Co. will forward, free of charge, all packages addressed to the Mechanics' Institute, care of J. H. Gilmore, San Francisco. *Independent, Elko, 5th.*

#### Premium for New Subscriptions.

There are many persons not familiar with the value of the Press who would ever after be thankful to our present subscribers for bringing their names on to our list of intelligent readers. Large additions can be made with little effort by the many in this way. We therefore offer (post paid) a premium of one of the patent newspaper file holders (advertised in this paper) for every two new subscriptions received with \$8 advanced payment.

#### Our Printed Mail List.

Subscribers will notice that the figures found on the right of the pasted slips, represent the date to which they have paid. For instance, 21st/70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4/72, that he has paid to the 4th of January, 1872; 4/73, to the 4th of July, 1873. The inverted figures occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction. Please notify us if you are not properly credited within two weeks after paying.

#### Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by using Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

### A Good Binder for \$1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for \$1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Sent postage free. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the Press.

THE SAN FRANCISCO SCIENTIFIC PRESS of July 29th has a well written communication from Mr. Murray, its agent, giving a truthful description of Golden and its resources. In connection with it is a sectional cut of our coal beds, which is an important accompaniment. The Press is an excellent paper, and is doing much in the dissemination of knowledge of our growing west. —*Transcript, Golden, Col.*

COPIES WANTED OF THE SCIENTIFIC PRESS OF JANUARY 7, 1871. We will pay 25 cents per copy, at this office, and also feel obliged to the sender.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$57.50. Part of the money may be paid in installments by a person who gives good recommendations in the city, or in the country near San Francisco. To be seen at John I. Tay's, Broadway, Oakland.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

N. Seibert's Eureka Lubricators for steam cylinders are acknowledged by 160 engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not run or gum, and will pay for themselves in a short time, in the saving of oil, over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First street, San Francisco. 8/23-3m

**CURE FOR COUGH OR COLD.**—As soon as there is the slightest uneasiness of the Chest, with difficulty of breathing, or indications of Cough, take during the day a few "Brown's Bronchial Troches." Containing demulcent ingredients, they allay Pulmonary Irritation. Have them in readiness upon the first appearance of a Cold or Cough.
